Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Getting the Most from the Index

This year a change has been made in the indexing of articles relating to maintenance practice and equipment. The large number of articles brought out on the monthly maintenance data sheets, together with the increasing number of maintenance notes in other issues, seemed to make such a change desirable. Three new keywords have been introduced: (1) Maintenance data, under which all articles appearing on the monthly maintenance data sheets are grouped; (2) Maintenance equipment, with classified subheads, under which all articles in the weekly department "New Equipment" are included, and (3) Maintenance practice, also with classified subheads, under which all articles in the weekly department "Maintenance Notes," as well as the articles on the data sheets, are inserted. In view of this change, the heading "Repair Shop Practice" has been reserved in this index only for general articles on repair shop methods, and the heading "Repair Shops and Equipment" for general articles on the design of repair shops and their equipment.

Otherwise the plan used for many years in the preparation of this index has been followed. It is essentially a subject index, not an index of titles, and articles treating a number of different subjects are listed under each of them. In addition, a geographical reference is published wherever the article relates to any particular railway company, city, state or nation. Entries about an electric railway are under the name of the city in which the main office of the company is located.

In the subject index, the alphabetical method is followed. If there is a choice of two or three keywords the one most generally used has been selected, cross references being supplied. The headings which appear in the index itself are in small type under the general classifications. The main headings in capitals below do not appear in the index.

As an example of how to use the index, if a reader wishes to locate an article on special trackwork he obviously would look in the list below at the general subject "Track." Under this caption, only "Special trackwork" could apply to the article in question.

In addition to the groups of articles covered by these headings, papers and reports from railway associations are grouped under the names of the various organizations. Proceedings of other associations and societies are indexed in general only in accordance with the subject discussed.

Signed articles also are indexed by the name of the author. When the name of the author is known to the reader this provides the simplest method of locating any article.

CLASSIFIED LIST OF KEYWORDS

ACCIDENTS AND ACCIDENT PREVENTION
Accident claim department
Accident prevention
Accidents (including wrecks)
Insurance, Fire
Safety work
Storm and fire damage

ELECTRIC CARS AND SERVICE CARS
Cars (including car design)
Locomotives
Service and tower trucks
Trackless trolley

CAR EQUIPMENT
Bearings
Brakes and compressors
Doors, car
Electrical equipment for cars (except motors)
Gears and pinions
Heaters, electric
Lighting and lighting fixtures
Motors, Electric
Resistors
Seats
Trolley wheels
Trucks
Wheels and axles

Motor Vehicle Taxes Need Revision

VARIATIONS are so great in the taxes paid by motor vehicles in different states that the need for some revision is clearly indicated. No good reason is evident why the license fee in Missouri for a 20-passenger bus weighing 9,000 lb. should be less than that of a 5-passenger automobile weighing 3,000 lb., while in California the bus license costs 170 times as much as the automobile license. If the relationship between the two tax rates is reasonable in one of these states it must be grossly unfair in the other. The inequalities of the present arrangement were brought out strikingly in an address made by Henry R. Trumbower, professor of economics University of Wisconsin, at the recent convention of the Motor Bus Division of the American Automobile Association. An abstract of his address appears elsewhere in this issue.

Many years ago it was common practice to make the highway users pay for the benefits received. Toll roads were built and operated on this theory. As time went by the viewpoint changed and toll roads began to disappear. Streets and highways were considered as public improvements which should be paid for from general taxation in the same way as schools, etc. Recently another change of opinion has occurred and the motor vehicle, which has become the chief user of the roads, is looked upon as a source of revenue from which to defray a large part of the highway expenses. In 1926 approximately $1,500,000,000 was spent in the United States for construction and maintenance of streets and highways. Motor vehicle revenues collected by the states amounted to about $400,000,000, according to Professor Trumbower.

During the past five years the states have come to rely more and more on the gasoline tax as a source of funds for highway purposes. The number of states levying this tax has not only increased year by year, but the rates themselves have been raised by the states that early adopted the tax. Last year 44 states and the District of Columbia collected gasoline taxes ranging from 1 cent per gallon to 5 cents. Of the $400,000 raised by taxation of motor vehicles, 46 per cent was derived from gasoline taxes and 54 per cent from license fees. Since the beginning of the present year New Jersey has adopted the gasoline tax, and it has come close to adoption in New York, Illinois and Massachusetts, the three other states that were without this form of impost in 1926. From this it appears probable that gasoline taxes will soon become the chief source of revenue derived from motor vehicles.

It is obvious that neither a tax on gasoline nor a flat license fee corresponds accurately with the destructive effect of the operation of the vehicle. The former fails to take into account important factors such as weight, springs and tires, all of which directly affect the wear and tear on the pavement. The latter neglects the mileage covered, which also directly affects the wear. That sufficient scientific study has not been given to these matters is shown by the wide divergence in the methods of taxation now in use.

Records Still Being Made in Pittsburgh

ECONOMIC conditions the past year in Pittsburgh were not good, but despite this the Pittsburgh Railways, the Coffin Prize winner of two years ago, made a most creditable record for the year. Passenger revenue was smaller by $113,998 per cent than in 1925, but the railway succeeded by close supervision, economies and competent labor in effecting a reduction of $137,344 in operating expenses exclusive of taxes. This it did at the same time that it furnished the people of the Pittsburgh territory 1,668,599 more car-miles, carrying 26,000,000 more riders than in 1925, thereby bringing the average fare per ride to 5.37 cents, compared with 6.73 in 1923 and 5.78 in 1925.

Between the lines of the report one reads the reasons why the company was successful in winning the Coffin award, for the document speaks for itself on the relation of the railway with the public, with the employees and with the communities that it serves. It discloses the disposition of the company to do everything within its power adequately to serve the territory in which it operates. This is evidenced tangibly in many ways, but most notably, perhaps, by the fact that last year alone the company placed in operation 50 new cars, bringing the total up to 378 put into service since the railway came out of receivership in 1924. This, of course, takes no account of the vast amount of overhauling and rehabilitation of cars carried out meanwhile.

An activity of the company which deserves particular attention is the operation of buses. At the beginning of the year 22 coaches of various makes and types were owned. During the year nineteen coaches were purchased and seven were sold. The total number of coaches owned at the close of the year was 34, including eight double-deck vehicles. Moreover, coach operation has been successful financially, the net income for the year being $17,093. The base fare for this service is 25 cents. This is a service to which extended reference has been made before in the ELECTRIC RAILWAY JOURNAL, particularly in a paper read at the recent meeting of the C.E.R.A. Rightly enough, the management is pleased with the prospects for bus operation.

Despite all that has been accomplished, many other things remain to be done. Among them the company still has before it the plan of readjustment of the capital structure, the purpose of which is to bring into one consolidated company the ownership of all leased and operated properties so as to simplify the present situa-

Digitized by Google

tion. This is one of those arrangements which the committee on finance of the American Electric Railway Association recommended several years ago be carried out to the lasting benefit of the companies involved and the industry as a whole. It would be fulsome, indeed, to commend the work of this company were it not for the benefit of the example of accomplishments it is setting for the rest of the industry.

Cotton May Be King Again

COTTON enters into many of the products consumed by the electric railways. So the industry will do well to keep its eye on cotton. From all accounts it is likely to become king again. During the last few months there has been a remarkable change in the statistical position of this commodity. Prices as quoted by the Guaranty Trust Company of New York reveal that raw cotton at New Orleans advanced in price from an average of 12¼ cents per pound last December to 16½ cents on June 1. Also, that the quotation at the end of 1926 was the lowest for five years and was 7 cents a pound, or 36½ per cent, below the level a year earlier.

Further to gage the situation, one must consider the cotton crop in the light of the visible supply. As far as the United States is concerned, the crop is only a little in excess of that of a year ago. On the other hand, stocks of American cotton in foreign countries are more than twice as large. In addition, there has been a small gain in the supply of foreign cotton. Many authorities interpret this as an indication that foreign manufacturers have taken advantage of the low prices during the current season to build up their stocks of raw material.

Such an opinion was expressed in the Guaranty *Survey* for June, which calls attention to the fact that the size of a crop is by far the most variable factor influencing the movement of cotton prices, "and that the entire cotton situation may be and frequently is radically changed in a very short time by conditions that can neither be controlled nor foreseen." This authority, in commenting on the outlook for the crop, calls attention to the uncertainty occasioned by the Mississippi flood. Private estimates of acreage reduction from last year, it points out, are being roughly averaged as 10 or 11 per cent. There is also the added factor that a late start inevitably exposes the crop to unusual hazards, both from weather and from insects.

It seems timely that a note of warning be sounded with respect to the whole situation. Purchasing agents may well consider the trends when preparing their buying schedules.

There's Much in the Viewpoint

SICKNESS and health depend so often on the frame of mind of the individual that many doctors treat their patients by the power of suggestion, without medicine. On the contrary, if a patient concentrates on his troubles, his physical condition usually becomes worse. The same is true of many electric railways, particularly in the smaller communities. It is in these that automobile competition is at its height, and where in any event it is most difficult to get the public to patronize the service. Naturally the manager is likely to become discouraged. When that happens the problem of the road is greatly magnified, and the attitude of the management soon is reflected in the run-down condition of the property. On a recent trip the writer was confronted with this attitude from a number of managements: "We have done everything we could, but the people will not support us. We have exhausted every means of increasing revenue and cutting expenses. We don't know what to do next." In all these towns the service given was infrequent, the cars and track more or less decrepit, and the employees indifferent. People tolerated the street railway, but looked on it as a poor relation, hardly worthy of help.

How different was the situation in one city! The smallest of the group visited, it was the one where the cars were new and bright. All the track had been rebuilt within recent years, and the headway was the most frequent. The fares were low. What is more, the public patronized the cars. The company was earning a return on the investment, whereas the others were barely making operating expenses. The general manager was busy on the day of the visit, as in his capacity as president of the commercial organization he was arranging for a dinner that evening to boost the city. But he did find time to say, "We have faith in the railway. The public is with us and we are with it. We are not afraid of the automobile. People travel more and we get more business."

Not every manager has the courage, the enthusiasm and the perseverance to do equally well, but the instances of properties that have been able to obtain results like this show that there is the opportunity—even in the smaller cities—to furnish public transportation and to do it at a profit. The discouraged manager can well take stock and see if he really has done everything, or if he has made the mistake of failing to win the confidence and support of his public, for without it he cannot hope to prosper.

What Will Toledo Do About It?

TOLEDO needs new street railway operating conditions. This work has been apparent for months. Despite this the work has been slow of recasting the present grant so as to make the conditions under which the Community Traction Company operates in that city more nearly tenable. The committee that has been drafting the new plan has reported its findings and the matter now goes before the City Council. It is not possible to go into the details of all the changes proposed. They are still too intangible for that. Some of them, however, are made plain in the tenor of the recent accounts of the negotiations.

These negotiations have been followed closely in the ELECTRIC RAILWAY JOURNAL, as has also the matter of the survey of the properties there, but the gravity of the situation in Toledo is perhaps reflected most poignantly by the figures contained in the report of the company for the year ended Dec. 31, 1926. They show that net income from operation in 1926 was $694,344, compared with $838,210 the previous year, and that the net deficit in 1926 was $253,952, compared with $107,090 in 1925. In explaining how the company can continue to operate on a losing basis, acting Street Railway Commissioner Graumlich said that the sinking fund credit should be taken into consideration as offsetting in a measure the deficits accumulated in the stabilizing fund. That loss as reflected in the stabilizing fund was $910,544 at the close of 1926. It covers the entire six years of service-at-cost operation under the so-called

Digitized by Google

Milner ordinance. However, during this period the sinking fund accounted for retirement of $1,406,000 of the bonds with some additional cash balance in the fund.

One of the bones of contention in considering the revision of the franchise ordinance is the matter of these sinking fund payments. It appears that the practice has been followed of keeping alive the bonds drawn for redemption. If the proposed changes in the ordinance are correctly interpreted all this would be changed. The burden that this plan imposes is apparent on its face. Agreement with Mr. Graumlich is inescapable that the results of operation at Toledo under the ordinance are not satisfactory to the car riders, the citizens or the city generally.

The loss in revenue due to competitive bus service and the high operating costs from duplicated car service and power charges which are conceded to be too high, together with the heavy requirements of the sinking fund, have not left money sufficient for the required maintenance and renewal of the company's property even at a maximum rate of fare and with curtailed service. This is reflected not only in the inability of the company to render satisfactory service, but in its interference with the public improvement program. Expressed concretely, independent buses are estimated to cause a loss of about $250,000 in revenue annually to the railway.

It would be idle to attempt to speculate as to what Toledo will do about the matter, but it does need to do something and do it quickly if the company there is to be able to turn to its own advantage the aggressive policies developed by railways in other cities for winning business. The talent for management which is available on the Toledo properties has been stifled in its efforts through no fault of its own.

Bus Franchises Must Be Secured in Louisville

THERE may or may not be more moves in connection with plans to operate buses in competition with the lines of the Louisville Railway, but such prospective operators will be required to secure proper franchises from the city. This was made plain by a decision of the Court of Appeals, which on June 24 ruled that buses cannot operate there without a franchise. The matter has been pending for months. The decision by the court along the lines indicated will put the railway and any impending competitors on a parity. While the case was under way an injunction preventing the operation of buses by the Louisville Transit Company was permitted to stand. The court ruled that the case did not involve interurban carriers.

Since the Louisville Railway has operated buses in the past it is reasonable to suppose that the company will be willing to supply additional bus service provided only that there is assurance of traffic sufficient to make the lines self-supporting. There can be no question about the reasonableness of an exaction of this kind. Any other procedure would be fallacious. An independent company might be induced to start service, but one or more of several things would happen if operation at the fare fixed originally did not prove profitable. In that event service might deteriorate, fares be increased to a point where there would be a profit or the lines go out of business. Creditors are not disposed to sit idly by and see an enterprise in which they have a stake going from bad to worse. Confronted with a predicament of this kind, they may be loath to act, but when they do act the result of their doing so is spelled in terms of receivership and foreclosure, things that are not pleasant to contemplate.

In the absence of the full text of the decision, the officers of the railway have rightly refrained from comment. It is not too much to say, however, that if the extracts of the finding that are available for publication are exact, the full measure of protection for the railway has been expended to which it is entitled. A condition is untenable in which fish is made of one and flesh of another. That is just what appears to have been done in Louisville under the condition that prompted the bus company to start service merely on the strength of its willingness to pay local vehicle and other taxes. With this the court agreed.

Forbear and Bear With the Exhibit Committee

SPACE assignments for the Cleveland convention were made last week by the exhibit committee of the American Electric Railway Association after an active campaign. This has resulted in the assignment of space to 226 exhibitors representing a call for 108,272 net square feet. With nearly three months to go, this figure represents almost double the square feet assigned at the first exhibit convention in 1916.

The preliminary campaign to make exhibitors understand the need for early space application has been conducted with military precision and that ability for leadership so characteristic of the chairman of the exhibit committee, Col. Joseph H. Alexander, president of the Cleveland Railway. Co-ordination between leader and men was so perfect that at the "zero" hour things went over the top and one of the set objectives of the committee was reached. The main objective, however, in making ready for the display is yet to be obtained, and in so doing the committee still has its problems.

The great growth of this feature of the association's work brings strongly to the fore two points that everyone in the field should bear in mind if the exhibits are to function at their best: First, we have the matter of disappointments that are usually occasioned when the committee struggles manfully to assign one space to perhaps a dozen applicants who have expressed preference for it. The committee at its last meeting made assignments to all members who had applied. In so doing it is anticipated that there will be disappointments and perhaps misunderstandings. No great work that is worth while is free from these preliminaries and it is the JOURNAL's thought that forbearance and co-operation in this respect will result in the end in everybody being happy and a bigger and finer exhibit than has ever been produced in the history of the association.

The second point that it is well to emphasize centers in the fact that the A.E.R.A. statistics show that attendance increases enormously when an exhibit becomes a part of the annual gathering. It is therefore good business and in the interests of the industry as a whole that those who hesitate to exhibit should be given this convincing proof of their error. It is a rare occasion that presents to the manufacturer such a concentration of buyers within a limited space for a specific period. This is the crux of any well-managed exhibit and it should be the clinching argument to those who have as yet not signed the application blank.

Thus the JOURNAL urges the industry, confronted with these points, to forbear and bear respectively with the committee, that success may crown its splendid work.

MILAN Improves Local Transportation

City recently has changed from left-hand to right-hand operation, rerouted its cars, shortened stop spacing and increased scheduled speed. Modernization of rolling stock is under consideration

By Henry W. Blake
Senior Editor "Electric Railway Journal"

RAPID increase in the population of the city of Milan, in northern Italy, and failure to expand and improve the transportation facilities resulted some time ago in the creation of a condition of intolerable traffic congestion. To solve the problem thus created the Mayor selected Comm. Ing. Gaetano D'Alò, an eminent traffic expert. After thorough investigation of the situation, plans were worked out to relieve the congestion. Already the most important features have been put into effect, although some steps remain to be taken.

Milan reminds the visitor of an American city more than do any of the municipalities farther south. In the first place, it is an industrial center. It is said that 40 per cent of the industrial development of Italy is in Milan and vicinity. These industries include seven or eight large car-building plants. The city is also an important financial and mercantile center, being a logical distributing point for the upper part of Italy. Although only a few miles from the Alps, Milan is located on a broad plain watered by the river Po and its tributaries. While its streets are narrow in some portions of the city, in general they are broader, straighter and more level than those in either Rome or Naples. The population of Milan is 910,000, and with immediately adjoining villages and towns it is well above 1,000,000 inhabitants.

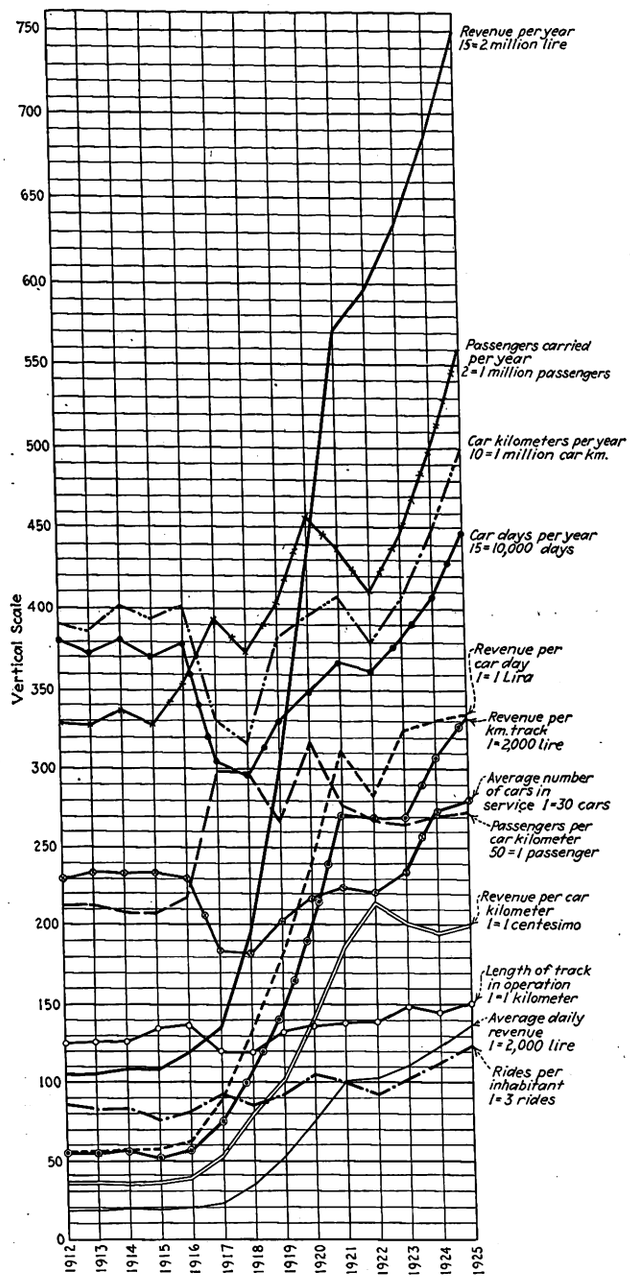
Until ten years ago the electric railway system was operated by the Milan Edison Company, the pioneer central electric lighting company in Europe. Operation was under a franchise according to which the city owned and maintained the track, while the cars were owned and operated by the company. Receipts were divided according to a predetermined ratio. Since Jan. 1, 1917, when the city took over the property, the railway has been a department of the municipal government.

Under the old conditions the heart of the city, the Piazza del Duomo, famous for its historic cathedral, was the place of greatest congestion. From that square car lines radiated in all directions toward the outskirts of the big city. Operation of large numbers of cars on the multiple loops created a veritable whirlpool. This, together with the other traffic, caused serious congestion, the effects of which manifested themselves frequently

Digitized by Google

in delays and service interruptions all over the system.

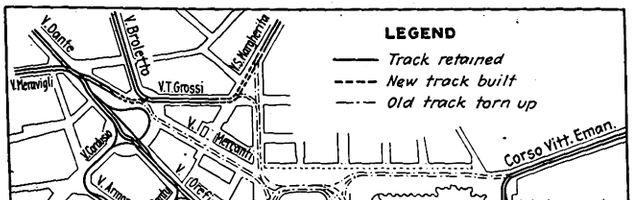
Concentration of trolley lines on the Piazza del Duomo and on the Circonvallazione loop, while satisfying the urban traffic needs of the past decades, became unsatisfactory with the recent expansion of the outlying districts of the city and the incorporation of neighboring communities in the urban area. Building of a subway was at one time considered as the ideal solution of the



Milan Tramways statistics for fourteen years

problem, with underground passages for pedestrians at the approaches to the Piazza del Duomo and the substitution of buses for street cars in the central district.

Aside from the uncertainty as to the adequacy and suitability of bus lines as the sole means of carrying the large volume of traffic during rush hours, it was apparent that such a program was not capable of immediate execution. Besides the organization of a complete bus service, it would have entailed considerable tearing down of buildings at the outer edge of the central district to provide for the installation of loop trolley terminals. Careful consideration was given by the authorities to



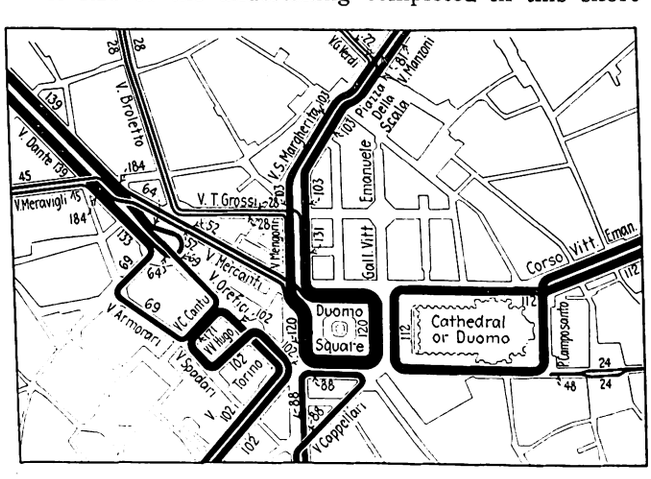
Track changes recently made in central business district to permit through routing of tramway lines

traffic studies in numerous American cities, as outlined from time to time in ELECTRIC RAILWAY JOURNAL.

Mr. D'Alò, realizing the urgent necessity for relieving the intolerable situation existing at the Piazza del Duomo, made this problem the primary object of a careful and comprehensive study. In September of last year he presented his reorganization project to the Mayor, who, in turn, submitted it immediately to the President of the Council. Approval was promptly secured. It was decided to abandon loop operation around the Piazza del Duomo for the more modern plan of through routing. One of the accompanying maps shows clearly the congested condition before the change was made. A second shows the track retained, the new track built and the old track to be torn up in making this change.

At the beginning of October the shops made the first deliveries of materials and on the fourth of that month the first stroke of the pick rang out in Via Capellari. From that day on the work was carried forward by day and night shifts, continuing uninterruptedly in spite of ten days of rainy weather until the connecting lines between Via Carlo Alberto and Via Capellari, Tomaso Grosso and Via Dante, Via Orefice and Via Victor Ugo, Corso Italia and Via Col di Lana and Largo Cairoli were completed, including the complete relaying of the track in Via Dante from Via Meravigli to Via Cardusio on the one hand and from Via Meravigli to Via Broletto on the other. Two months of intensive work sufficed for the execution of the plan, and the Piazza del Duomo was freed from trolley car congestion as though by magic.

The size of the undertaking completed in this short



Flow diagram showing severe congestion formerly existing in the center of Milan

Digitized by Google

period under unfavorable weather conditions is shown by the following statistics:

Time of track hands, man-hours	16,512
Time of track layers and track foremen, man-hours	1,333
Automatic switches installed	7
Built up switch points, pairs	20
Built up crossings and special work, layouts	75
Curved rail, 100-ft. radius, lengths	122
Weight of rails installed, kilograms	14,770
Weight of accessories installed, kilograms	7,610
Weight of track accessories removed and transported to store yard, kilograms	11,490
Cost of labor, lire	85,244.80
Cost of material, lire	509,758.40

At the same time the Porta Romana line was extended from Viale Brenta to Via Basilicata, adding to the system 1,109 m. of track. This extension was necessary in order to enable the trains of the Loreto line to proceed as far as Viale Basilicata and to eliminate the waste of time in attaching and detaching the trailers on the return trip. On Nov. 27, 64 days after the approval of the project, all the essential trackwork was completed and on Nov. 29 not a single car was operating around the Piazza del Duomo.

As a result, the service has been greatly improved. Formerly about 6½ minutes was required by a car to pass around the Duomo loop. In car-kilometers, it is estimated that of the 50,221,000 operated on the entire system in 1925 about 1,000,000 were spent in traversing these loops. Hence, their abandonment meant that amount of clear gain. In car-hours the saving in operation was even greater.

Change Made to Right-Hand Operation

At the same time a change was made from left to right-hand operation. While the general rule of the road in Italy outside the towns is for vehicles to keep to the right, the steam railroads have left-hand operation, and consequently in many cities left-hand operation for both electric cars and other vehicles has been in vogue. The change to right-hand operation, which was brought about by a government order abolishing left-hand operation on highways everywhere, necessarily meant extended changes in the track at crossovers and other points, but was carried through without serious difficulty. No great change had to be made in the newer cars themselves, for reasons mentioned later.

Several other improvements recently have been made in the service. A school of instruction was opened for teaching motormen how to secure a rapid but smooth acceleration and retardation by proper manipulation of the controller and braking equipment. Heretofore, all instruction had been from a safety standpoint only. The time of car stops was shortened by introducing a system of passenger circulation within the cars. By signs, passengers were instructed always to board the cars by the rear platform, move forward after boarding and leave the car by the front platform. Conductors were instructed to urge passengers to follow these rules. By an intensive campaign of education, in which the public was told that these steps were in the interest of better service, remarkable results were obtained. The design of the cars, though old, helped in this campaign.

At present there are about 600 of the older type motor cars in Milan, an inheritance from earlier days. They are short, and each usually hauls a trailer of the same length. Most of these motor cars were built when the "accelerator" type of door was popular, and they are equipped with this type of door on both platforms. As originally used for left-hand operation, the door on the rear platform was close to the curb and that on the front platform away from the curb. When used, as now, for right-hand operation, the rear platform is of course on the side away from the curb and the front platform door near the curb. This gives an easy exit

Track reconstruction incident to the rerouting

from the front platform, as well as a fairly good reservoir space on the rear platform.

The Milan Tramways is planning gradually to replace these cars, or the greater part of them, with more modern rolling stock, but in the meantime, considering their age, they are not as badly adapted to a rapid passenger interchange as might be expected.

Incidentally, it might be added that all the electric railway cars in Milan are painted white. This makes the car a very conspicuous object on the street. White is an especially desirable color at night because an approaching car may be seen at a considerable distance. This enables passengers to stand near a boarding point and so reduces the time of passenger interchange.

Car design in Milan, as well as elsewhere in Italy, is greatly hampered by the over-all limitation to width imposed by the short distance between tracks necessary

Digitized by Google

Material yard of the Milan Tramways filled with ties, rail, etc., to be used in extensive track reconstruction program

because of the narrow streets. The present cars in Milan are about 2.16 m. (6 ft. 11 in.) in over-all width. In the new cars which the tramways contemplates having built it is thought that this width can be increased slightly, to about 2.3 m. (7 ft. 6½ in.), provided there is spreading of tracks which are now very close.

It is also hoped to reduce the height of the car floor by the use of smaller wheels. Most cars in Italy use an 838-mm. (33-in.) wheel because of large diameter motors, and these in turn have been thought necessary because part of the axle width between wheel hubs must be given up to the eccentric of the axle-driven air compressor. With motor compressors and small-diameter motors there would be no difficulty in bringing down the car floor to American standards. Ing. Giovanni Cuccoli, engineer of rolling stock, is now engaged in working out the plans for new cars. Tests are now being carried out to determine the possibility of pay-as-you enter or other system of fixed point fare collection in an effort to speed up car operation; cars are being operated in experimental service with manually controlled doors and steps, and an experiment is being now carried out with pneumatic door and step operation in two-car trains. This will affect materially the design of new cars, which in every case will be based on all-steel, low-wheel, double-truck construction of strictly American type.

Two methods recently adopted by the management for increasing the schedule speed of the cars without increasing their maximum speed have been mentioned. These are rerouting to avoid congested points and the reduction of boarding and alighting time by improved car design. A third method is by systematic efforts to reduce street congestion. While the number of private automobiles in Milan in proportion to the population is much below that of an American city, it probably is higher than any other Italian city, and the problem of street congestion is already a considerable one in Milan. One step being taken to reduce it is a limitation on parking in the business districts. Another is the prevention of cruising by taxicabs. To accomplish this, the law requires each taxicab driver to return to his assigned station after the completion of a trip, although it permits him to take up a passenger and make another trip, provided he obtains a passenger while returning to his station by a direct road. The law also requires him to keep a trip sheet, on which he must enter every pay trip made as soon as completed, and he must file a copy of this trip sheet every evening with the management of his taxicab company, so it can be checked by the police. The police are also empowered to stop at any time any taxi which they suspect of cruising and ask the driver to show them his trip sheet. Finally, all local transportation in the city, including taxicabs, has been placed by the city authorities under the general direction of a manager of local transportation, who is, *ex officio*, also the manager of the local electric railway system. All this helps toward systematic co-ordination of local transit.

Car Stops Reduced

A fourth method of speeding up the movement of cars in Milan has been by reducing the number of stops. As in other European cities, the car stops are clearly marked by signs, which in Milan are of metal, usually hung in the middle of the street from a span wire. A sign reading Fermata Obbligatoria means an obligatory stop; i.e., a stop at a crossing with another track or at some other point where the car will stop for traffic reasons, whether or not passengers wish to board or leave. A sign reading Fermata Facoltativa means an optional stop; i.e., the car will stop to receive or discharge passengers, but not otherwise.

The number of stops of both kinds within the city limits of Milan now averages about eight to the mile. This is higher than in some other Italian cities, and a study is being made to determine whether this number can be reduced. The present schedule speed of the cars is about 11 km. (8½ miles) per hour.

Two main line and one siding track showing curve construction on the Virginian Railway between Roanoke, Va., and Mullens, W. Va.

Catenary Overhead of the Virginian Railway

By B. M. Pickens

General Engineer
Westinghouse Electric & Manufacturing Company

CATENARY construction is used throughout for the suspension of the overhead contact line of the Virginian Railway. The system over each main-line track consists of a mixed strand, copper and bronze messenger supporting through rigid bronze hangers either one or two hard-drawn grooved copper auxiliary wires and a single No. 000, 65 per cent conductivity bronze contact wire. The contact wire and auxiliary wires are clipped together with pressed Phono-Electric bronze clips at intervals of 15 ft. on tangent and the hangers from the messenger to the auxiliary wire are spaced 30 ft. apart. Each clip is spaced 7½ ft. from the adjacent hanger. On curves the lower hanger clip grips both the contact wire and the auxiliary wire or wires and the hangers are spaced 15 ft. apart. The messenger, auxiliary wire or wires, contact wire and hangers are entirely non-ferrous.

The messenger over each track of the main line between Elmore substation and Clark's Gap substation, which constitutes the ruling grade, is composed of nineteen strands, of which a core of seven are extra high strength bronze and the twelve surrounding wires are hard-drawn copper. The diameter of this messenger is 0.725 in.; it has an ultimate strength of 25,000 lb. and an equivalent conductivity of 270,000 circ.mil copper. Two No. 000 or two No. 00 grooved copper auxiliary wires are used on this section of the main line. The messenger, two No. 000 auxiliary wires and the contact wire give a total equivalent conductivity of approximately 714,000 circ.mil copper.

Between Clark's Gap and Princeton a similar type of messenger is used except that it is smaller. It is 0.555 in. in diameter, has an ultimate strength of 15,000 lb., and an equivalent conductivity of 159,000 circ.mil copper. With this messenger a single No. 00 copper auxiliary wire is used, which, with the messenger and contact wire, give an equivalent conductivity of 400,000 circ.mil per track. Additional conductivity is contained in the feeder or balance wire which is required by the three-wire distribution system employed. There is one feeder or balance wire per track of main line. Between Elmore and Clark's Gap the size is No. 0000 and from Clark's Gap to Princeton it is No. 00.

The present normal height of contact wire is 24 ft. 6 in. above the top of rail.

The normal sag of either messenger is 5 ft. in 300 ft. The normal tension of the No. 000 bronze contact wire is 3,000 lb., of each No. 000 auxiliary wire it is 1,200 lb.,

Typical views of the overhead on the Virginian Railway electrification

At left, tangent type support near transition to curve showing inclined bracket arm and steady arm.

In center, two-track curve support on heavy grade section. One single-phase, 88,000-volt, 25-cycle circuit on each pole.

At right, linemen attaching hangers to messenger. Also showing special hanger used in strengthening the contact and auxiliary wires.

and of the No. 00 auxiliary wire it is 1,000 lb.

Inclined catenary, similar to that used on the Pennsylvania Railroad and the Norfolk & Western Railway, with pull-offs at the supporting and intermediate poles, is used on all main-line curves, except on those having large radii, where the pull-offs are omitted.

The catenary system in the yards consists of a single ⅜-in. diameter high-strength bronze messenger, supporting through rigid hangers spaced 20 ft. apart a No. 000 bronze contact wire. The breaking strength of the messenger is 10,000 lb. Chord type construction with pull-offs is used on curves.

Maximum span lengths of 320 ft. are used on both tangent and curve. Where the 88,000-volt transmission line is carried on the poles that support the contact system, long spans are used where possible to reduce the insulation costs. With long spans one or two pull-off poles are placed between the main supporting structures on some curves. On those sections of route having no transmission line on the supporting poles, shorter curve spans and fewer pull-off poles are used. The length of span and number of pull-off poles is determined by the radius of the curve.

The overhead system is insulated for 11,000 volts. If in the future it is decided to change to 22,000 volts, a single suspension insulator unit will be added to each.

Cross spans with back-guyed H-section supporting poles are used as supports for the catenary system for two or more tracks. The single-track catenary is supported from bracket arms attached to H-section poles, back-guyed on curves, but not on tangent. An 88,000-volt,

TABLE I—TYPES OF CATENARY SUSPENSION USED ON THE VIRGINIAN ELECTRIFICATION

Type	Track	Poles	Guys	Pull-offs	Cross Catenary	Cross-Body Strand

Digitized by Google

two-circuit, single-phase transmission line is carried on the main supporting poles of the catenary system between Matoaka tunnel and Elmore substation except for 4.3 miles west of Clark's Gap. One circuit is carried on each pole of the cross span.

The supporting poles are all of rolled steel or an equivalent French H-section. They are regularly set 10 ft. 6 in. and 12 ft. from the center line of the track. The minimum distance permitted on the main line is 10 ft. 6 in., but some poles are set 12 ft. or more to clear the gutter along the track through cuts.

The single-track tangent pole is a 12-in., 65.5-lb. section, without guy. To it is attached an angle section bracket arm with tension rod, which supports the catenary system through a string of three suspension insulators equipped with suitable hardware, a short angle-iron bracket arm for supporting the balance wire, also insulated by three suspension insulator units, and a steady arm rigidly attached.

The bracket arm for supporting the catenary system is of unusual design. Instead of being horizontal it slopes up from the attachment to the pole. The tension rod which is fastened to its outer end and to the pole is in a horizontal position. With this arrangement, the messenger is attached to the lower end of the insulator string at a point about on a level with the point at which the bracket arm is attached to the pole. Thus it is possible to use a shorter pole than could be used with a horizontal bracket arm.

The steady arm is made up of a horizontal pillar type insulator fastened rigidly to the pole. To it is flexibly attached a galvanized pipe having fitted into its outer end a rod equipped with a clamp for gripping the auxiliary wire just above the contact wire. The rod may be moved in or out of the pipe to give the right length to the steady arm.

Specifications for the poles and wires of the various types of construction are given in Table I. Two sizes of poles are used on the single-track curves, depending on the degree, as indicated in Types 2 and 3. Types 4 and 5 are the double-track cross catenary for tangent track, while Types 6 and 7 are for higher degree curves. On the heavy grade section west of Clark's Gap, where there is no transmission line on the poles, Type 8 is used for the tangents and Type 9 for low curves. Type 10 is used for the sharper curves in this region.

The two-track tangent cross-catenary supports for two main line tracks with a single-circuit, single-phase, 88,000-volt transmission line on each pole is made in the form of Type 11 on tangents and Type 12 on low-degree curves. Where there are two main line tracks and two single-phase transmission lines Type 13 is substituted. Three-track cross-catenary supports are indicated in Type 14 for tangent track and Type 15 for curves. In this construction all pull-off poles excepting those on bridges and some in the yards are back-guyed.

The yard cross-span supporting poles are 8-in., 12-in., or 14-in., or equivalent H section, back guyed. Steel strand cross catenaries are attached to U-bolts or eye nuts in the poles by sockets. A cross steady span is run from pole to pole just below the cross catenary, and the insulators for each messenger are attached to it and supported from the cross catenary by droppers, straps near the center of the cross catenary where the distance is short and strand near the poles. A second steady strand is located just above the contact wires and it is attached to them by short, steady arms.

Concrete protecting sleeves are cast around the lower

Digitized by Google

ends of all poles. This work was done in a yard at Roanoke. From this yard the poles were shipped out to where they were to be used and set with a crane in holes previously prepared for them. To prevent earth holes from caving in, and to give a straight-sided pole in rock instead of the cup-shaped one caused by blasting, corrugated sheet iron culvert pipe was set in the holes as they were dug and earth and rock were filled in around the pipe. Coarse rock was used for filling in around the pole and it effectively locked the pipe to the concrete sleeve.

Anchor blocks for the guys were also made up in the yard at Roanoke and shipped out to be placed, by a crane on the work train, into holes prepared for them.

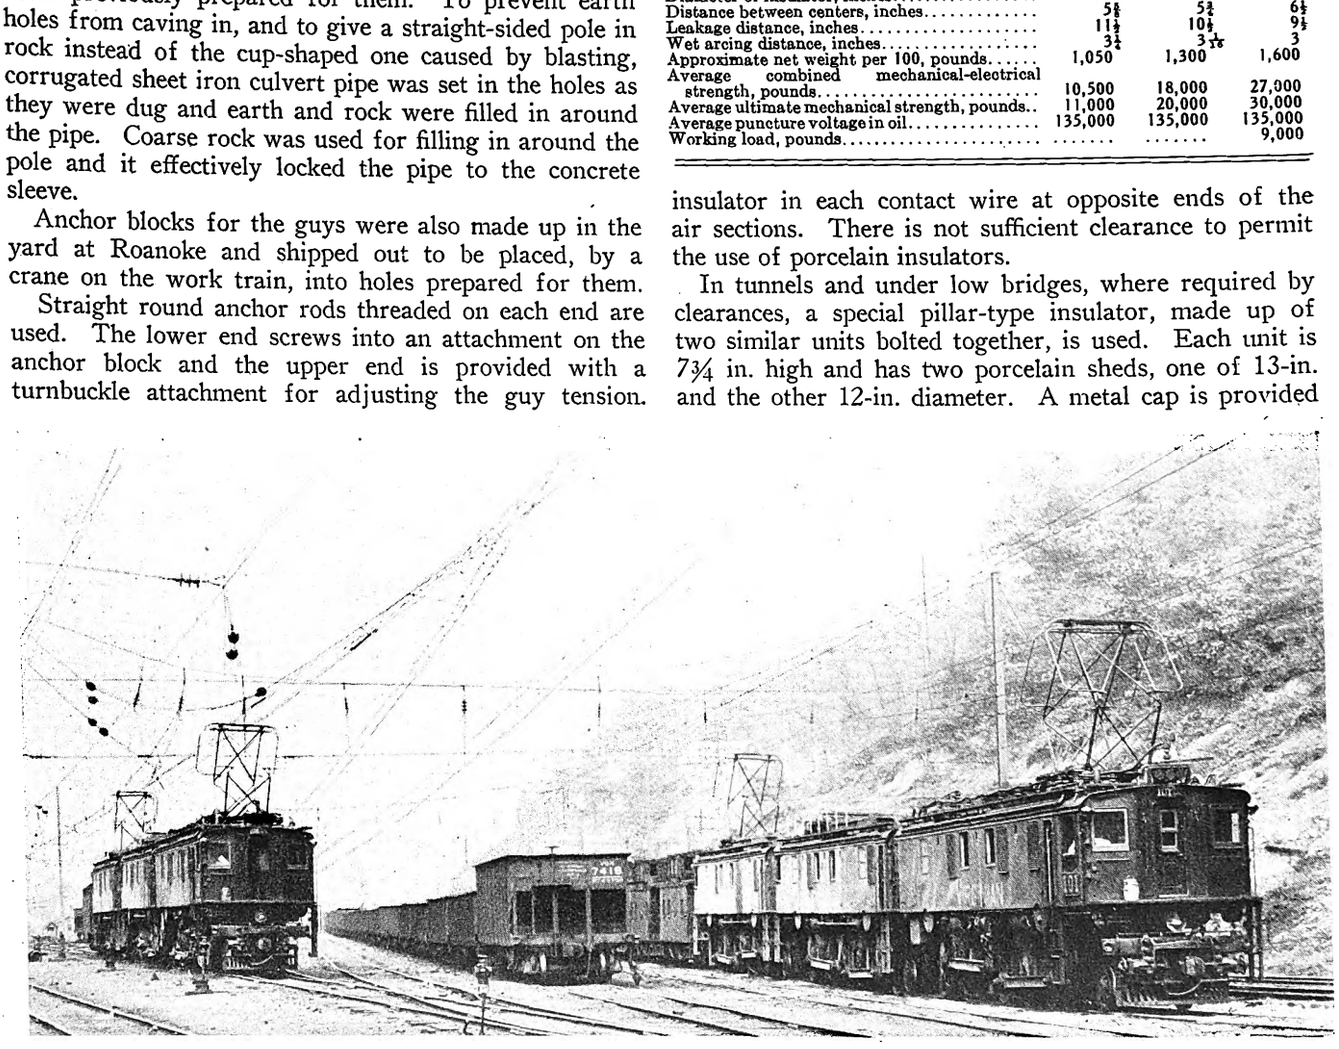
Straight round anchor rods threaded on each end are used. The lower end screws into an attachment on the anchor block and the upper end is provided with a turnbuckle attachment for adjusting the guy tension.

TABLE II—PROPERTIES OF SUSPENSION INSULATORS

Insulator number	601	631	633
Trade voltage rating	20,000	20,000	20,000
Dry arc-over voltage	80,000	80,000	75,000
Wet arc-over voltage	46,000	45,000	40,000
Diameter of insulator, inches	10	10	10
Distance between centers, inches	5⅝	5⅞	6½
Leakage distance, inches	11½	10½	9½
Wet arcing distance, inches	3¼	3 1/16	3
Approximate net weight per 100, pounds	1,050	1,300	1,600
Average combined mechanical-electrical strength, pounds	10,500	18,000	27,000
Average ultimate mechanical strength, pounds	11,000	20,000	30,000
Average puncture voltage in oil	135,000	135,000	135,000
Working load, pounds	.....	.....	9,000

insulator in each contact wire at opposite ends of the air sections. There is not sufficient clearance to permit the use of porcelain insulators.

In tunnels and under low bridges, where required by clearances, a special pillar-type insulator, made up of two similar units bolted together, is used. Each unit is 7¾ in. high and has two porcelain sheds, one of 13-in. and the other 12-in. diameter. A metal cap is provided



Special overhead construction on in yard at Elmore

A socket on the guy end attaches to the eye of the turnbuckle. In rock the rod is grouted into drilled holes and in some instances the lower end is split and a wedge inserted which is forced into the split when the rod is driven into the hole.

Forged steel sockets are used on the ends of guys for attaching to the poles or anchor rods. These sockets were poured with spelter at the shop in Princeton, where the work could be supervised and controlled.

The contact system and balance wires are insulated by suspension insulators, three and four units to a string. Westinghouse No. 601 insulators are used at suspension points and in pull-offs. No. 631 insulators are used in dead-ending contact and auxiliary wires. The extra high strength insulator, No. 633, is used for dead ending and sectioning the messenger. It is strong enough so that not more than one string of insulators was needed for dead ending any strand. The properties of these insulators are given in Table II.

Air sections are used in cross-overs, at substations and in the yards for sectionalizing. The contact wires are run by each other and each wire is attached to the auxiliary wire above the other contact wire. They are held apart and are alternately lifted one above the other to permit the insertion of a 6-ft. impregnated wood stick with four holes for bolting to the roof of the tunnel, and two special castings hold the messenger directly against the insulator base. Four bronze bolts hold the insulator against the tunnel roof and they are held by expansion anchors into holes drilled in the roof.

In tangent tunnels with sufficient clearance three suspension units held up by a single bolt in the roof support the messenger. The contact wire is normally 19 ft. above the rail. On curves in two-track tunnels suspension insulators support the catenary over the track on the inside of the curve and the special insulators are used for the track on the outside of the curve. The catenary on sharp curves (some are 12 deg.) in tunnels is special. That on the heavy grade section, where two auxiliary wires are used, has the second or upper auxiliary wire raised about 6 in. above the contact and other auxiliary. The two are held apart by short hangers. The upper auxiliary wire is separately attached to the messenger by its own hangers. Thus a triangle is formed, with the contact and one auxiliary wire at the lower corners. The short hangers between these two wires and the other auxiliary wire form the short side of the triangle and the other two sides are formed by the two sets of hangers from the messenger. With this pull-offs are not needed even on the 12-deg. curves.

Digitized by Google

The contact wire splicer is of unusual design, being made up of four pieces of sherardized steel held together by six machine bolts. The splicer, which is 10 in. long, does not encircle the wire, but only grips above the groove. The ends of the two wires to be joined are put into a die and a cutter is forced through, the die cutting a series of notches in the back of the wire varying from nearly as deep as the groove near the end of the wire to very slight near the end of the splicer. The chuck jaws of the splicer have teeth to fit into these notches. The two sides of the splicer fit into the groove in the wire and hold the chucks into the notches. A Cleveland-type chuck splicer is used for the auxiliary wires.

Tangent hangers are made up of a ¼-in. Phono-Electric rod with each end bent into a half ring, having at the upper end a cast bronze clip which grips the messenger, and at the lower end a pressed clip for attaching to the auxiliary wire, or in the yards to the contact wire. The clips are adjustable to allow for the varying slope of the messenger with respect to the contact wire.

The curve hangers have ⅜-in. Phono-Electric rods with a clip similar to that used on tangent for the messenger, but the lower end is upset and threaded. It passes through the two halves of the clip between the contact and auxiliary wire and holds them together.

Deflectors at cross-overs and turnouts were built up from curve and tangent hanger parts and from special spreader rods, each rod having upset threaded ends similar to those on the lower ends of the curve hangers. The hangers were cut to fit in the field and the half ring put on the end of the rod with a special tool.

Pull-off yokes are made from galvanized steel strap 2¼ in. x ¼ in., 4 ft. 3 in. long. One end is punched for attaching the pull-off strand and the other bent to almost a right angle and provided with a hole for bolting on the contact wire clip. The yokes are usually used in pairs.

The hanger rods were received at Princeton in bundles of half span lengths marked with tags for the spans in which they were to be used. The bundles were opened in the shop and the clips attached at each end, after which the bundles were put together again and shipped out to the place where they were to be used. The hangers were attached to the messenger by a lineman riding along the messenger on slings. Helpers on the ground measured off the spacing and marked the hanger locations on the rail. The hangers were clipped to the contact and auxiliary wires by crews working from tower cars. Hanger lengths were calculated in advance to fit the curves and spans where they were to be used. For this an accurate survey of the road was needed, giving location and radius of curves and characteristics of the spirals.

One pole of each supporting structure is bonded to the rail. In the tunnels, a copper ground wire is run along the roof of the tunnel and is attached to the cap of the upper insulator of each support.

The two main-line tracks are sectionalized from each other so that they can be operated separately. Princeton yard is sectionalized from the main line and at Elmore yard the two outside tracks are sectionalized from the remaining ten tracks, which are divided into two groups of five each.

The main-line tracks are bonded with two No. 0 detachable pin-terminal, single-strand bonds per joint. These are semi-concealed where the splice bar permits and exposed where they cannot be placed behind the splice.

The entire electrification includes 134 route-miles of track from Mullens, W. Va., to Roanoke, Va. Of this, approximately 36 miles, from Mullens to Princeton, W. Va., has been in operation since September, 1925, and the remaining 98 miles to Roanoke since September, 1926. On the section from Mullens to Princeton, a distance of 21 miles from Mullens to Matoaka is double track and a distance of 15 miles from Matoaka to Princeton is single track. With the remainder of the electrification included, there are more than 200 miles of track under contact wire. Articles on the electrification have appeared in ELECTRIC RAILWAY JOURNAL for Sept. 21, 1925, and several subsequent issues.

New Shop for Cincinnati Street Railway

Eight Departments Housed Under One Roof—Sand-Blasting Room, Car-Washing Room and Oil and Waste Reclaiming Department Are Included

BY E. J. JONAS
Superintendent of Equipment Cincinnati Street Railway, Cincinnati, Ohio

EVEN though plans for the new car repair shop now under construction for the Cincinnati Street Railway are not yet completed, the building for this shop is well under way and should be ready for occupancy about Oct. 1. The stores department, not shown on the accompanying plan, will be located to the right of the shop building and will have an area of about 25,000 sq.ft.

The design of the shops departs from conventional lines, in that the various departments are housed under one roof. Provision is made for the cars to enter the building through doors on either end directly onto the depressed type of transfer table, which is equipped with a car body hoist.

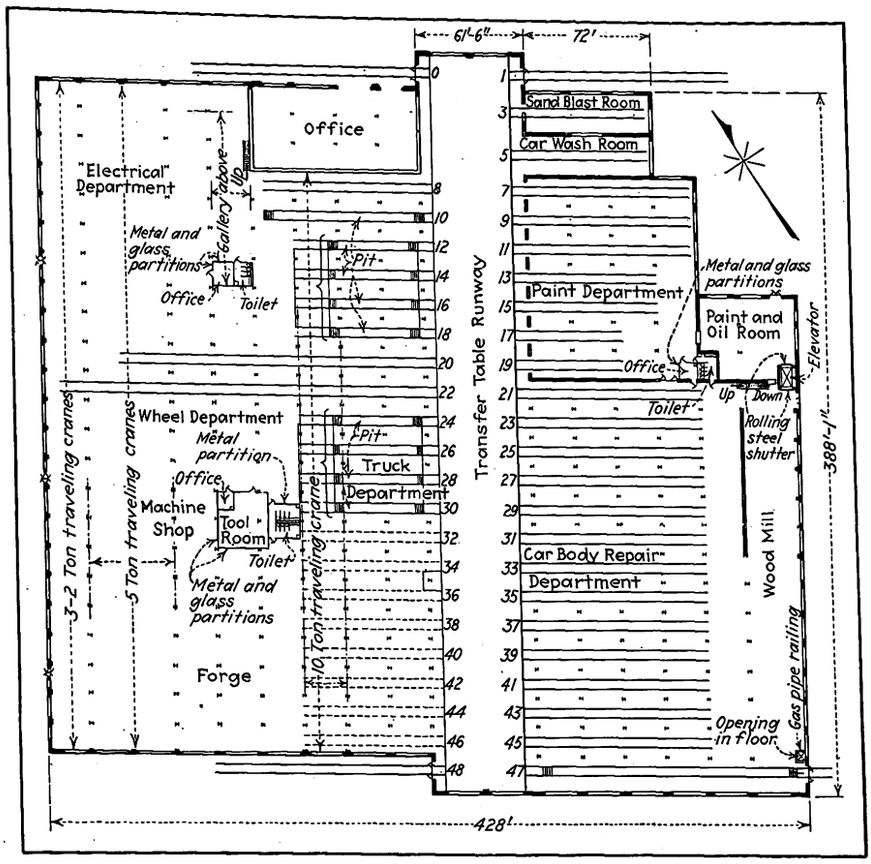
As cars come into the shop for overhauling the bodies will be removed from the trucks on the transfer table and dummy trucks installed. The car body will then be placed in the erecting shop and trucks placed on tracks in the truck department.

The general dimensions of the shop are 428 ft. x 388 ft., with the usual provisions for an electrical department, wheel department, machine shop, forge shop, paint shop, mill room, erecting shop and truck shop. The paint shop is the only department that will be inclosed separately. It will be equipped with an exhaust system to facilitate use of the spray method of applying paint and lacquer. Ample space is allotted each department, not only to provide for the present needs of the property but also to take care of the mechanical department in its natural growth for a period of more than twenty years.

Provision is made for handling 64 cars. About 14,000 sq.ft. of floor surface is allotted to the electrical department, 13,000 sq.ft. to the machine shop, 11,000 sq.ft. to the forge shop, 7,000 sq.ft. to the wheel department and 9,000 sq.ft. to the mill room. The handling of materials and supplies through the various shop departments and into the storage room will be by industrial electric trucks of the elevating platform type.

One of the unusual features is that the tunnel through which the heating ducts are carried for distribution to the shop will be enlarged to accommodate the passage of

Digitized by Google



Preliminary plan of new repair shop of Cincinnati Street Railway

the electric trucks from the storage room basement to the shops. This will expedite the movement of supplies, because the trucks will not be subjected to the usual delays caused by material or workmen passing through the aisles in the shop. Elevators are located at convenient points in the shop to bring the trucks to the shop floor level.

The use of monorails and jib cranes is being limited due to their small working areas. One 5-ton traveling electric crane running the full length of the building and with a 48-ft. span will serve the forge shop, machine shop, wheel department and electrical department. Paralleling this 5-ton crane, a 2-ton crane with a 24-ft. span in the electrical department will handle armatures from the time they are removed from the motor cases until they are again installed, without subjecting them to the chances of mechanical injury encountered when transporting them by means of buggies. A second 2-ton crane will be installed on the same runway over the wheel department for handling wheels to and from the wheel press and wheel lathe. A third 2-ton crane will be installed on this same runway over the machine shop to handle material to and from the lathes which are arranged in this bay. By means of these cranes it will be possible to cover approximately 50 per cent of the floor space in the forge, machine shop, wheel department and electrical department, and all machines that handle heavy work will be located under these cranes.

The floor in the truck shop is depressed 15 in. below the top of the rail, allowing the work to be carried on with the workmen in normal working positions. Four electric car hoists of the overhead type are to be installed in the truck shop and traveling cranes of 2-ton capacity are to be used over the tracks where the truck work is carried on.

Adequate storage facilities are provided throughout the shop in order that equipment may be handled without cluttering up the aisles. A cellar is provided under the wheel department for storing unmounted wheels. Wheels received in carload lots will be unloaded into the cellar outside the building and will be brought up to the shop floor level inside of the building by means of an elevator at the time that they are required. Storage for wheels mounted on axles is provided on tracks just outside the building, which will allow the crane on the supply car to pick up good order wheels and deposit bad order ones without extra handling. A cellar is provided under the mill room to accommodate refuse, ducts, motors operating the mill machinery above and for storage of sweeper brooms and other bulky material. The waste and oil reclaiming plant will be located directly under the paint mixing room. Provision has been made for a sand-blast room, a car-washing room and a reclamation department.

As the greatest distance any track extends from the transfer table is approximately 90 ft., except the two tracks into the wheel department, there will be no 550-volt overhead trolley wires. Cars will be moved to and from the transfer table by means of flexible power cables controlled from the table.

Traffic Expedited by Staggering Positions of Safety Platforms

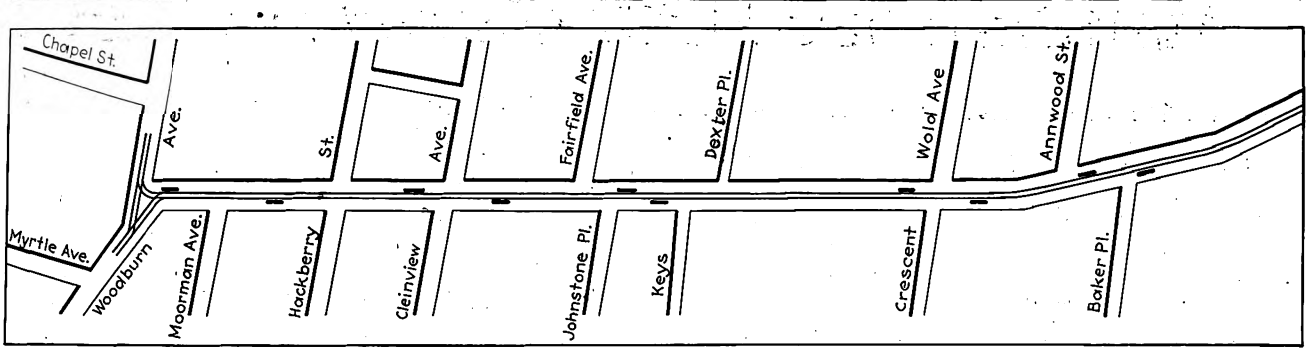
Correct Location with Respect to Each Other and Intersecting Streets Is of Primary Importance in Cincinnati—Platforms Are Never Placed Directly Opposite

By C. O. Sherrill
City Manager, Cincinnati, Ohio

CORRECT location of safety platforms with respect to each other and intersecting streets has an important effect on their usefulness. This phase of the matter was not discussed in the article published in Electric Railway Journal April 9. After considerable experimentation we have adopted in Cincinnati a staggered location with platforms about 50 to 100 ft. apart, far enough to allow motor traffic to use the street on both sides of the platform. This arrangement tremendously expedites traffic by avoiding the bottleneck created where the two platforms are opposite each other by the forcing of all traffic to the right of the platforms.

In the location of the safety platforms it has been found advisable on busy streets with motor traffic moving at 30 to 35 m.p.h. to place them not closer than about 300 ft. apart. Too close spacing in fast traffic tends to throw out of use the part of the street between two adjacent platforms. Another advantage is that it discourages too frequent stops by the street cars.

Digitized by Google



Staggered safety platforms on Madison Road, Cincinnati

Not only are the platforms valuable in streets normally wide enough for their use, but on streets as narrow as 40 ft. they are of great value. There they are installed 4 ft. wide with a 3-ft. cut-back into the sidewalk opposite the platforms to allow motor cars to pass the stopped street cars. In streets of this width without platforms a stream of motor cars sometimes a block long may be seen following a street car and unable to pass when the car is stopped, because of passengers getting off and on. In the congested district, where traffic is controlled by traffic lights, these platforms are particularly valuable because the automobiles can pass freely while the trolley is being loaded. Speeding up of traffic due to the platforms, because of the absence of pedestrians continually walking out in the roadway to board cars and the elimination of the necessity of stopping motor cars to allow passengers to get on and off, far more than compensates for the loss of space due to them.

The value of platforms to the street railway is the great increase in safety to the passengers, the expedition of loading and unloading, the decrease in the number of stops and an increase in the number of car riders. Many requests have been made for the installation of platforms, accompanied by the statement that children cannot use the street cars without them on busy streets on account of the dangers involved. Their value from the city's point of view is equally great in expediting traffic and decreasing the hazard to pedestrians and car riders.

Equipment and design of the platforms in Cincinnati is believed to be ideal in simplicity, economy, attractiveness, visibility and security. The illumination is accomplished by means of the Westinghouse redhead warning beacon with a 50-watt lamp on top in a ruby refractor and a 150-watt lamp below in a white enameled reflector to illuminate the platform and protecting fence. The over-all height of the unit is 8 ft. 6 in., the height to the light center of the 50-watt lamp is approximately 7 ft. and the height to the enameled reflector is approximately 6 ft. 5 in. The platform and other equipment are installed by the city, the railway company paying for current for the illumination. A large reflector is attached to the fence, and it has been found that it gives adequate protection in cases where the lights may be out. It is essential that the reflector be large, and also that it be kept clean in order that the automobile headlight rays will give a strong, clearly seen reflection. A protective fence, constructed around the front end of the platforms, consists of four rails set in the ground 3½ ft., with three steel bands welded horizontally across the front. This gives sufficient strength to insure protection to the pedestrians from all kinds of motor traffic.

With these methods of illumination and the large reflector used there is really no excuse for the platforms being hit by motor cars. The fence and lamp post are painted white, as a further aid to safety and also as an interest to increased attractiveness. The general result is most pleasing and has met with great favor among the people of the city. Safety platforms of this type have replaced large beacon lights mounted on masses of concrete, locally called "battleships," with the complete approval of the public and with almost complete absence of accidents to motor cars and, so far as reported, without any accidents to pedestrians.

Platforms on Madison Road are located in various relations to each other and intersecting streets, but are never directly opposite

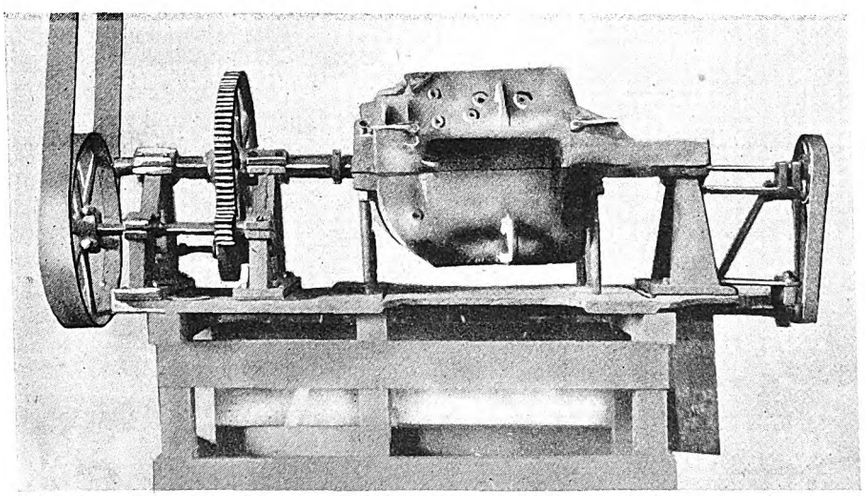
Maintenance Methods *and* Devices

Thorough Overhauling Reduces Defects

By C. W. Wood

Master Mechanic Virginia Public Service Company, Hampton, Va.

IN overhauling car equipment used by the Virginia Public Service Company it is our practice to put equipment in the best shape possible. Cars are shopped on a 75,000-mile schedule. At this time all equipment is removed, trucks and motors are dismantled and all worn truck parts are repaired by welding or are replaced by new parts. Motor and truck parts are cleaned by boiling in Okite cleaner. Brake levers and pins are case hardened. Manganese wear plates are installed wherever permissible in such places as for bolster chaffing plates and pedestal gibs. All loose bolts are replaced with new ones and every precaution is taken to put the trucks in as good condition as when new. After assembly the truck is painted with a good underframe black by the spray method.



Fixture used for reboring housing seat in Westinghouse type 101 B motors. Frames are built up by arc welding and are rebored to take standard housings

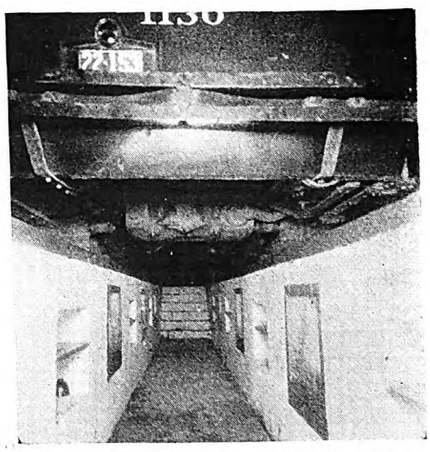
Motors are also dismantled completely. Armatures, brush-holders and field coils are removed, and after testing and the necessary repairs are made the armatures and fields are dipped in baking varnish and baked for 72 hours at about 100 deg. C. All bearings are replaced with new metal. Motors are given a running test on the shop floor before being mounted on the trucks. The current for running the motor on test is supplied by a motor-generator set, which is also used for arc welding. After the equipment is reinstalled the cars are given a running test of several miles before going into regular service. With this thorough method of overhauling we seldom find it necessary to change a piece of equipment other than brake shoes and cars remain out over the entire overhauling period of 75,000 miles. Cars are inspected on a 1,000-mile basis between regular overhauling periods. At this time brake shoes are changed, the equipment is oiled and minor truck repairs are made to keep parts tight and in proper operating condition.

Pit Construction for Bus Overhauling

By Robert M. O'Brien

Superintendent of Rolling Stock and Shops, New Orleans Public Service, Inc., New Orleans, La.

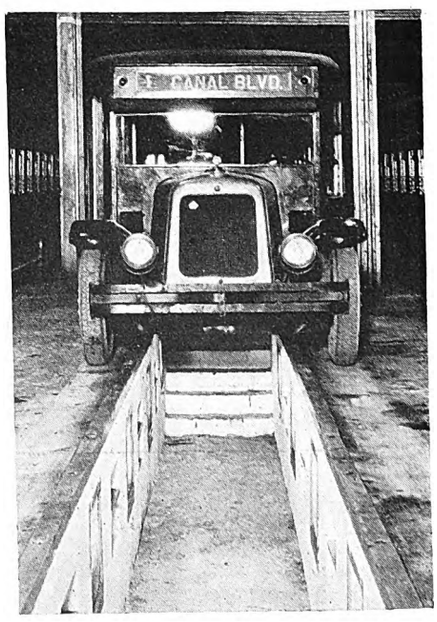
THE pit construction used in our bus garage has some particularly interesting features. The pits are 4 ft. deep, 3 ft. 10 in. wide and 45 ft. long. Steps are constructed at either end in order to assist in entering and leaving. These steps extend lengthwise of the pit 4½ ft. at each end, leaving a total distance of 36 ft. which has a 4-ft. depth. Our longest buses are 30 ft. long, so that with a bus over the pit there is a space of 6 ft. left in which a pit hoist may elevate heavy automotive parts to remove them from the pit.



Light receptacles have an inclined reflector to throw the light upward

Four-inch guard rails are used at either edge of the pit, the width of which is the maximum that can be used, and the dimensions given above apply only to our wide gage buses. Others have to use a narrow gage pit. The depth of 4 ft. has proved most suitable for working conditions. The pit floor is sloped to one end, where a sump is provided which is covered by grating.

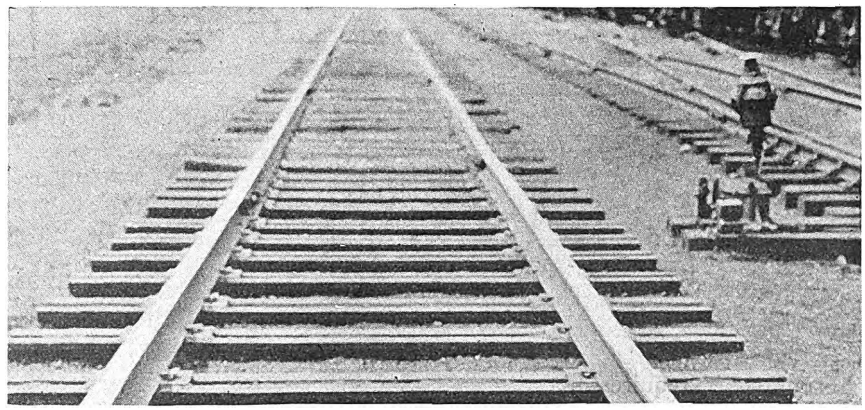
Particular attention has been given to the illumination of the pits. Large pockets are built in the pit walls on 8-ft. centers. The pockets are staggered so that there are five on



General view of pit construction from above

Digitized by Google

one side and four on the other. Projectors with 200-watt lamps and diffusing lenses protected with wire netting throw the light upward to the underside of the bus. The pit lamps are in two circuits so that only half need be lighted. Tool pockets in the pits are staggered opposite the pit lights. Due to the mild climate in which we operate no heating of the pits is required, and as the garage doors can remain open throughout the year no additional ventilation is needed.

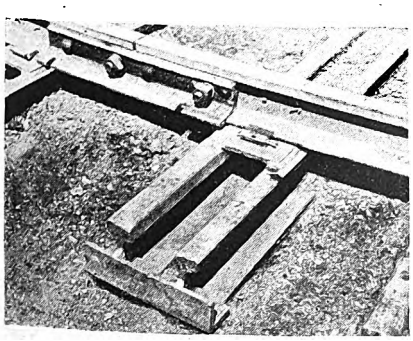


A section of track using the metal ties

Scrap Rails Used for Railroad Ties

METAL railroad ties constructed by arc welding worn rails are being used by the Delaware & Hudson Railroad for yard and siding tracks. The design was developed by H. S. Clarke, engineer maintenance of way for the Delaware & Hudson Railroad, in collaboration with engineers of the General Electric Company.

Two rails are used for each tie. The two lengths are fastened together at each end by metal plates which are welded in position. L-shaped angle bars used with ordinary rail joints can be used for this purpose. When two rails are fastened together movement of the tie in any direction in the ballast is eliminated.



Close-up of one section of track to show details of tie construction

For fastening the track to the tie metal plates are welded to each tie and the track is clamped to these with special clamping devices. As the edges of the tie plates are placed over the center of the top flange of the tie bars the wave action of the rail throws the load directly over the webs of the tie beams instead of on the outer edge of the flanges. This construction reduces the number of rail clamps to a minimum.

The cost of fabricating a metal tie of the type shown is 60 cents and the scrap value of the tie is $2.50, making an over-all cost of $3.10. Inasmuch as the scrap value can be realized out of the rail when it is later discarded from service, the net cost of the metal tie is reduced to the cost of fabrication, or 60 cents. Present applications have been confined to yard and siding service. This requires more than 30,000,000 ties a year for replacements.

EARN—*while others learn*

PRIZES TO BE AWARDED

First—$200 Second—$100 Third—$50

Monthly Prize—$25

FAVORABLE comment has been received from the heads of several maintenance departments on the educational feature of the ELECTRIC RAILWAY JOURNAL'S Maintenance Prize Contest. The fact that certain articles are submitted in the contest draws increased attention to them so that they are read the more widely and studied the more carefully. The result is that the best ideas are being put into practice on many railways. This interest also has the effect of focusing the attention of maintainers on the particular practices that they are using. They analyze their methods and compare them with similar ones published to see if they excel or if they can be improved.

When a railway employer finds that the method or device in use on his property has particular points of excellence he is doing a service to the industry by sending it in for publication so that others can profit by the economies that result. The number of articles submitted is far above that expected by the editors and the ingenuity displayed in some of them is remarkable.

The third installment will be published in the July 16 issue of ELECTRIC RAILWAY JOURNAL. Though they cannot all be published this month, articles should reach the editor not later than July 9 in order to give sufficient time to make cuts and have them available for publication among those that will be judged for the third monthly prize of $25.

The announcement of the winner of each monthly contest will be made in the third issue of the month following the one in which the items are published. Winners of the capital prizes will be announced in the Annual Convention Number, to be published in September, 1927.

Send in your ideas at once!

Here are the rules in brief:

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated prior to Aug. 1, 1927. For the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints, or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given above will be found in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

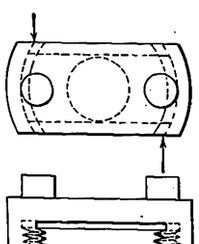
New Equipment Available

Bus Steering Made Easy with New Device

A MECHANISM provided with a control shaft at one end and a work shaft at the other which operates to provide a mechanical torque amplifier is a recent development of the Bethlehem Steel Company. The control shaft requires but a feeble torque to operate it in either direction, while the work shaft yields a torque of sufficient amount to accomplish the desired purpose and at the same time follows accurately the control shaft in all of its angular movements.



Diagrammatic view of lashlock. The principles used in this backlash eliminator may be applied also to take up play in push rods of motor vehicle engines

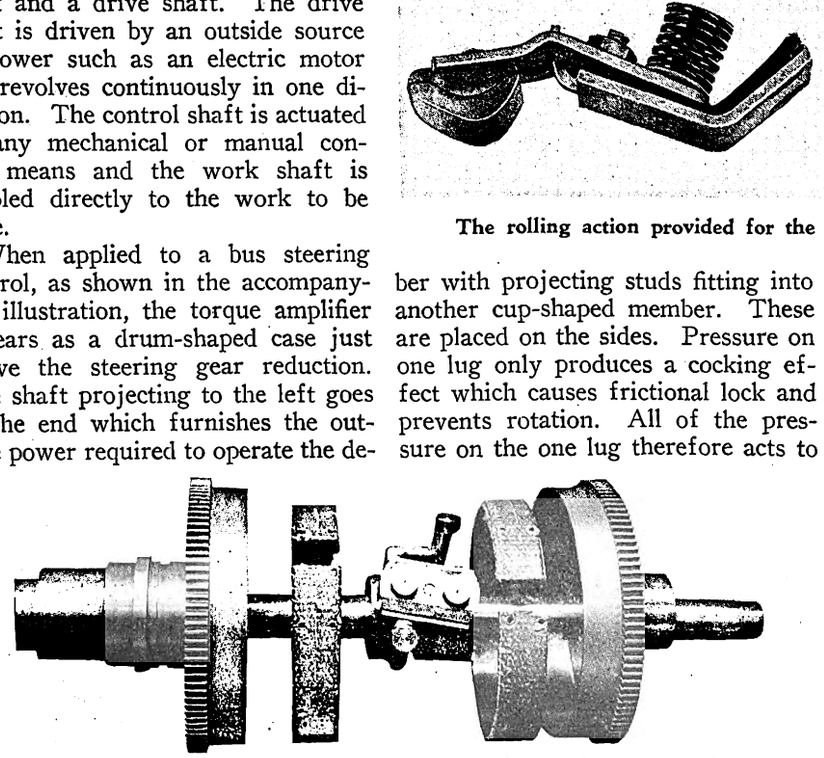
The three elements of the torque amplifier are a work shaft, a control shaft and a drive shaft. The drive shaft is driven by an outside source of power such as an electric motor and revolves continuously in one direction. The control shaft is actuated by any mechanical or manual control means and the work shaft is coupled directly to the work to be done.

When applied to a bus steering control, as shown in the accompanying illustration, the torque amplifier appears as a drum-shaped case just above the steering gear reduction. The shaft projecting to the left goes to the end which furnishes the outside power required to operate the device. In addition to this drive shaft from the engine, a work shaft is coupled directly to the steering gear inside this case and the control shaft is coupled to the main steering post.

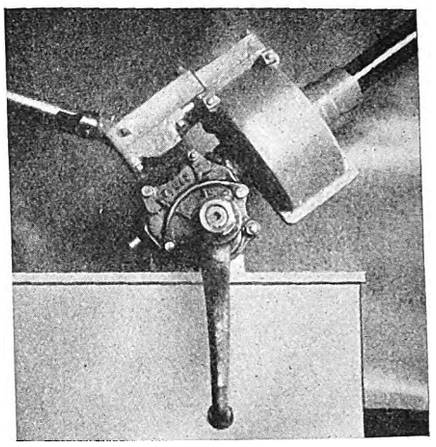
By use of the drums and the friction bands which may be brought into contact with them through the actuation of the control shaft, the steering wheel can be moved freely in either direction with but a small amount of effort. In devices of this sort already constructed the ratio between the torque applied and delivered from control to work shaft ranges from 1 to 10 up to 1 to 50,000.

In the exposed view of this mechanism another device is shown which is known as a "lashlock." It is intended to eliminate backlash automatically and is used to avoid the exceedingly close tolerances and the alterations due to heating and wear in service that would otherwise occur with the torque amplifier alone. It is necessary to have close adjustment, so that in reversing the direction of the control shaft the bands on one side may grip just when the bands on the other side release.

The lashlock consists in principle of a wedge-shaped member with rollers pressing against it from opposite sides. The principle is carried out in the amplifier by a member with projecting studs fitting into another cup-shaped member. These are placed on the sides. Pressure on one lug only produces a cocking effect which causes frictional lock and prevents rotation. All of the pressure on the one lug therefore acts to move the stem in the direction in which the lug delivers the pressure. The effect is the same as when one tries to open a bureau drawer by pulling one handle only. Pressure on both lugs corresponds to pulling the two handles together



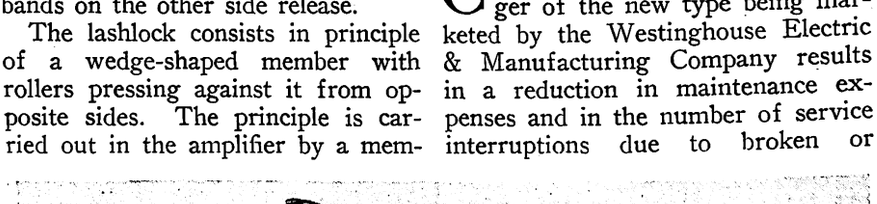
Torque amplifier with housing removed to show friction bands, control arms and lashlock for eliminating backlash



Application of torque amplifier to steering gear. Drums are driven from an engine connection as shown at the left. Steering gear proper is not disturbed

Improved Compensating Fingers

COMPENSATING controller finger of the new type being marketed by the Westinghouse Electric & Manufacturing Company results in a reduction in maintenance expenses and in the number of service interruptions due to broken or burned fingers. The feature of design consists chiefly in a spring movement obtained by the action of a helical steel spring between two steel members, one of which is used for the mounting finger, the other for carrying the contact tip. A rolling action between the two provides for maximum contact at all times.



The rolling action provided for the contact tip insures full width contact

Rugged construction eliminating breakage, self-aligning and maximum contact, reduced finger pressure, increasing the life of the finger, and the elimination of burned fingers, due to the fact that the spring does not carry current, are other improvements contained in this new design of compensating finger.

Association Activities

New York Association Discusses Conservation of Street Space

Program at Annual Meeting Also Covers Equipment Developments, Overhead Construction and New Shop Construction

LEADERSHIP in bringing about more efficient use of existing street facilities was urged upon electric railway men by E. J. McIlraith, speaking before the 45th annual meeting of the New York Electric Railway Association, held at Bluff Point, New York, June, 24, 25, 1927. Other subjects considered during the meeting included recent improvements in car design, presented by F. M. Brinckerhoff, consulting engineer Brooklyn-Manhattan Transit Corporation; trends in overhead construction, by L. W. Birch, engineer Ohio Brass Company, and general design features of the new B.-M.T. Coney-Island shops, by W. G. Gove, superintendent of equipment of that company. Both Mr. Brinckerhoff and Mr. Gove used lantern slides to illustrate their subjects.

Conditions in the electric railway industry were reviewed and interpreted by Managing Director L. S. Storrs of the American Association. "The outstanding development today," he said, "is the improvement in morale of our own people." Actual experience figures show that the larger electric railway properties of the country have decidedly turned the corner and are headed for improvements in service and earnings, according to Mr. Storrs. Although this improvement has not extended so generally to properties in smaller cities, he felt that even there many indications point toward a reversal of the previous trend and an era of increased usefulness and prosperity for transportation companies. One outstanding development to which Mr. Storrs called particular attention is the increased confidence in the future on the part of railway managements generally. Further improvement was also predicted from the tendency on the part of the public to look with more favor on electric railway securities and the consequent reduced resistance and better terms under which some properties have been able to obtain new money.

Abstracts of the paper presented by Messrs. E. J. McIlraith and W. G. Gove are published in this issue. A paper by L. W. Birch on overhead construction will appear in a future issue.

Speaking extemporaneously, to supplement his prepared manuscript, Mr. McIlraith declared that electric railway men have a responsibility regarding street congestion relief which they have so far failed to assume. As transportation men, he held that they are particularly fitted to deal with this problem, which is an acute one even in smaller sized cities. The very baffl complexities of the situation throughout the country, which have defied the efforts of public officials, offer trained transportation men the opportunity for assuming leadership and rendering an outstanding service to both their communities and companies.

Two factors essential to the success of such an effort were emphasized by the speaker. First of these is the need for a thorough study and adequate preparation to deal scientifically with the many elements that affect traffic movement and street capacity. With this as a starting point, Mr. McIlraith laid particular emphasis on the importance of maintaining an absolutely unbiased viewpoint, having in mind always the general community's best interests. Real leadership, he maintained, can be won only through public confidence, which in turn is built on demonstrated sincerity of purpose and ability. Once railway men adequately fit themselves to bring about maximum usefulness of streets for all those who are dependent on them as traffic arteries, and have won public confidence through demonstrated sincerity of purpose, they may readily assume leadership by working through associations of commerce and other business and civic organizations. Mr. McIlraith cited the experience of the Chicago Surface Lines to demonstrate the advisability and soundness of such a program.

Methods followed in Rochester in making a traffic survey and some of the information disclosed were outlined by L. R. Brown, engineer New York State Railways, in discussing Mr. McIlraith's views. This survey was conducted by the traffic committee of the Rochester Engineering Society, using Boy Scouts for the collection of data. Some of the recommendations made by this committee were listed. One of these was the complete elimination of parking in the downtown district between the hours of 4:30 p.m. and 6:30 p.m. Checks made of the parked cars in the business district demonstrated the difficulty of enforcing limited parking restrictions.

Ernest A. Murphy, general manager United Traction Company, Albany, N. Y., described a survey made in that city. He called attention to the evils resulting from unwise, ill-considered and excessive traffic signal installation. Proper planning as to the arrangement, location and timing of signals was held to be essential to their intelligent use. Serious delays and waste of time, accompanied by restricted usefulness of street space, result from promiscuous and erratic signal installation.

In the absence of C. E. Morgan, vice-president Brooklyn City Railroad, the traffic situation in that densely populated community and the methods found necessary for expediting street car movement were presented by A. L. Hodges, assistant to the general manager. His paper is abstracted elsewhere.

W. E. Thompson, vice-president Third Avenue Railway, New York, complimented Mr. McIlraith on the work done in Chicago toward the scientific improvement of street traffic conditions. He mentioned particularly the value of the progressive control system which resulted from the studies made in Chicago.

Recent Car Developments

In his presentation of recent developments in electric railway equipment, F. M. Brinckerhoff described the experimental car developed by the Springfield Street Railway and the articulated cars of the Washington, Baltimore & Annapolis property. He also mentioned the "triplex" cars developed for the B.-M.T. subway system, the new cars of the New York, Westchester & Boston Railway, new suburban cars of the Pennsylvania Railroad for service in the Philadelphia area and recently acquired locomotives of the Virginian Railroad and the Great Northern. Mr. Brinckerhoff illustrated by lantern slides some of the features of these various units, which

COMING MEETINGS OF *Electric Railway and Allied Associations*

July 11-14—American Society Civil Engineers, convention, Denver, Col.

July 22, 23—Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.

Digitized by Google

previously have been described in ELECTRIC RAILWAY JOURNAL. Representatives of the Timken-Detroit Axle Company discussed some of the features of design in the Springfield, Mass., worm-drive car. In answer to a question, W. L. Harwood, engineer of power and equipment Springfield Street Railway, said that the unsprung weight in the experimental worm-drive car is approximately 100 lb. per wheel less than the lightest form of conventional street railway truck with the same motor capacity.

David I. Walsh, United States Senator from Massachusetts, speaking at the dinner on Saturday evening, stressed the importance of co-operation among electric railways in meeting their difficulties. These, he said, are as serious as those faced by any industry in the country, and can be overcome only through united effort.

W. G. Gove, superintendent of equipment Brooklyn-Manhattan Transit Company, New York, was unanimously elected president of the association for the coming year; W. E. Thompson, vice-president Third Avenue Railway, New York, was elected first vice-president; Ernest A Murphy, Albany, second vice-president; R. R. Hadsell, Rochester, third vice-president, and W. F. Stanton, Rochester, secretary-treasurer. Frank Hedley, H. B. Weatherwax, J. F. Hamilton and S. W. Huff were re-elected members of the executive committee.

Coney Island Shops of the New York Rapid Transit Corporation*

BY R. A. MARSHALL†
Supervising Engineer Shop Equipment

WHAT are known as the new Coney Island shops of the B.-M.T. lines are now approaching completion. These shops and yards are located in Brooklyn between the Sea Beach and Culver lines of the railway and extend from Avenue X south to Coney Island Creek. Connections will be provided to the Culver, Sea Beach and West End lines and through the Coney Island terminal to the Brighton Beach line of the railway. The shops will replace the present inadequate shops located at 39th Street and East New York. They are designed to maintain 2,000 subway cars in service and liberal provision is made for the expansion of each department to meet the future demands. The preliminary plans were developed by the railway with the assistance of the engineering firm of Dwight P. Robinson & Company. They were turned over to the Board of Transportation, by which the building plans and contracts were prepared. The equipment plans and specifications, including selection of machines, were made by the railway.

The buildings comprise the inspection shed, main repair shop, store house, oil house, boiler house, office building and electrical repair shop. They have a total floor area of 546,000 sq.ft., or about 13 acres; the approximate cost of the entire plant as provided under the dual contract was estimated as $12,000,000, but with extensions provided for the ultimate cost will be considerably greater.

The building site is on the old marsh along Coney Island Creek. Most of this area was filled with subway excavation from a depth of 7 ft. to 12 ft. a number of years ago. The settlement of this fill had displaced the underlying mud in many places and had formed mud waves, which made an unsatisfactory foundation. The site was graded and the surcharge moved into the low and unfilled portions. Concrete piles were then driven for the support of the building structure.

STEEL AND BRICK USED

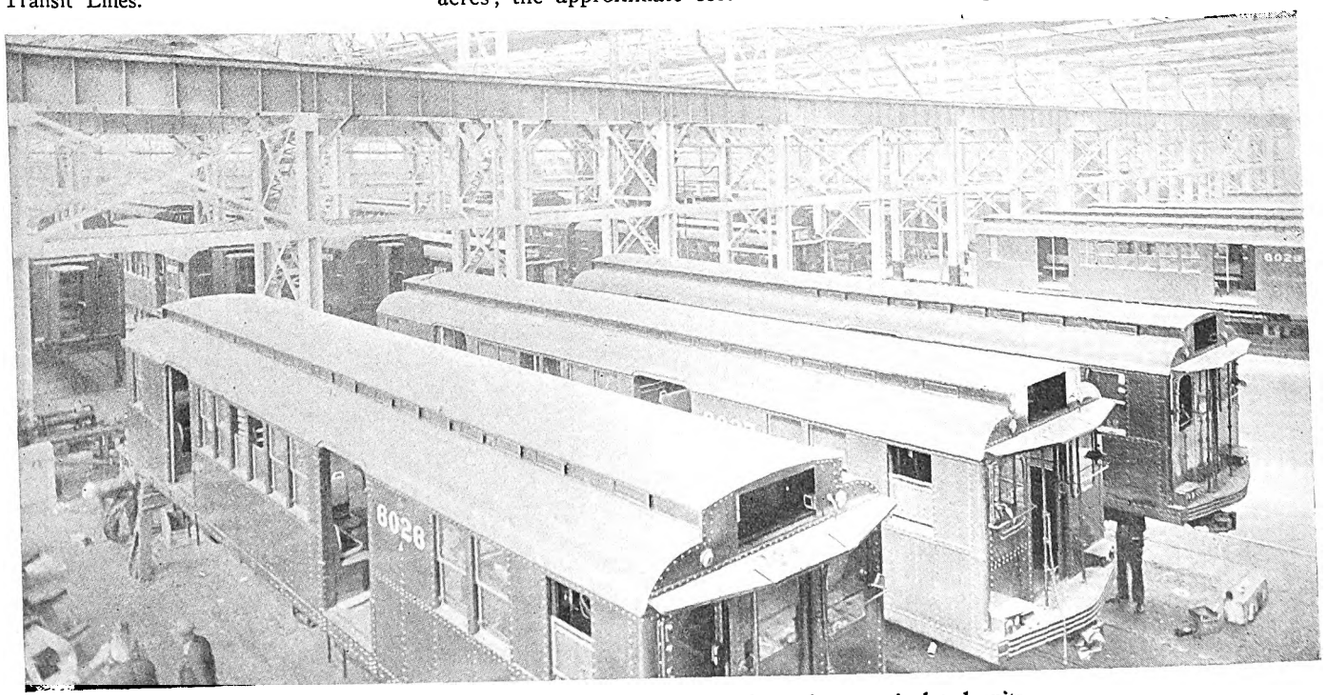
The building construction consists of complete structural steel frames with brick walls, steel sash and concrete roof slabs covered with five-ply roofing. The buildings have large side wall sash and the roof, which is flat, consists of alternate high and low panels supported on the bottom and top chords of the roof trusses. At each truss there is a continuous line of top hung sash, inclined at an angle of approximately 27 deg. to the vertical, thus distributing ample natural illumination to all parts of the buildings. The overhead sash, skylights and movable ventilating sections of the side wall sash are glazed with ¼-in. wire glass; the other side wall sash is glazed with ¼-in. rough glass. All ventilating sections of windows and skylights are arranged to be operated from the floor.

The electrical repair shop was the first building to be constructed as it was needed to replace the old shop at 52d Street. This was described in ELECTRIC RAILWAY JOURNAL, issues of Dec. 18, 1926, and Jan. 15, 1927. The other main buildings are approaching completion.

The inspection shed on the west side

*Abstract of paper presented at annual meeting of New York Electric Railway Association, Bluff Point, N. Y., June 24, 1927.

†Presented by W. G. Gove, superintendent of equipment Brooklyn-Manhattan Transit Lines.



Interior of car repair shop. The cars are sections of new articulated units

Special slings are used in lifting and handling trucks to raised stands for repairs

of the group is 86 ft. wide by 600 ft. long and has four tracks with pits, bench space and storage room. Cars leaving the repair shop pass through the inspection shed for final inspection and adjustment of brake rigging, etc., before entering service.

The west side of the main shop building, known as the intermediate repair shop, will be used for truck and running repairs. This building is 80 ft. wide by 480 ft. long with two tracks connected to the yard at each end. Each track will be equipped with a drop type transfer table, by which damaged trucks can be removed and good-order trucks replaced under cars. The central bay of this building, 43 ft. wide, will be used for truck overhauling and repairs and is equipped with two 15-ton cranes.

The south end of the main building is one large room, 255 ft. long and 520 ft. wide. It is divided into three 75-ft. bays, extending east and west, with 10-ft. trucking aisles between the same. Each 75-ft. bay is served by a 30-ton overhead crane equipped with two 15-ton trolleys. The tracks in this building are 20 ft. apart. The track along the west wall will be used for high-tension test purposes, the testing unit being located on a platform above the track. Adjacent to this track and occupying the west end of the building are nine tracks, or space for 27 cars, providing for repairs to damaged cars and for car construction work. The central part of the room is assigned for scheduled car overhauling. For this purpose the cars will enter the shop from the south on the stripping track and the car bodies will be removed from the trucks by the overhead cranes and placed upon specially designed steel horses which are high enough to permit ready access to the equipment under the car body and without the use of pits. The trucks will continue through on the stripping track to the truck shop in the north end for overhauling. Seats and equipment parts will be removed from the car body and transported by storage battery trucks to the appropriate departments for repairs. After repairs have been made the car body will be moved by the overhead crane to the east end of the building, where it will be painted, then taken again by crane to the wheeling and trim tracks, where it will be placed on the trucks coming out of the truck repair shop.

In order to keep the shop as clean as possible, cars before entering the repair shop will be cleaned in the cleaning room at the southeast corner of the building. As this shop is essentially a steel car repair shop, the wood mill and carpenter shop are of minor importance as compared with the usual shop. This work is accommodated in a one-story building 40 ft. x 230 ft. directly east of and connected to the paint shop and transfer bay.

Transfer Bay Connects the Departments

The north end of the building is devoted to truck overhauling, machine and blacksmith work and miscellaneous repairs. Between these departments and the scheduled car repair shop there is a cross transfer bay 40 ft. wide and 640 ft. long, served with two 15-ton cranes at a height of 30 ft. This transfer bay furnishes cross-movement and direct access to every department of the shop. The cranes north of the transfer bay are at a lower level and extend into the transfer bay for ready exchange of loads from one crane to the other. Between the transfer bay and the scheduled car repair shop is an area 60 ft. wide by 560 ft. long with a mezzanine floor 40 ft. wide above. On the ground floor are located departments for rigging, sheet metal work, electrical construction work, pipefitting and shoe beam work. These departments are thus located close to the car repair work. Storage of parts and supplies are also located in this section. On the mezzanine floor curtain and sign work and seat cleaning and repairs will be done.

The northeast corner of the building, which is nearest the entrance, provides accommodations for employees. This room is equipped with 32 circular Bradley wash fountains, each capable of accommodating eight to ten men at one time. Space is also provided for 1,000 of the railroad company's standard metal clothes lockers, which are 12 in. x 18 in. x 6 ft. high. Directly south of the wash and locker room a first-aid room is provided. This will be equipped with the usual first-aid room facilities. The upper floor over the wash and locker room, 60 ft. x 200 ft., and on the same level as the shop mezzanine, is allocated for lunch room and recreation purposes. Toilet facilities are provided in rooms on the mezzanine with direct stairway access from the main floor. Isolated urinals are provided at frequent and convenient locations on the main floor throughout the shop. Drinking fountains are also provided at convenient locations throughout the shop. These fountains have an ice chamber with coil, thus providing cold water for the employees.

East of the main shop there is a two-story fireproof storehouse 60 ft. x 300 ft. and designed for a future third story. The second story is connected to the main shop by a bridge on the mezzanine level, by which truckloads of material can pass through the mezzanine of the main shop and over a second bridge into the inspection shed. Elevators of 10,000 lb. capacity are provided in the store house, main shop and inspection shed. The elevators have 8-ft. x 12-ft. platforms and a speed of 75 ft. per minute. The control is of the push-button type, thus dispensing with the need of operators.

East of the store house are located the oil house and office building. The oil house is a one-story-and-basement building, the basement being devoted to tank storage of lubricating oils, with space for waste, etc. An elevator handles material to and from the basement. The main floor will be occupied

Digitized by Google

by oil pumps, barrel racks with tiering machine, etc. Part of this floor will be used for the renovation of waste, the treatment of journal box packing and paint and paint brush storage. The distribution of the lubricating oils to this large plant has been given special study and the Bowser system used throughout. Oils will be received in tank car shipments, unloaded through fill pipes to tanks in the basement and then pumped by motor-driven pumps to various stations throughout the shop where the oil will be drawn for use. At each of these stations will be located 120-gal. tanks with hand pumps for drawing oil. The supply of oil from the oil house to these small tanks is controlled by remote control valves at each tank. When necessary to replenish the supply of oil in a distribution tank the operator opens the remote control valve, which automatically starts the oil pump in the oil house. Oils that are used in small quantities will be transported in drums or portable tanks on storage battery trucks.

The office building is fireproof, 50 ft. x 110 ft., two stories in height and planned for a future third story. This is located close to the entrance gates and will house the offices and drafting room of the mechanical department. Two vaults are provided for storing drawings and records. There will be a gatehouse with a waiting room and employment office at the yard entrance, where will be stationed a watchman.

Heating is provided from a central heating plant located in a separate building, the equipment consisting of two 400-hp. Heine water-tube boilers equipped with Bethlehem-Dahl oil burners and capable of operating at 200 per cent rating. Space is also provided for two additional boilers. Sea grade fuel oil is used and storage is provided in three 8,500-gal. tanks buried in the yard. The boilers are connected through overhead flues to an 8-ft. x 200-ft. radial brick stack. Steam is generated at 160-lb. pressure and distributed at this pressure through mains to pressure reducing valves, where the pressure is reduced to 5 lb. The shops are heated by 71 unit heaters containing heating coils and electrically driven fans. The regular 600-volt d.c. railway current, furnished through a separate feeder from the Avenue U substation, is used for light and power.

Although the buildings are either fireproof or of non-burnable construction and the shops are to be used for repairing steel cars, fire protection has been given consideration by the provision of an 8-in. water main loop around the shops and connected to the city mains. In addition to the yard hydrants, interior standpipes with hose are provided throughout the shop. In the oil house there are also high-pressure steam pipes with outside control valves for smothering fire inside of the building.

The machine tool equipment has been given special study by the tool committee, which has recommended equipment suitable for maintenance.

Five Causes of Traffic Congestion*

By A. Leroy Hodges
Assistant Secretary Brooklyn City Railroad

EXPERTS have agreed on five principal causes for "Traffic Congestion."

1. *The many-floored office buildings.* Contrary to general belief, we have them in Brooklyn, too. We have a new building of 35 stories. And now I read in the New York *Times* of June 21 that the Broadway Association of Manhattan is considerably worried over the serious traffic problem created by the proposed 110-story Larkin Tower on West 42d Street. It is said by the traffic committee of this Broadway Association that each floor of a large office building adds 1,000 persons to the crowds to be handled.

2. *Insufficient roadway and sidewalk space.* On reconstruction jobs, in many instances, cities are widening the street area by cutting back sidewalks, on the theory of increasing lanes of traffic when almost immediately this additional space is occupied by parked vehicles—and where parking is permitted the general results as far as facilitating movement of traffic are nil.

3. *The ever-increasing number of automotive vehicles.* The total registration of automobiles in the five boroughs of New York is in excess of 600,000, to which must be added the thousands of vehicles that come in daily from other parts of the country.

4. *Failure to provide sufficient paved roadways and to maintain them.* Often you will find the street area maintained by the railroad to be the best roadway for auto travel and, of course, it is used by the autos to the detriment of your railway service.

5. *The parking evil.* Deputy Chief Inspector Coleman in a talk before the Metropolitan Section, A.E.R.A., recently said that from his experience in the Traffic Division of the Police Department the greatest obstruction and the most frequent cause of delay to the free movement of traffic is inconsiderate parking, and he was referring to these long-time parkers.

As a matter of simple justice and common sense the rights and well being of the greatest number of people affected by traffic strangulation should receive first consideration. Surface cars carry 55 per cent of the total number of passengers carried on all transportation lines in the Borough of Brooklyn. Every student of the traffic problem realizes that the remedy lies in discouraging the use in congested sections of the inefficient carrier and encouraging the efficient carrier, the one which transports the most people by utilizing the least amount of roadway space. At present the reverse of this principle is being applied.

A pedestrian walking along the street requires 10 sq.ft. of street space, an automobile standing or parked requires 100 sq.ft., and if moving slowly requires 200 sq.ft. If this same automobile is speeded up to 15 m.p.h., it requires 300 sq.ft. of roadway, and if operating at 20 m.p.h. it requires 400 sq.ft. of roadway. It is very apparent therefore that an automobile is a spendthrift when it comes to wasting roadway area on the basis of space occupied per passenger. The parking prohibition will not only have the effect of opening up new lanes of travel but will also discourage the use of the inefficient carrier, the one hauling on an average 1.7 passengers in the more congested sections where these prohibitions are applied.

The only reason why practically unrestricted parking is permitted is that certain shortsighted merchants have been able to exert a certain influence in favor of the practice. In their eagerness to encourage the parking of cars in front of their stores they forget that they are making these stores inaccessible to other potential customers who travel in private cars, in taxicabs, in street cars and in buses.

Few Store Customers Use Automobiles

In co-operation with some of the retail merchants of Brooklyn, a check was taken some time ago to determine what mode of transportation the patrons of these stores used, and it was discovered that less than 9 per cent came by private automobile, and yet these same merchants deplore any "no parking" restrictions which may be placed in effect.

If it is within the province of the Police Department to set aside certain street areas for limited or unlimited parking space, why can they not take the same viewpoint of the center of the street, especially on those streets where street car tracks are located, and keep them open for the free movement of mass transportation? If the parking was cut back 150 or 200 ft. from the corner so that automobile traffic could have the unrestricted use of the street between the car tracks and the curb, it would mean much in the handling of traffic.

As it is at present, with the parking to the building line and automobile traffic on the car tracks, it simply means that when traffic is resumed the movement of the street car, which is carrying approximately 85 per cent of the persons using the street, is restricted to the speed of the slowest vehicle, when such vehicle is occupying the track area.

Cruising taxicabs present another serious problem in that they retard the movement of traffic. These taxicabs do not want to move fast, and the chauffeur

*Abstract of paper before annual meeting New York Electric Railway Association, Bluff Point, N. Y., June 24, 1927.

Digitized by Google

will hold back at busy street crossings, hoping to be stopped by signal, so that while standing waiting for the signal to proceed he will get a passenger. A quick trip through the crowded area without picking up a passenger means circling around and trying again, so that the policy of these taxi chauffeurs is to move as slowly as possible until they secure a fare.

It is up to us transportation men to educate our patrons and our citizens to the economic loss as a result of these conditions, but only until they are awakened to the situation can we expect its real solution.

Promoting the Best Use of City Streets*

By E. J. McIlraith
Staff Engineer Chicago Surface Lines

CONCENTRATION of business administrative agencies in relatively small areas in large cities has ample justification. From time immemorial cities have been the seats of trading and administrative power. Even today business prestige and business accomplishments are promoted by a city location that is conveniently accessible to those with whom one expects to do business. In spite of all rapid and convenient means of communication it is still vitally important that men have personal contact in order to do business best.

A city which is a strategic center within a great area of the country is an excellent location from which administrative, engineering, distributing and advisory control may most profitably be exercised over much of the activity of that area. It is not chance, but economic necessity, that centers such leadership in the various large cities. It is equally a necessity that these dominating forces centered in the city should concentrate in a small area in order to promote the effective use of the time of the individuals.

Manufacturing, certain retailing, warehousing and similar activities should, of course, be spread about appropriately and kept away from the central area.

There is vital need to provide facilities that will permit a close centralization of the leadership of the country, and no need of thinking it impossible to provide adequate accessibility for the large buildings or for the concentrated area in which these buildings are placed. We are, however, confronted more and more vividly each succeeding year with the threat of too serious congestion, and the very rapid rate of change in intensity of use of the central business area is making the problem of providing accessibility one that must be answered correctly at once.

A complete solution of the problem of providing accessibility involves improvements in transportation methods and facilities as well as the control of street use. The greater cities are planning and developing better rapid transit. In Chicago the use of an underground pedestrian level to permit pedestrians to have the whole street width to themselves without vehicular interference or weather inconvenience is a fixed part of the plan. Such a development is not expensive, but of enormous value in increasing the convenience of all movement and in using the central area to its maximum advantage. Some day moving sidewalks will be used to decrease the time and effort needed in moving horizontally in central business districts, as elevators and moving stairways serve for vertical movements. Concentration simplifies in many ways the problem of providing conveniences.

*Abstract of address before annual meeting New York Electric Railway Association, Bluff Point, New York, June 24, 25, 1927.

Railway Managements' Obligation

No organization or interest can be so vitally affected by, or should be so intensely concerned over, the development of traffic regulation and the promotion of the best usefulness for the streets as is the management of the transportation company. The company's business is that of transporting people. Its vital concern is in maintaining the highest degree of usefulness for its service. The management also has an unmistakable obligation to represent successfully the interests of the people whom it serves, and this is a major portion of the citizens living within the city. Each railway management is under obligation by the nature of its business to assume leadership in working out the traffic problem of the city in which it operates. Very few have assumed this obligation. Most railway managements are giving half-hearted support to a police department, or to whatever other casual body is attempting to control traffic.

The country's prosperity creates a widespread desire for the use of private automobiles for casual purposes, to gratify the longing for individual prestige and individual personal luxury. That is creating the present congestion. More people would drive cars daily if there were more streets.

Each citizen, including ourselves, finds it an advantage at times to use an automobile, and each at times finds it desirable to use a public conveyance. Yet, since one street car with 40 passengers carries as many people as 22 average automobiles, and one car carrying 60 passengers is equivalent to 33 automobiles, it is evident that with a growing number of people to be served an increasing proportion must use the public vehicles. It is the abuse of privilege in using private automobiles that must be controlled.

Traffic planning must, therefore, promote to the best possible extent the mutual interests of the various units using the street, giving special consideration to the greatest good to the greatest number and providing the maximum value to the community in the service rendered by the streets. That may sound like a glittering generality, but if each feature under consideration is made to pass scrutiny from this point of view explicit decisions are not so hard to make.

Many Causes of Interference

There are many features of street use that must be analyzed and considered in developing regulations and an appropriate traffic control plan. It is not sufficient to consider ways and means of moving traffic by signal systems or how to regulate turning movements. The whole problem consists in providing adequate regulation for each of the factors involved that is appropriate to the various locations within the city and to various hours of the day. Some of the items most prominent at this time are: Parking on city streets; the signal system or other intersection control; turning movements; pedestrian movements; segregation of types of vehicles; delivery of heavy material; loading and unloading of service vehicles; street blocking around buildings under construction; cruising of taxicabs or of chauffeur-driven cars; taxicab stands; sightseeing bus stands; street repair work; repair work in manholes; sidewalk obstructions; contour and condition of paving; radius of curb corners; location of loading zones for private automobiles, taxicabs, buses; detour trucking routes; training of drivers; development of a sense of responsibility with police forces and in courts toward control of carelessness on the streets.

Parking Waste Street Space

Parking is absolutely a desirable feature of street use in places, but a completely inexcusable waste in others. To be specific as to the latter, let me illustrate with figures from Chicago. There are 122,000 trips of vehicles into the central business section, less than 1 mile square, between 7 a.m. and 7 p.m. of a business day. Of course, this counts many trips for some vehicles, so that a considerably smaller number of individual automobiles, taxicabs, buses and service vehicles are actually appearing in this section on one day.

Of these trips only 18,200, or 15 per cent, can find parking space legally available, if each one uses that space for the prescribed half hour. Since it is utterly impossible to enforce a definite time limit, a much smaller number is actually able to use the parking space. The other 85 per cent or more are able, however, to do their necessary business without using street

Digitized by Google

parking space. Many merely load or unload passengers or goods, many are passing through without stopping, and an appreciable number use off-street storage space. A careful check made by the business houses themselves shows that for 96,082 people interviewed in banks, stores, office buildings, restaurants, but not including the employees, only 1.57 per cent used curb parking space and the results were much the same in all classes of business. Now if so small a percentage is using the privilege of parking at the curb, is it an important proposition? If 85 per cent of the vehicles are able to serve their drivers' needs without using curb parking space, why shouldn't the other 15 per cent? What merchant or restaurant owner has set aside or could consider using any part of his building for free parking space for his customers? Yet space inside property lines is less valuable to the community or to the property owners than is the street space alongside that provides accessibility. Some merchants are taking the customers' cars at the store door and driving them to garages, but they cannot set aside garage space free in a busy business center. Yet custom has permitted the use of street spaces as in the days of the old hitching posts. With parking filling the curb lanes, as in all business centers of all cities, there is not sufficient opportunity for service vehicles, taxicabs or automobiles to pull quickly to the curb to load or unload. Much of this has to be done while the vehicle stands in the lane outside the line of parked vehicles, or on a crosswalk, or in front of an alley, or on the car track, or in fact wherever, in desperation, the driver finally concludes to take a chance.

The whole flow of business for 98.43 per cent of people is terribly handicapped in Chicago for the privilege of granting special convenience to 1.57 per cent who park. The speed of movement for the 98 per cent could be increased at least 50 per cent if the 1.57 per cent of people were made to do what the great majority of the automobile users have found it best to do. If an automobile has a value to its user, it must have a value greater than 50 and 75 cents or a dollar a day that it would cost him for day storage. It costs 10 cents to 20 cents per mile to own and operate an automobile. The owner making a single trip to a business center drives an average of at least 5 miles each way, and therefore spends for such operation from $1 to $2 per trip. If he is willing and able to do so his business and comfort must be valuable to him. Is it, then, not reasonable to expect him to add the cost of garage storage instead of turning the most valuable property in the whole city to his personal use, when such use prevents reasonable accessibility to the business houses and offices, cuts the usefulness of the street to half its normal capacity in most cases, and threatens to destroy the convenience of doing business in the present busy centers? Parking is an utterly inexcusable economic waste and handicap to business where the full street width is essential for moving traffic together with the controlled and unescapable loading and unloading of passengers and goods. Let us illustrate in another way. If in Chicago's Loop district each person entering loses ten minutes per day due to the congestion caused by parking, and this is low, the total time wasted is equivalent to 470 minutes, or nearly eight hours, for each automobile that may be parked legally within that area in the business day. Each automobile parking for a half-hour period costs eight hours waste of time for others, as a conservative estimate. On what basis can such a great economic nuisance be defended? Has any one ever compiled any statistics to show that parking is an economic necessity in busy districts or along busy streets? The freedom of movement in busy districts would be so greatly promoted if parking were eliminated that it would be the equivalent of an increase of fully 50 per cent in street width without any decrease in the available building area or of taxable land such as would result from actual street widening.

Some Parking Permissible

It is not necessary to eliminate parking over all streets adjacent to busy sections of a city. It is only necessary where traffic requires the full street for reasonable freedom of movement, and where space must be set aside for loading and unloading service vehicles, buses, taxicabs or private automobiles. Much harm can be done by over-enthusiastic limits to parking. Limitations at choking points, near all active intersections, on all streets where the volume of moving traffic requires the full street width for reasonable freedom of movement are absolutely necessary.

Correct use of a street having no parking involves also the prevention of loading or unloading of any vehicles, automobiles, buses or taxicabs within at least 100 ft. of an intersection. This is necessary so that the traffic may approach an intersection, which is always the controlling point limiting the street capacity, with all lanes from curb to curb available for their movement. It is quite important, too, that lanes be marked off approaching the busier intersections, so vehicles will align themselves to get the best use of the street width instead of spreading themselves carelessly about. This feature of providing loading space toward the center of the block and keeping the curb lanes free for at least 100 ft. back from an intersection is very effective in providing greater street capacity, greater freedom of movement, higher speed and improved safety.

Parking Regulation Not New

Parking restriction is not a new regulation and should not be presented as such. It has long been evident that parking on boulevards, in front of certain buildings or along busy streets in the busiest rush hours of traffic could not be for the best interests of the majority, and such restrictions are in effect in all cities. We have now to realize that the growing use of automobiles has created excessive pressure of traffic through all business hours of the day and on many more streets. City councils and traffic control authorities are slow to increase the restrictions unless pressed or furnished with adequate proof of the need. Proof is not hard to get for those areas where the restrictions are needed, yet it is difficult to get united pressure from civic or business groups, because they are not students of the problem and have colored opinions of the need for unlimited freedom of parking privilege. Each merchant hopes to get customers from those who park before his neighbor's store. He doesn't, however, study the relative value of parking compared to the damage from congestion.

This old idea must be dissipated by data and facts. Unlimited personal freedom is no longer possible in any phase of city life, and unrestricted parking in many sections seems entirely too violent an offense against the welfare of the citizens to be longer permitted. City life is becoming complex, but communication must be retained. There may come a time when, because of greater convenience and economy, private automobiles will be used very little in large cities unless chauffeur-driven, but all needing special personal service will use taxicabs, which have the advantage of being paid off and released for another customer as soon as one is delivered.

Allied with parking is the special privilege stand for taxicabs or sightseeing buses. Loading zones for these vehicles in common with other vehicles should be established and the taxicabs must be stored and kept waiting for call in off-street storage space. Push-button call service and telephone service must supplant the present method of crowding out all other vehicles in the neighborhood of hotels, railway stations or other places where many people congregate.

Unnecessary Street Blocking in Busy Hours

An extremely important source of trouble in creating street confusion is from the various forms of street repair work. There is rarely need for such work being done between 8 a.m. and 6 p.m. These hours should be kept for moving street traffic, that is the lifeblood of business life. There is altogether too much disturbance of traffic and business in the vicinity of buildings under construction, and good planning can eliminate most of the trouble. Delivery of heavy merchandise and bulky or heavy material should be prohibited in busy streets during the business day. There is no good reason why coal, ashes, general freight and general delivery service cannot move while the streets are virtually free of other traffic. Trucks traveling from one side of the city to the other should be moved on good detour routes outside the central district.

Digitized by Google

The success of each city depends on the organization of its business so that its cost of distribution, costs of public improvements, costs of delays and comfortable living and doing business within the city are kept within reason. The present use of the city streets is not reasonably efficient, yet the streets are the most vital elements in permitting communication, and so in permitting city life. Streets are congested during 35 per cent of the time and vacant for the rest of the day. Before spending huge sums in street widening or in creating new streets, why not cut out some of the confusion in a simple way?

Chicago's Loop district is functioning better today than are the similar districts in most large cities. Much of the credit for this can be traced to the use of the Chicago tunnel system for handling the heavy freight, coal, ashes, excavations for building foundations and merchandise. There would be more than 5,000 more trips of trucks through the central district per day if the tunnel were not in use. Much other improvement has been developed by careful study, analysis and co-operation from the organizations having membership in the Association of Commerce.

Traffic Signals Help

Signal control has proved its value in reducing conflicts and promoting freer movement at intersections. Yet most of the signal control in use in this country has not been suitably adapted to give the best usefulness to the intersections or to the streets.

Signals are usually bought and sold as so much hardware, and the city administration is rarely willing to obtain technical advice on the most suitable type of control, the correct timing, the correct grouping of signals, or such other vital factors. Most signals are working under synchronous control, or where a synchronous control has been arranged to give reverse indications in alternate signals or in alternate groups of signals. Such signals are very rarely sufficiently effective and not only waste street capacity, but waste time for each person using the street. For a few dollars spent for engineering study and a slight increase in cost for equipment an appropriate signal system can be installed which will provide very much better operating conditions.

The co-ordinated traffic control method which was originated in Chicago provides maximum flexibility possible for any street arrangement, permits continuous movement throughout the controlled section and limits successfully the maximum speed that can be attained.

Traffic Enforcement Essential

In most cities at least there is too much tendency for both the police and the courts to belittle the importance of traffic code violations. The result is carelessness of drivers—undue exercise of personal whims in driving, parking, and ignoring the safety of others. It is such carelessness that costs hundreds of thousands of lives and much unnecessary suffering. Campaigns of education and pleas for safety are necessary, valuable, and must be continuous, but the fear of penalties and respect for a rigid justice is tremendously more effective. There must be an enforcement that is based on rigid, unflinching application of the laws that create safety for all users of the street.

May I recall again the most important feature I wish to leave with you, namely, that the railway managements must develop to be the acknowledged leaders in the technical job of traffic control. It is an obligation, a privilege, an opportunity, but there must be developed a thorough skill and a complete knowledge of principles. Traffic engineering requires competent men who are trained and experienced, but it is of outstanding importance in the modern city life.

Motor Vehicle Taxes Vary Widely in Different States*

By Henry R. Trumbower
Professor of Economics University of Wisconsin

OBTAINING adequate funds for the maintenance of highways has from time immemorial been a difficult and serious problem for communities. In the early history of this country it was found expedient by state and local governments to delegate the maintenance of the relatively more traveled roads to private organizations known as turnpike companies. In recent years, probably because of the more general and intensive use of the highways brought by the automobile, the pendulum of public opinion has swung in the opposite direction. Roads which were once maintained as toll roads have become free, and it is generally held that the work of constructing and maintaining highways is a governmental function.

In railroad theory and practice it is maintained that the costs of operation have to be met by the revenues contributed by those who benefit directly or indirectly from the services rendered. Such was the theory applied to highway users in the days of the toll road. But that theory was gradually abandoned as the turnpike mileage decreased from year to year till the time came when public roads and highways were improved and maintained by the public through taxation in the same manner as schools were supported out of public funds. That was substantially the situation at the time just preceding the advent of the automobile. The situation has changed again and now the motor vehicle, which has become the chief user of the highways, is looked upon as a source of revenue with which highway expenses are to be met—at least in part.

In 1926 the motor vehicle revenues of the country amounted to $408,103,568: 54 per cent of this sum was derived from license fees and 46 per cent from gasoline taxes. A study of these motor vehicle revenue figures shows that for the past five years or so the states have come to rely more and more upon the gasoline tax as a source of funds for highway purposes. Although more than half of the total motor vehicle revenues is derived from license fees, the proportionate amount received from gasoline taxes has been steadily increasing. At the close of 1926 all the states except four—Massachusetts, New York, New Jersey and Illinois—were collecting a gasoline tax in order to obtain highway funds. Not only has there been an addition to the number of states in the gasoline tax column, but those states which were among the first to enact gasoline tax legislation have in succeeding years in almost every case stepped up the tax rate per gallon, so that there are now two states which collect a 5 cents tax. In the early years the policy of licensing automobiles was clearly regarded as a policing measure, and the fee charged in connection with the issuing of a license and identification tags was supposed to be just enough to cover the expenses incurred in connection with the operating of the licensing department of a state. That policy was discarded long ago. It is now the accepted purpose of a motor vehicle license fee system, which by the way has received the sanction of the courts. to raise revenues which are to go toward highway construction and maintenance.

Gasoline Taxes Large

In 1926 there were seventeen states each one of which collected a larger amount of money from the gasoline tax than from the motor vehicle license fees. This is an indication of the trend of the times with respect to the relationship of the gasoline tax revenues to those derived from license fees. In some states where the gasoline tax has been introduced or where the rate was advanced there was a corresponding reduction in license fees. but that has been by no means the general practice. In these seventeen states the license fees and the gasoline tax collections totaled $148,414,727: 39 per cent license fees and 61 per cent gasoline tax revenues.

The states have not yet worked out any uniform policy as to the relationship which each one of these methods of raising funds from the motor vehicle is to bear to the other. There is no doubt that a good deal of haphazard and

compromise legislation has been enacted along these lines. Great variations in the gasoline tax rate are noted. In addition there are many different principles and methods followed by the several states in classifying passenger automobiles and other types of motor vehicles for the purpose of determining the amount of license fees to be charged, and the fee for the same type or class of vehicle differs widely among the states.

Variations in motor vehicle license as between the several states are shown in Table I. A five-passenger car weighing 3,000 lb., 24-hp., costing $1,075 new is designated for this purpose. The annual license fee for this type of car varies all the way from $1 in the District of Columbia to $40 in Oregon. In this connection it should be observed that Oregon exempts automobiles from the personal property tax, whereas the District of Columbia does not. There are other states that regard the motor vehicle license fee as being in lieu of all other state and local taxes. In most of the states, however, motor vehicles are subject to local assessments and contribute their share toward the general property tax collections. The average license fee assessed against this type of a car in all of the states amounts to $14.50.

If it is further assumed that this specified car consumes annually 400 gal. of gasoline, the gasoline tax as it is collected in the country as a whole brings the range of the total license fee and gasoline tax charged against the car from $8 in Illinois to $52 in Oregon; the average amounts to $24.42. The gasoline tax averages $9.92 in spite of the fact that four of the states had no gasoline tax in effect in 1926. The gasoline tax in those states that collect this type of a tax varies for a consumption of 400 gal. from $4 to $20. The motor vehicle revenues (license fee and gasoline tax) tend to be higher on the average in the less developed and less densely populated states. According to this analysis there are fifteen states where it would cost less than $20 to operate this specified type of a car inclusive of license fees and gasoline taxes, and these fifteen states contain approximately half of the registered cars of the country.

The variations in motor bus license fees in the several states are just as great as they are in the case of passenger cars. That statement may also be true for motor trucks, but since the study made at this time does not include that type of a vehicle no definite statement can be made. In order to make a proper comparison of motor bus license fees and gasoline tax collections computations have also been made and are shown in Table II, which gives by states the license fees and gasoline tax charges of common type of bus. For these purposes the following specifications were set up: 20-passenger capacity, pneumatic tires, $8,000 cost, 9,000-lb. weight, 30 hp., 50,000 miles annual operation, $12,000 gross receipts, 7,142 gal. gasoline consumption. By applying the 1926 license fee schedules of each of the states to such a type of bus engaged in common carrier service over a regular route and between fixed termini it is found that the fees vary from $10.50 in Missouri to as much as $1,428.57 in Maryland. The higher level of license fees charged in a considerable number of states for motor bus operations is largely due to a recently adopted policy which seeks to make the license fee de-

TABLE II—LICENSE FEE AND GASOLINE TAX PAYMENTS FOR MOTOR BUS, 20-PASSENGER, PNEUMATIC TIRES, 9,000 LB., PRICE $8,000, 30 HP., 50,000 MILES ANNUALLY, $12,000 GROSS RECEIPTS, 7,142 GAL. GASOLINE CONSUMED, OPERATED OVER REGULAR ROUTE—1926

State	License Fee Amount	License Fee Per Cent of Total	Gasoline Tax Amount	Gasoline Tax Per Cent of Total	Total

pend largely on the amount of business done or the degree of highway use rather than to base it solely on the type or character of vehicles, as is the case of passenger cars. Where a gasoline tax exists there is an additional charge collected which tends to vary in proportion to mileage traveled.

There are now nine states that predicate their motor bus license fees on a mileage basis, either in the form of seat mileage, estimated ton mileage, passenger mileage, or vehicle mileage. It should be noted that all of these states have gasoline taxes in effect besides. Then there are six states in addition which base the amount of license substantially on gross revenues. In following this method mileage must be regarded as a factor, though not definitely expressed. These percentages upon gross receipts which constitute the amount to be paid for a license range all the way from 3 per cent to 6 per cent. All of these fifteen states that use mileage or gross revenues as the license fee basis exact comparatively high fees from motor buses that do an extensive business, as compared with the states which base their license fees upon such constant factors as weight, horsepower or seating capacity.

The gasoline tax amounts to a very considerable sum where extensive operations are involved. Taking into account both the license fees and the gasoline taxes for this type of a bus, as before specified, it is found the average for the different states is $453.85, but in individual states the total charges paid range from $30 in New Jersey to $1,571.41 in Maryland. The total license fees and gasoline taxes per motor bus of the given specifications amount to more than $1,000 in five states; there are twelve states in the $500-$999 group; 22 states in the $200-$499 group; and in ten states the total charges in each case are less than $200.

Ton-Mile Taxes Also Vary

Although there is not time nor space available to make an extensive comparison between the passenger car total charges and the total charges for motor buses for each of the states, it may be said that there are substantial variations when the figures contained in Table I and Table II are reduced to a ton-mile basis. Taking these specific types of cars again as the bases for the computations it is found that the total ton-mile charges (license fees and gasoline taxes) average 2.2 mills for the country as a whole; for the motor bus the average of the several states is 1.5 mills per ton-mile, or about 30 per cent less. That general situation exists in a great many of the states, but there are a few states where the reverse relationship holds true. In Maryland, where the passenger car charges are relatively low and the motor bus charges high, the ton-mile charges for buses is 5.2 mills and for passenger cars 1.4 mills, using again the vehicles with given specifications as the basis for computation. On the other hand, in New Jersey the passenger car charges are 0.8 mill per ton-mile and the motor bus charges but 0.1 mill.

A cursory sketch, as this has been, nevertheless ought to be sufficient to impress one with the fact that there is not only a wide divergence in the methods and bases followed in order to obtain revenues from motor vehicle operators, but that there is also no definite or tangible policy as to the proportionate amount of total highway expenditures which should in fairness and justice be borne by the users of the highways. As I view the situation, one of the main reasons why this condition exists is because there are so few fundamental facts regarding this problem which are available to members of a legislature who have such matters in charge.

It is only in the last few years that state authorities have realized the economic importance of conducting highway traffic surveys so that they may learn the character and the extent of highway use. The results of such surveys as conducted by the U. S. Bureau of Public Roads in co-operation with state highway departments furnish a basis for the formulation of highway finance policies as well as for construction and maintenance programs that will bring about a more equitable and fairer distribution of highway costs and expenses among the various classes composing the public.

Railroads for Long-Haul Service, Buses for Short Hauls*

By F. S. Scarr
Formerly Supervisor of Motor Transportation Pennsylvania Railroad

ANY tool of transportation which is economically justified is destined to fulfill its proper function, our selfish interest or narrow vision notwithstanding. We have always been prone, however, to forget the lessons of the past, and have in every instance neglected for a time the opportunities offered by advanced methods and devices. The brief history of the motor vehicle, and particularly its application to commercial needs, seems to indicate that we have again been obstructing the path of economic progress. Fortunately our unwise opposition appears to be near an end. Evidence on every hand points definitely to a better understanding between the old transportation order and the new.

The physical characteristics of the motor coach and the steam train naturally influence their economic relation. The motor coach is designed to handle small groups; it is highly flexible as to time of movement and route of travel, is not dependent upon rigid schedules, and approaches the convenience of individual service. The steam train is designed to handle large groups of passengers, it generally operates at higher speeds, and is confined in fixed schedules and routes.

The cost of motor coach operation is considerably less than that of the steam train; the relation being approximately 30 cents per mile (total cost) for the former and $1.10 or more per mile (out of pocket) for the steam train. If, for example, there were 300 passengers to be moved at one time from Philadelphia to Atlantic City, the steam train would be more economical, as it would cost approximately $1.10 per mile as compared to $3 per mile for ten motor coaches. However, if but 30 passengers were to be moved, the economic choice would be reversed, the steam train costing $1.10 per mile against but 30 cents for the motor coach.

Combining the physical and economic factors, we find the lower unit mile motor coach cost permitting a three or fourfold increase in schedule frequency at the same total cost, bringing the highway vehicle to a point of convenience more nearly in accord with the private automobile. The relation which these two vehicles bear to each other seems to narrow down to the following:

1. The more economical vehicle is determined by the volume and flow of traffic. (Approximately 100 passengers per trip being the dividing point.)
2. The convenience factor, generally speaking, for reasonable distances, completely favors the motor coach. (Distance, as it affects convenience, necessarily varies in every instance, depending upon traffic, road and other conditions that influence the rate of travel as compared with the same movement by rail. Distance is limited only by the willingness of the passenger to travel at what is usually the slower pace of the motor coach).

Division of traffic between the railway and highway is already in the process of adjustment. A review of the passenger traffic handled by the railroads of the United States during recent years indicates a rapid and steady increase from 1900 to 1910. The rapid increase ended abruptly at this period, and except for one brief decline continued to advance, but slowly, to a peak in 1920. From the 1920 peak to 1925 a sharp decline in total passengers carried has been experienced by the railroads, rather than the increase which was to be expected from increases in population and industrial development.

Accompanying the decline since 1920, however, the average journey per passenger has steadily lengthened; this, with other available facts, indicating that the long-haul traffic enjoyed by the railroads is increasing. The commutation

*Abstract of address presented at the annual convention of the Motor Bus Division, American Automobile Association, Philadelphia, June 15-17.

Digitized by Google

traffic has also increased steadily since 1920.

It is quite evident, therefore, that the only remaining class of traffic, i.e., the "short-haul single-ticket" or small group business, has declined sufficiently to account for the increase in long-haul and commutation traffic as well as the sharp decline in the total passengers handled.

The private automobile, which because of its convenience and flexibility has absorbed most of the traffic lost by the railroads, as generally indicated above, has also tremendously increased the riding habits of the people and thereby created a new and larger traffic peculiar to itself. The motor coach, advancing into the field of organized highway transportation, has drawn its traffic largely from the private automobile, and as traffic congestion and parking regulations become more severe and a more general knowledge is attained by the private automobile owner of the cost of supplying himself with this convenience, the motor coach will draw its patronage more and more from the private automobile rider.

A significant and important factor that must be considered in any forecast of the probable future relation of the steam train and motor coach transportation is the difference in route mileage used and potential. There are about 250,000 railroad route-miles in the country and except for minor extensions and many probable abandonments, rail transportation will be confined to these routes. The hard-surfaced highways have increased very rapidly during recent years; from 200,000 in 1910 to 557,000 in 1926. This growth will continue. There are in addition some 2,500,000 miles of unimproved roads. Considerably less than one-half of the hard-surfaced roads and probably not more than 5 per cent of the total road mileage is utilized by motor coach lines.

Motor Coaches Increase Volume of Passenger Traffic

It is not to be expected that the proportion of total route-miles indicates the potential relations of these two modes of travel, for the steam roads have by their pioneering efforts established routes of travel that must, generally speaking, endure for all time. However, as the railroad has tended to centralize or concentrate, by virtue of its fixed routes, so will the motor coach, with its tremendous potential route mileage, tend to disperse, and in so doing create for itself a constantly increasing volume of traffic, a sound business development and a permanent and prominent place in transportation.

The motor coach, in its own economic right, has a definite, a large and a sound development ahead. As a sound phase of transportation, it must bear certain definite relations to other modes and particularly to the steam railroads. These relations are not difficult to foretell, in the light of available facts and the steps being taken by transportation interests generally to bring about a better co-ordination of transportation facilities.

The tremendous loss of passenger traffic recently experienced by the railroads, amounting to more than $250,000,000 annually—compared to 1920—has affected almost exclusively the local passenger train revenues. A careful survey of this phase of railway transportation indicates that a large percentage of local steam passenger trains are not earning sufficient passenger revenues to pay the "out of pocket" costs. These trains are, therefore, generally averaging a smaller number of passengers than can be accommodated in a single 50-passenger motor coach. The through passenger business has been little affected, except in rare instances. Pending the development of commercial aviation, the steam train will probably continue to meet the long-haul requirements.

The foregoing, coupled with the obvious characteristics of the steam train and motor coach, leave little doubt about the future apportionment of available traffic. Of the mass of "large group" movement, the steam train will handle the long-haul portion for many years to come, and such of the short-haul portion as may not be handled by terminal rapid transit systems. Air transport will affect but little this class of traffic, at least for many years. Of the individual, or "small group" movement, the steam train will gradually give up much that still remains of the short-haul portion to highway transportation. The highways will also assume some small portion of the "longer haul." Aid transport will ultimately take the principal rôle in handling the long-haul, small-group traffic.

Regardless, however, of the manner that each local problem is solved, certain fundamentals must prevail. (1) Each mode of transportation must be used where economically suited. (2) Sound business organization and management must be maintained. (3) Complete co-ordination with other modes and other lines must be insured through co-operation or consolidation.

Wisconsin Accountants Hold Two-Day Meeting

PROCEDURE in accounting to be followed by the electric railway companies having large numbers and various kinds of transportation equipment constituted one of the principal topics at the two-day convention of the accounting section of the Wisconsin Utilities Association at Green Bay, June 17 and 18, which was attended by eighty utility company representatives.

M. Zass, assistant superintendent of rolling stock Milwaukee Electric Railway & Light Company, championed the idea that companies should use an accounting system that will group the various kinds of like equipment and then distribute costs on an hourly or daily basis. An abstract of his paper will appear in a future issue of the JOURNAL.

L. E. Gettle, chairman of the Wisconsin Railroad Commission, vigorously assailed the reproduction cost principle laid down by recent U. S. Supreme Court decisions, laying particular stress upon the alleged impossibility of reconciling the treatment of overhead expenses and going value under that doctrine.

He said that the Wisconsin Supreme Court, as well as other state Supreme Courts, has gone way beyond the intention expressed by the U. S. Supreme Court in applying the reproduction cost principle. He declared that the U. S. Supreme Court decision does not mean that controlling weight must be given to current prices. He applauded the recent decision of the Massachusetts Department of Public Utilities attacking the Supreme Court's attitude and said he believed that it represented the general opinion of practically all state regulatory commissions.

The value of a utility property as a going concern is the only value which that property can have for purposes of rate making, he said. The theory that the value must always be in excess of the cost or of the estimated cost of production of the physical property is utterly ridiculous. The utility which has not earned a profit and has no prospects of earning a profit is not worth the cost of its physical property, regardless of the theory of jurists or engineers or economists.

S. R. Hatch, Milwaukee Electric Railway & Light Company, in describing the accounting treatment of property retired, said that it closely parallels the accounting procedure, accorded additions to and betterments of its property. Difficulties encountered with this treatment in connection with property acquired through contract are being overcome by a property and plant record system now in process of development. It will consist of a property ledger, or series of ledgers, subsidiary to and controlled by the property and plant account in the general ledger, together with an underlying system of work order analysis.

C. B. Boulet, safety director Wisconsin Public Service Company, urged accountants to participate actively in the organized safety work of their companies. He said that through their contacts with the pay envelope they could encourage accident prevention thinking among all employees. He said that even accountants are not immune to accidents, citing the case of one large company which last year reported that five girls lost either parts of or entire fingers in addressograph work.

D. W. Faber, Wisconsin Public Service Corporation, was elected chairman of the accounting section and Louis P. Smith, Milwaukee Gas Light Company, was elected vice-chairman.

American Association News

Exhibits Will Exceed Any Previous Display

WITH 28 members present the exhibit committee of the American Electric Railway Association held an enthusiastic and constructive meeting in the offices of its chairman, Col. J. H. Alexander, in Cleveland on Wednesday, June 22.

As the first order of business Fred C. J. Dell, director of exhibits, made his report, the high lights of which are as follows:

When the convention opened last year it had actually assigned 119,007 sq.ft., of which 38,316 sq.ft. or 39⅓ per cent, was occupied by 31 bus, truck and body manufacturers. Out of a total of 107,543 sq.ft. applied for this year, 34,922 sq.ft., or approximately 33⅓ per cent, has been asked for by 29 bus, truck and body manufacturers. The director's report then outlined recommendations of the special manufacturers' committee appointed by President Sawyer, a meeting of which was held on May 19. These recommendations made to the executive committee, and afterward referred to Colonel Alexander, embody: (1) Opening of the exhibits on Saturday noon preceding the first session of the association. (2) That if the public is permitted to view the exhibit—not recommended by the committee—the date be fixed for Oct. 2, and the time from 3 p.m. to 10 p.m., and that the number of tickets issued to the public be controlled and limited in some manner to be arranged by the Cleveland convention committee. It was also recommended that if the baseball World Series is in progress, the scores should not be shown in the same conspicuous manner as was the practice last year. Additional recommendations covered the continuance of the organ recitals at approximately the same hours as last year, and the appointment of a special subcommittee to promote a large attendance of railroad operating men on Saturday and Sunday, Oct. 1 and 2. In making this last suggestion it was the special committee's thought that all street railway companies in the Middle West can promote week-end excursions to be attended by employees who would benefit by visiting the exhibit.

Mr. Bell, who acted in the capacity of secretary at the meeting, then read as a section of his report minutes of the meeting of the special sub-committee which was appointed to make tentative space layouts. Up to the close of business on June 15 the director had received 216 applications requesting approximately 104,143 sq.ft. of exhibition space; at the same period last year he had received 193 applications requesting approximately 95,001 sq.ft. Since June 15, Mr. Dell had received nine applications, bringing the total to date up to 225, requesting approximately 107,586 sq.ft.; the same date in 1926 he had a total of 193 applications requesting approximately 102,859 sq.ft. Other matters touched upon consisted in drawing the sub-committee's attention to the matter of location of noisy operating maintenance of way exhibits, and a résumé of the work done in securing the cooperation among automotive tool and parts people which had been accomplished this year through the co-operation of L. F. Stoll of the McGraw-Hill Publishing Company, Inc., some 200 representative companies having been solicited.

Following this report there was general discussion in the sub-committee regarding the placing of exhibits of a noise-producing character. Upon motion of Mr. Hauer, seconded by Mr. Hegeman, it was decided that all noise-producing exhibits should be located in the Esplanade, Section E, with the understanding that all exhibitors allotted space in this section should be free to operate their exhibts at all time. This motion was carried.

Among other questions broached at the meeting was the matter of authorizing the executive secretary and director of exhibits to cancel the space applications of any company which might not make payment for the exhibition space occupied or other outstanding obligations of the association within a reasonable period. This motion was carried. The work of the executive secretary, the chairman and director of exhibits, in connection with all details which had been accomplished previous to this meeting, was approved. Upon motion of Mr. Jenks the question of placing automotive service equipment such as snow sweepers, etc., in with track exhibits was discussed, the committee indorsing such a course. Next was discussed the showing of special automotive vehicles and bus equipment for testing brakeshoes, etc., in with track exhibits. It was so ordered.

The committee then took up the question of space assignment to all members who had applied, all of whom were awarded locations. In this connection it was pointed out that naturally there will be some disappointment occasioned by the locations as awarded. However, it was the committee's thought that this was to be expected when consideration is given to the fact that there were in some instances as many as a dozen applicants for the same space.

Further exhibit details the committee decided would be left to the chairman and the director of exhibits with power to act. The chairman announced that the next meeting of the committee would take place at the office of the director of exhibits, Cleveland Public Auditorium, at 10 a.m. Eastern standard time, Saturday, Oct. 1, 1927.

Committees appointed by Chairman Alexander at this meeting were as follows:

Decorations—J. C. McQuiston, chairman; B. A. Hegeman, Jr., L. W. Shugg and Fred C. J. Dell.

Space Duties—To visit each exhibitor, ascertain whether his space is satisfactory and to report to director of exhibits if there are any complaints.

C. E. Morgan and T. W. Casey—To visit with exhibitors in Section A, Arena Floor.

J. S. Pevear and S. P. McGough.—To visit with exhibitors in Section B, Exhibition Hall.

C. P. Billings and Roy A. Hauer.—To visit with exhibitors in Section C, Auditorium's West Wing.

B. C. Edgar and G. L. Kippenberger.—To visit with exhibitors in Section D, Open Air Track Space.

Harry Reid and C. S. Hawley.—To visit with exhibitors in Section E, Esplanade. Open air covered Maintenance of Way Space.

Power Duties: L. D. Bale, chairman; J. F. Egolf, R. N. Graham and A. L. Price.

Car and Bus Exhibits: C. H. Clark, chairman; H. Fort Flowers, A. P. Jenks, A. L. Kasemeier, G. L. Kippenberger, and A. M. Robinson.

Sub-Committee to Co-operate with Entertainment Committee: Stanley P. Seward, chairman; Herman Bender, Charles Gordon, and Fred B. Bullock.

Sub-Committee on Space Assignment for Track Exhibits: J. H. Alexander, chairman; C. H. Clark and Fred C. J. Dell.

In addition to these groups, the special manufacturers' committee consisted of Thomas Casey, chairman; M. B. Lambert, Charles R. Ellicott and J. R. Fitzpatrick, and the sub-committee of the exhibit committee of B. A. Hegeman, Jr., C. S. Hawley, R. A. Hauer, S. P. McGough, J. C. McQuiston and L. W. Shugg.

Those present at the general committee's meeting in Cleveland were: J. H. Alexander, chairman; J. R. Ammon representing E. C. Faber, L. D. Bale, Herman Bender, Fred B. Bullock, O. A. Broten and A. Frank Paul representing T. W. Casey, R. M. Campbell, C. H. Clark, H. Fort Flowers, R. A. Hauer, C. S. Hawley, B. A. Hegeman, Jr., A. P. Jenks, H. J. Kenfield, G. L. Kippenberger, S. P. McGough, J. C. McQuiston, A. L. Price, A. M. Robinson, S. P. Seward, L. F. Stoll representing Charles Gordon, L. W. Shugg, J. B. Wright representing S. G. Down, J. W. Welsh, executive secretary; Frank Campbell, secretary Cleveland convention committee; F. C. J. Dell, director of exhibits, and John Vignec, assistant to director of exhibits.

Power Transmission and Distribution

CONSIDERATION of sub-committee recommendations and discussion of subjects for next year occupied the time of the committee on power transmission and distribution at its final meeting held at association headquarters in New York, on June 17. The following were present: F. McVittie,

Digitized by Google

chairman; J. Walter Allen, W. H. Bassett, M. W. Cooke, J. H. Drew, J. C. Damon, C. L. Hancock, S. S. Hertz, K. J. Keith, A. J. Klatte, J. Leisenring, H. S. Murphy, J. F. Neild, W. J. Quinn, M. B. Rosevear, W. Schaake, A. Schlesinger, R. D. Wade, H. C. Casey representing G. F. Wennagel, and C. H. Jones, sponsor.

At the beginning of the meeting the committee discussed the new subjects which would be recommended for consideration of the subjects committee. In addition to the suggestions offered at the last meeting, topics recorded were: Clearance diagrams for equipment, car loading, etc.; severest load conditions for overhead wires and supporting structures; safety factors used in the design of overhead supporting structures and wires; insulation for overhead contact systems; the use of ferrous and non-ferrous materials for overhead construction; specifications for installation of feeder cables for city work; the limitations of reduced trolley voltage in congested areas. The committee will ask that special attention be given to a study of the life of trolley ears, the use of trolley armor, ears for grooved wire and the use of steel cross-arms for steel poles and cross-arm supports for wooden poles.

The sub-committee on the review of existing standards recommended certain changes in distribution specifications and proposed that the specifications for electric conduit construction be referred to next year's committee for review. It also was recommended that a special committee study the question of lightning protection of both car and line equipment.

Sub-committee No. 2 on specifications for catenary material will present a progress report this year, and next year's committee will continue the work of revising Manual sections D102-21 and D104-25.

The sub-committee on trolley wire wear will bring the work of the last two years up to date in this year's report. A design of a measuring device for trolley wire was exhibited and will be used to make up an instrument for trial purposes.

Indications from the report of sub-committee No. 4 on specifications of high-strength trolley wire point to a compromise with the A.S.T.M. Final action by both associations is needed to bring both specifications into agreement.

Reports on radio interference and inductive co-ordination showed that very little had occurred in these fields worth recording. Inasmuch as the work of these two committees overlap in certain phases the main committee voted that both subjects be assigned to one special committee next year.

The report of the sub-committee on feeder ties between automatic substations recommended that the subject be discontinued on account of the great effect which local conditions have on the subject. The main committee did not agree with the recommendation of the sub-committee and will request that a special committee be formed to consider the subject jointly with representatives of the power generation group.

The sub-committee assigned to the subject of comparison of operating methods reported progress and recommended continuance of the subject. The sub-committee investigating the possible reduction of the number of sizes of trolley wire reels reported that in its opinion three or four sizes would be adequate.

Power Generation and Conversion

VENTILATION of automatic substations and protection of mercury-arc rectifiers were the principal subjects discussed at the meeting of the committee on power generation and conversion of the Engineering Association held at association headquarters in New York, on June 9 and 10.

At the first morning session an informal discussion of the ventilation of automatic substations took place, but no definite conclusions were reached. In the afternoon the discussion of ventilation was temporarily resumed, after which the report of the sub-committee on rectifiers was presented by Mr. Doub. In the discussion which followed a number of changes were suggested in the sections on "Ratings" and "Automatic Operation," but on account of the absence of certain members interested in that topic further discussion was deferred until the next day. In the discussion on rectifiers, which continued the next morning, it was brought out that on account of the nature of the information and the lack of explanation and justification for the figures given it would be advisable to omit certain parts of the report and to treat the section on "Comments Received" in a general way.

The committee will recommend that a study be made next year of the advisability of separating the current-carrying parts on the switchboard from the control apparatus.

On the subject of ventilation of automatic substations the proper radiation factor for figuring heat dissipation by absorption occupied a great deal of the committee's attention. The results of several tests on substations showed that the actual calculated factor for figuring radiation was considerably higher than that given in Kent's handbook. The discussion showed that the value of this factor was affected by load and atmospheric conditions and that this factor became ineffective when constant heat conditions obtained. A number of suggestions were made for properly taking account of the effect of radiation, but it was finally decided to use a figure which would vary inversely with the load factor.

Plans were outlined to include in the report on automatic substation ventilation the tabulated results of tests made on several stations, plans and descriptions of other substations, a computation on the efficiency of air flow due to difference in temperature and a repetition of some of the more important cuts and diagrams which were published in last year's report. The report will also refer to those special conditions which make forced ventilation advisable.

A brief exposition of the subject of the most economical trolley voltage in congested districts will appear in this year's report, together with a recommendation that a definite study of this topic be made next year.

Those present included C. A. Butcher, Mr. Doub representing G. I. Wright, H. W. Codding, H. W. McRobbie, P. Blommers, H. A. Kidder, R. L. Weber, Otto Naef, R. G. Winans, F. W. Peters, G. H. Sohlberg, W. E. Bryan, chairman; L. D. Bale, sponsor, and G. C. Hecker of association headquarters.

Heavy Electric Traction

MATERIAL for the forthcoming annual report was considered at the third and final meeting of the committee on heavy electric traction of the Engineering Association, held at association headquarters, New York City, on June 17, 1927. Those present were H. F. Brown, chairman, A. H. Armstrong, Morris Buck, H. W. Cope, E. P. Chase representing J. V. B. Duer, H. H. Febrey, J. T. Hamilton, G. L. King representing J. H. Davis, M. W. Manz, L. S. Wells and G. C. Hecker.

Mr. Wells reported that there was no change to make in the Manual sections. In the discussion it was pointed out that the American Electric Railway Association now has a specification for light catenary construction, but which is unsuitable for heavy service. The American Railway Association has in preparation a specification for catenary construction for heavy traction. It was suggested that this committee wait until the American Railway Association specification is released next September, before further action.

Mr. Manz presented the report of the sub-committee on bonds, which follows up the work done last year on the same subject.

Mr. Hecker reported that the New York Public Library has accepted the bibliography and that publication has been authorized. While no date has been set, it is hoped to publish it in the library's bulletin early in 1928. Publication will continue serially until the entire bibliography is completed. It was recommended that the subject be dropped for next year.

Mr. Armstrong reported that on the subject of self-propelled cars his sub-committee has tabulated data from sixteen roads operating 191 motor cars and 92 trailers. It was agreed that the data would be prepared without identification of any of the roads.

Mr. Daus' report on train operation, with particular reference to articulated trains, was accepted and will be published in the annual report.

Mr. Cope presented a revision of the tabulation on electric locomotives. He also will furnish a revision of the chart showing mileage of electrified steam roads and the number of locomotives.

Purchase Committee Dismissed in Los Angeles

A report of the special committee formed recently to interview Henry E. Huntington or his representatives regarding the purchase of the Los Angeles Railway, Los Angeles, Cal., by the city has been made to the City Council.

The committee declared that due to the death of Mr. Huntington, his estate has gone into probate court and that the present trustees do not feel authorized to deal in this matter.

The committee, composed of Mayor Cryer, City Attorney J. E. Stephens and Councilmen Shaw and Sanborn, then asked to be discharged and was voted out by the Council.

Following the suggestion of Dr. Delos F. Wilcox, acting in an advisory capacity for the city of Los Angeles, Cal., the City Council on May 14 named a special committee to negotiate with Henry E. Huntington, the owner of the railway system, or his representative, as to the best price and the most favorable conditions for the acquisition without the necessity of issuing bonds against the general credit of the city. This committee was authorized to ascertain terms upon which the city can procure a standing option to buy the railway lines.

Some Chicago Bills Lost

A group of five Chicago transportation bills died in the Illinois General Assembly on June 30, being among 30 Senate bills which were stricken in the lower branch on second reading because there did not remain another legistive day on which they could be placed on final reading for passage. The five bills were introduced by Senator Richard J. Barr, Joliet. The Durso bill, which provided for a board of transportation for Chicago, and the McCluggage bill, which provided for a municipal public utilities commission, giving such commission the authority now vested in the Illinois Commerce Commission, both died in the Senate public utilities committee after having passed the House. An effort to bring them out of committee was unsuccessful because there did not remain the necessary three legislative days for their consideration.

Overtime Rates Slightly Higher in Toledo

Settlement of the wage issues, in question at Toledo, Ohio, for several weeks, was made possible when the employees of the Community Traction Company voted by a close margin to accept the final offer of the company.

The new agreement is substantially the same as the old, but provides slightly higher overtime rates and some other concessions in working conditions. The basic wage scale therefore will be 50 cents an hour for the first nine months, 52 cents an hour for the next three months and 55 cents an hour thereafter, with a bonus of 5 cents an hour for one-man car or bus operators. Under the new contract the company will increase the overtime rate from 75 to 82½ cents for two-man operation and from 80 to 90 cents on one-man cars and buses. Clauses which favor the men on meal relief, layover time and reporting time remain as in the 1926 contract. The company also agrees to a nine-hour day on all regular runs.

The men had asked for a flat increase of 10 cents an hour in wages on the basis that they have had no increase for four years. The company refused to consider arbitration on the ground that it had no desire to disturb general wage scales throughout the property and possibly by a downward revision.

The old contract expired on May 31. New provisions will be retroactive to that date.

Fares in Local Zones Raised in Boston

The Boston Elevated Railway, Boston, Mass., announces a change in fares, effective July 1. It has been selling five tickets for 30 cents, for use in local zones, and this rate is changed to four tickets for 25 cents, netting an increase of ¼ cent per ticket to the elevated.

At the same time the elevated management creates a straight 5-cent fare for children under fourteen years of age, to be effective until Labor Day. Wherever adults ride for 10 cents over the elevated system, surface cars, subways and elevated structure, children may ride for 5 cents. This is to stimulate outdoor life for children during the summer.

Eight Cents in St. Louis

Temporary New Rate in Effect for Six Months—Valuation Tentatively Set at $52,024,192—Delay Sought by City Refused—Franchise Being Negotiated

THE Missouri Public Service Commission on June 25 granted the United Railways, St. Louis, Mo., an 8-cent fare with the provision for the sale of two tokens for 15 cents. The new schedule will be in effect for six months from July 5 and thereafter until modified or terminated by the commission. It will be actually in effect until the completion of the present pending rate and valuation cases. These will require at least six months for final disposition.

The commission also fixed the tentative valuation of the company's property for rate-making purposes at $52,024,192 as of Dec. 31, 1926. It arrived at this amount by taking as a basis the valuation of $51,781,348 as of Jan. 1, 1919, fixed four years ago. To that amount was added $6,425,943 for betterments and additions since Jan. 1, 1919, or a total of $58,207,291, but $6,183,099 was deducted for depreciation.

An audit of the company's books had revealed that in the period mentioned the company had set aside from earnings for depreciation reserve $12,300,357, but had actually charged off only $6,117,258 for depreciation. The commission held that the difference between the depreciation reserve and the depreciation charge off or $183,099 should be deducted from the $58,207,291 total valuation on the theory that the company could not retain this as working capital.

The commission's auditors found that in 1926 the company had actually available for return on investment only $2,447,864 or 4.7 per cent on the tentative valuation. It is estimated that under the new schedule the amount available for return should be $3,686,700, or 7.1 per cent. The commission also ruled against the city's contention that the city and county lines should be divided.

The commission has left the way open for a higher valuation than $52,000,000 in its final decision. The city has not submitted any evidence in rebuttal to the claims of the company for the valuation of approximately $100,000,000.

City Counselor Muench had asked for a postponement of six months in further hearings on the company's application to enable the city to prepare properly its case in opposition to the higher fare, but also against the contentions of company officials for a valuation of approximately $100,000,000.

The reorganization committee in negotiations with city officials on a new franchise has agreed to accept a valuation of $60,000,000 under a 30-year service-at-cost franchise.

The evidence on earnings in 1926 showed company was entitled to relief on the basis of the 1919 valuation brought up to date, and this need was so pressing that an actual emergency existed, so the commission could not morally await the taking of the city's evidence against the reproduction new theory. The commission estimated that on the basis of the total passengers carried in 1926 the new fare would give the company additional revenue of $1,466,846 and would provide a return of 7.1 per cent on the tentative valu-

Digitized by Google

ation fixed. The increased fare was ordered, the commission stated because it was justified by the evidence presented and because of the delay sought by the city to prepare its case in opposition to the application.

Ten Cents on Syracuse Interurban

The Public Service Commission on June 29 authorized the Syracuse & Eastern Railroad to file a new schedule of fares on its lines from Syracuse, N. Y., through Fayetteville to Manlius and fixing the cash fare at 10 cents or 7½ cents ticket fare, tickets to be sold six for 45 cents on cars and four for 30 cents if purchased at the station. The company is also authorized to establish a new fare zone to be known as new city line to Stop 7-C zone, and within this new zone the company will add to its fare for passengers destined to points within the zone from points without the zone, or in the other direction, 4 cents for each cash fare, 5 cents for each ticket fare and 25 cents commutation ticket. This change will not affect passengers passing through the zone. The new regulations will be effective July 15, 1927.

At the same time, the complaint of Mayor Hanna against the railroad was dismissed. This complaint was filed on the ground that the railroad was charging two fares for passengers within the city limits. The city limits had been extended in 1926 to include what is known as Genesee Manor. The railroad then petitioned the commission for authority to establish two fare zones within the new city limits. Subsequently the railroad amended its petition to establish one fare zone within the city, the fare to be the same as on the New York State Railways. This amendment to its petition removed the cause of complaint by the Mayor. The present fare is 14 cents cash, or 12 cents ticket. The new fare under the petition within the city limits would be 10 cents cash and 7½ cents ticket.

Commissioner Brewster filed a memorandum in connection with the order in this case, which said that the change in rate would not increase revenues of the company, nor would it increase the fare paid by most of the riders because most of the traffic originated outside the city or beyond the present first 7-cent zone.

One-Man Cars Added

Eighteen more one-man cars were in operation on June 1 on the lines of the New Haven division of the Connecticut Company, New Haven, Conn. This is in accordance with an announcement made by the company a month ago to the effect that one-man cars would be put on several lines, replacing two-man cars in the interest of economical operation. It is expected that in the fall the company will make additions to one-man-operated car service on other lines in the city where two men are now employed.

Increase Proposed on Philadelphia Suburban

The Philadelphia & West Chester Traction Company, which operates from 69th Street Terminal, Philadelphia, to Sharon Hill, Media, Ardmore and West Chester, has announced an increase in the passenger rate to a flat 10-cent fare effective July 20.

The company serves one of the most actively growing sections in the state. Its action eliminates the use of the 7½-cent ticket formerly sold in strips of four each for 30 cents and establishes the flat 10-cent rate for all zones where the ticket was used. Where formerly the cash fare was 8 cents it will now be 10 cents. An increase in fare from 69th Street Terminal to Seventh and Welsh Streets, Chester, from 19 to 22 cents is also announced.

School tickets, which, under the present rate, cost 7½ cents, will, under the new tariff, cost 10 cents each. An increase in the special car rates from $8 to $10 per car-hour is also announced. Special car rates for service between 1:30 a.m. and 4:30 a.m. are also increased, and there is an increase in minimum charge for special cars from $16 to $20.

Among the changes provided for in the tariff, which include the elimination of all tickets except the joint ticket from 69th Street Terminal to Chester and of school tickets, is also announced a change in the fare zones along the route to West Chester. Where formerly there were six fare zones to West Chester, making the total fare for a one way trip 45 cents, there will, under the new rate, be five zones at 10 cents per zone, making the total one way fare 50 cents. The through rate from Media to 69th Street is 15 cents for two zones, but the charge in each zone for intra-zone traffic will be 10 cents.

In a letter issued to patrons of the lines by A. Merritt Taylor, president of the company, the reasons for the step are explained. During the twelve months ended Dec. 21, 1926, the letter states, the income statement shows that the company earned $17,767 applicable to return on $798,000, actual cash investment in the Philadelphia & West Chester Traction Company's stock.

Reasons for the increase in fares are found in a paragraph which reads:

We had hoped that the rapid increase in traffic (due to the rapid growth of the communities served) would produce a large increase of earning with the present rate of fare, but this hope is not being realized, due largely to diversion of traffic by privately owned automobiles, motor buses and taxicabs on improved highways.

Since March 1, 1913, at which date practically all the company's lines were constructed, the unit fare has been increased from 5 to 8 cents, with four tickets for 30 cents. Average unit fare per passenger is now 7.55 cents, which represents an increase of only 51 per cent over the unit fare charged on March 1, 1913.

The letter to the patrons asks for their support and points out that in the year ended 1913, passenger revenue per car-mile was 29.84 cents, while this revenue in the year ended March 1, 1927, was 54.67 cents per car-mile, an increase of only 83 per cent. In the year ended 1913 the cost of operating one car 1 mile was 16.82 cents. This cost is now, according to the statement, 37.23 cents, or an increase of 121 per cent.

Wages Unchanged by New York State Railways

Negotiations for a new labor and wage contract, covering more than two months, between representatives of the New York State Railways and union officials of Rochester, Syracuse and Utica ended on June 30 with an agreement to continue the present contract.

This action affects 3,000 employees in the three cities, who sought originally a flat increase of 9 cents an hour and changes in working conditions. The present scale calls for 55 cents an hour for operators of two-man cars, 57 cents for interurban employees and 60 cents for one-man car operators.

The men twice in joint balloting in the three cities rejected the proposal to renew the contract. After prolonged bargaining the workers voted to empower their officers to make the settlement.

Railway officials pleaded that increasing cost of maintenance and operation precluded any wage advance. The vast improvement program in the three cities, mostly new paving, was cited as the principal reason for the inability to grant any advance this year.

The wage contract expired on May 1.

Terminable Permit Bill Not Reached in Florida

No action was taken by the Florida Legislature on the terminable permit bill, to which reference has been made before in the ELECTRIC RAILWAY JOURNAL. The Florida session is limited under the constitution to 60 days. At the recent meeting nearly 3,000 bills were introduced in both branches. It was impossible to read all these bills, much less act upon them. The sponsors of the permit bill feel that it would probably have passed had it been possible to reach it on the calendar, but a two-thirds vote of each branch of the Legislature was needed. That could not be mustered. It is intended to reintroduce the measure at the next session, in 1929.

Honor Mr. Senter at Dinner

A testimonial dinner in honor of Ralph T. Senter, president of the Philadelphia Rapid Transit Company, Philadelphia, Pa., is to be held on July 7 at the Ritz-Carlton, Philadelphia. Members of the dinner committee are Robert P. Hooper, Joseph A. Queeney, Andrew J. Carty, Ernest T. Trigg, Stotts J. Cotsworth, William I. Stanton, Benjamin A. Hageman, Jr., and Ellis Ames Ballard, chairman. Mr. Senter was recently made president of the Philadelphia Rapid Transit Company.

Grand Rapids Sees Rail Coach Christened "Lindy"

Thousands of Grand Rapids, Mich., residents gathered at Ramona Park on June 19 for the christening of an electric rail coach of the Grand Rapids Railway in honor of Col. Charles Lindbergh. Carl Batts, president of the Grand Rapids Flying Club, urged the crowd to dismiss fears of flying and to support the local airport. The coach was sponsored by the flying club.

Lee H. Bierce, secretary of the Association of Commerce, dedicated the coach. During the ceremony planes circled over the crowd while sixteen musicians of the Elks band in two air liners played "The Spirit of St. Louis." The program was broadcast.

The new car, which was built in the shops of the Grand Rapids Railway, was in keeping with the quality of the new rolling stock. The outside decorations included the name of Colonel Lindbergh and the flying insignia with the American shield and star signifying a senior aviator. Above the flier's name was a picture of his plane, the Spirit of St. Louis, while a crayon portrait was hung above the bulletin board inside. An airplane propeller, presented by the Stout Air Service, was placed on the front of the car.

Car operators were known as pilots and were dressed in the one-piece flying uniform with goggles and helmet. The car was placed in regular service on June 20.

New York Commission Considers Fare Pleas

The Public Service Commission, in session at Albany on June 29, granted a rehearing to the city of Buffalo on its order dated June 8 fixing rates of the International Railway in that city, but denied that part of the petition asking that the commission rescind the order fixing rates. There was no memorandum. The rehearing will be held at Buffalo July 13, 1927. Commissioner Lunn voted with Chairman Prendergast and Commissioners Van Namee and Brewster on that part of the order providing for a rehearing, but voted in the negative on the denial of the petition for a rescinding of the order of June 8.

The Public Service Commission denied the petition of the city of Albany for a rehearing. In the latter case the memorandum of Chairman Prendergast was approved by Commissioners Van Namee and Brewster, Commissioner Lunn voting in the negative but without submitting a memorandum.

Backing Up the Railway

Officials of the Lincoln Traction Company, Lincoln, Neb., have succeeded in interesting the business men of the city in its problem of how to keep on while gross receipts fail to meet bond interest. Several meetings have been held at which the sentiment was unanimous that the company should be favored whenever possible and nursed along so as to make it an asset rather than a liability. The sentiment was unanimous also that the company should be relieved of the occupation tax of 1 per cent of its gross earnings and that if the main thoroughfare is repaved as proposed it be relieved of any cost in connection with it. It proposes to run buses instead.

Amalgamated Meets in Birmingham in September

The twentieth convention of the Amalgamated Association of Street and Electric Railway Employees of America will convene this year on Sept. 12, in Birmingham, Ala. International President W. D. Mahon is hopeful that this will be the largest convention in the matter of attendance ever held within the association.

Resumption of Railway Service in Tampico Not Expected

The prospects of a resumption of railway service in Tampico, Mexico, a city of 80,000 inhabitants, appear remote at the present time, as the Tampico Electric Company has declined a continuance of the public service conducted at a great loss. In fact, the eventual retirement of all operations of the company at Tampico is envisaged if adverse conditions continue as in the past to make further operations unprofitable.

The railway service of the city was permanently discontinued on March 31, 1927. The action followed the failure of a series of conferences held by the Tampico Electric Company with the Union of the Street Car Workmen and the State Labor Board. For two days early in the month the service had been stopped, but the company resumed operations until the end of the month, pending further negotiations sought by the state and municipal authorities for the purpose of finding a working basis for the continuance of operations. As was noted in the ELECTRIC RAILWAY JOURNAL issue of April 9, the company will continue to operate the electric railway route which connects Tampico with the gulf coast, known as the "Miramar" route, a distance of 9.9 km. This line is not parallelled by a road and therefore does not suffer from the competition of jitney service.

According to recent information supplied by the Department of Commerce, under the terms of the agreement for suspension reached with Emilio Portes Gil, the Governor of the state, wages will be paid for 54 days to the 230 workmen who are necessarily laid off by the suspension of services.

The suburban development of the Tampico district has followed closely in the path of the electric lines, and the complete cessation of this service is proving a considerable hardship to the general public. The jitney service, supplied by low-priced American cars, is unsafe and unsatisfactory.

Franchise Talk Renewed in Omaha

Little headway has been made in the attempted negotiations between the Omaha & Council Bluffs Street Railway, Omaha, Neb., and the city over a new franchise. Fred P. Hamilton, president of the company, in an effort to get the matter lined up where a decision may be reached, has in effect informed the city that it is expected to choose between a suit being pressed in federal court to establish the company's claims to a perpetual franchise and submitting to the voters in the early fall the matter of a 30-year franchise.

City Attorney VanDusen will advise the Council that the choice as to what the next step shall be rests with the company. He says he cannot undertake to handle both the federal case and the franchise ordinance negotiations. He professes to prefer going ahead with the franchise case in court, believing that the city can win it. Councilmen insist on knowing whether the promise of the company that it will forego its claim to a perpetual franchise means a dismissal of the pending perpetual franchise case, begun by bondholders.

John L. Webster, attorney for the company, says so many matters must be taken into consideration that the subject is one for negotiations and not for instant decision.

"When You and I Were Young"

Twelve employees of the Boston Elevated Railway, Boston, Mass., who have been in the service of the company 50 years or more were entertained at luncheon by Edward Dana, the general manager, recently. As reminders of the occasion autographs of the men present were written on a sheet of the trustees' paper and a photograph was taken. After the repast there were comments and talks evocative of memories of Boston when these men were "tow boys."

FREIGHT SERVICE TO BE ABANDONED.—Announcement has been made by the Springfield Street Railway and the Worcester Consolidated Street Railway that their trolley freight service in Massachusetts will be discontinued on all lines on July 1.

TRAMWAY ROUTES IN BOOKLET.—All points of interest in Halifax, N. S., can be reached by the street cars. How to arrive at the Public Baths, the "Dingle" and Point Pleasant Park are graphically and colorfully told in a booklet issued under date of June by the Nova Scotia Tramways & Power Company, Ltd. Regular passengers and visitors in Halifax are also told about traffic observations, non-delay service and special stops.

ROUTE NUMBERS ON CARS.—The Springfield Street Railway, Springfield, Mass., has begun putting route numbers on the tops of its cars and by July 15 will have this work completed on all lines. The numbers are 10 in. high. They will be illuminated at night.

Recent Bus Developments

Bus Substitution Order Sustained

Order of the Department of Public Works of the State of Washington granting the application of the Pacific Northwest Traction Company for permission to substitute buses for part of its interurban service between Burlington and Bellingham, Wash., has been sustained by decision of Judge D. F. Wright of the Thurston County Superior Court, in the appeal and review taken by protestants. The applicants for writ of review were the Chambers of Commerce of Mount Vernon, Burlington, Anacortes and Sedro Woolley and the Chamber of Commerce of Skagit County and Board of County Commissioners. It was the plan of the Northwest Traction Company to alternate buses with interurban trains maintaining between the two the same schedule. It is expected the case will go to the Supreme Court of the state.

Another New York Company to Seek Bus Rights

Federal Judge Harry W. Goddard has signed an order authorizing N. A. Elsberg and Michel Kertland, receivers for the Eighth & Ninth Avenue Railway, New York, to join in an application for the substitution of buses on the company's lines. A petition is also to be sent to the Board of Estimate and Apportionment for a modification of the company's charter which will permit this substitution. Stockholders of the company favor the use of buses.

Expansion of Service Effective

The new combination bus-electric railway service between Milwaukee and Janesville will be 30 minutes faster than the present bus line. Direct bus service to Delavan, Elkhorn and East Troy, connecting bus service to Racine, Lake Geneva and Burlington and operation of parlor car motor vehicles on all these lines have been installed by the Wisconsin Motor Bus Lines and the Milwaukee Electric Railway & Light Company. The bus line service has been connected up with the new rapid transit railway line operating from Milwaukee to Burlington and East Troy.

St. Louis Is Catering to Opera Lovers

The St. Louis Bus Company, auxiliary of the United Railways, St. Louis, Mo., and the People's Motorbus Company have installed special bus service for the St. Louis Municipal opera season at the Municipal Theater in Forest Park, which opened on June 6 and which will continue for twelve weeks.

The St. Louis Bus Company is operating a special line along De Baliviere Avenue from Delmar Boulevard to the theater. The Olive-Delmar, Olive-University and Union Boulevard street car lines make connections with and furnish transfers to this bus line. At the close of the show the buses give transfers to the street cars.

The People's company is operating four direct lines to the theater and its schedules are so arranged that the buses will arrive at the theater at regular intervals each evening beginning at 7:15 p.m. A fleet of buses is also assembled to be ready at the close of the performances so there will be no delay in transporting patrons to their homes.

During its first week the opera played to 40,000 patrons and most of them were transported by the bus lines, as owners of automobiles have found parking within a convenient distance of the opera a big problem and have turned to the almost door-to-door service furnished by the St. Louis Bus Company in conjunction with the United Railways and also by the People's Motorbus Company.

Louisville Case Decided

Court Holds Franchise Necessary for Intracity Systems—Intercity Lines Exempt—Competition of Railway Restrained During Time Case Was Being Tried

BUSES cannot operate on the streets of Louisville, Ky., without a franchise, the Court of Appeals ruled on June 24 in affirming the decision of the Jefferson Circuit Court in the Louisville bus case.

The People's Transit Company sought to operate buses on Broadway in Louisville, contending it paid license and city taxes. The Louisville Railway contended that, according to the constitution, the transit company must obtain a franchise to operate its buses. The lower court upheld the railway and the Court of Appeals affirmed the decision.

The case does not involve the interurban carriers, the court ruled, saying:

> It requires no stretch of reasoning to apply that principle to an interurban carrier, using motor power and employing vehicles supported by rubber-tired wheels instead of iron wheels constructed to run on the rails of a fixed track. Since therefore, terminal cities and those traversed by an interurban carrier may not exact from them a franchise under Section 164 of the Constitution this alarm disappears.

When the case was pending in the Louisville Court, Robert L. Page, attorney for the Transit Company, said he would ask the Council for a franchise to operate buses in Louisville. This was considered the most important business that would come before the new Democratic Council.

Many Briefs Filed

Seven briefs were filed in the case involving the right of buses to operate on the streets of Louisville without a franchise. The railway and the transit company each filed three briefs, while the Consolidated Coach Corporation filed an *amicus curiæ* brief. The latter, while not litigants in the case, claimed it might have been affected by the intercity franchise question, as would all the bus lines run in the state.

The railway in its third brief sought to show that the question concerned only the operation of intracity buses and the intercity and intercounty buses would not have been affected by the decision.

It said the chief question was that the transit company could conduct a transportation system in Louisville without first acquiring a franchise to do so, and pointed out that under Section 164 of the State Constitution the right must grant them a franchise, which must be auctioned to the highest bidder.

Operation Halted by Injunction

The temporary injunction was granted and the bus company appealed the decision, pointing out that licenses could be obtained only for a year at a time and that a long-time franchise would not be in accordance with the existing one-year laws for the operation of buses.

The Court of Appeals declined to decide the case on temporary injunction proceedings, recommending that the case be remanded to the lower court for trial on its merits. In the meantime the injunction preventing the operation of the transit company buses was permitted to stand. The Appellate Court said that the case as it was then presented involved questions of far-reaching importance. It was shown that the counties and cities through which intercity buses operated might require franchises if the intercity companies were bound by franchise statutes.

The railway contended that the motor transportation act of 1926 governed the operation of intercity and intercounty bus lines and that intercity modes of transportation were affected by the franchise right. Its contention was that a decision in favor of the transit company would bring about an old transportation operation conducted by a new agency, outside of the uniform plan and regulation set out in the present constitution, while a decision in their favor would bring about the operation of a new transportation agency, the bus, under the uniform plan of regulation set out in the present constitution.

The court declined to decide whether the railway had a right to operate its

Digitized by Google

buses without a special franchise and, likewise, declined to decide if the operation of the railway buses were permissible under its general franchise.

Just what the next move will be is a matter of speculation. Attorneys Robert L. Page and Allen P. Dodd, for the Peoples Transit Company, say that a franchise will be drafted and offered before the City Council.

There has been talk to the effect that the Louisville Railway cannot bid on a competing form of service. However, the Kentucky Carriers, the bus subsidiary of the Louisville Railway, probably could not be barred from doing so, while there probably would not be anything to prevent individuals or firms from buying a franchise and later assigning or selling it.

G. B. Powell, Kentucky Carriers, remarked that there was nothing that he could say, as officials of the Kentucky Carriers and the Louisville Railway were waiting for the return of President James P. Barnes from the East. He did say, however, that he believed that during the next few weeks the local transportation problem would be well along toward settlement.

Allen P. Dodd, one of the attorneys for the Peoples Transit Company, is a factor to be reckoned with in the new Democratic control of city and county, seated on June 27, as a result of the Governor appointing the entire defeated Democratic ticket of 1925, to fill vacancies caused when the Court of Appeals declared vacant all offices filled in the 1925 election. Mr. Dodd led the fight which resulted in the ousting of the Republican control. He has just been named by Mayor O'Neal as a member of the Board of Safety. He is popular with the entire party, including the new Democratic Council.

Action Brought Against Railway

The Massachusetts Coach Company, Boston, Mass., operating bus lines in Boston, Quincy and Milton, has filed a bill in equity in the Suffolk County Superior Court to prevent the Eastern Massachusetts Street Railway from operating buses from the Milton-Quincy line to Quincy Square. It is alleged that the railway's license has not been approved in writing by the Mayor of Quincy. The bus company further states that it holds all the licenses necessary to operate the various lines in the Quincy section.

Substation Refused in Tarrytown

The Third Avenue Railway, New York, received on June 27 a setback to its plan to substitute buses for its trolley cars in Tarrytown, when the village trustees, in executive session, denied the application of the company. The railway had sought a 25-cent fare for a bus ride between Tarrytown and White Plains, in place of the 10-cent fare now charged on the trolley cars. Three petitions containing hundreds of signatures were sent to the board asking the request of the company be denied.

Substitution Sought by Binghamton Company

The Binghamton Railway, Binghamton, N. Y., through William M. Riley, receiver, has petitioned the Public Service Commission for approval of a declaration of abandonment of its lines known as the Rockbottom line and the Spring Forest line. At the same time the Binghamton Railway Bus Lines, Inc., asked for a certificate for the operation of bus lines on the routes of the railway sought to be abandoned. A public hearing will be held on the petition.

Appeal for Bus Lines in Birmingham

Citizens of Bessemer, South Park, Ensley and other suburban sections of Birmingham, Ala., are requesting the Birmingham Electric Company to install buses in a large section well populated in that district not now reached by railway lines. The company is now operating a number of buses in outlying districts unreached by its car lines. Birmingham has grown so rapidly in the last few years that the company has been unable to extend its railway to reach some of the new sections.

New Bus Service Started in Portland

The Portland Electric Power Company, Portland, Ore., recently announced a new Powell Valley bus line service, with a 10-cent cash fare. The present Powell Valley bus line will be discontinued and a new routing followed. Regular service will be maintained from 6 a.m. to 12:30 a.m.

Railway tickets of all classes will be honored on the new line, except school tickets, in lieu of the 10-cent cash fare, with a charge of 2 cents each for tickets so honored. School tickets will be honored for a full fare the same as on street cars. Transfers will be issued to the new line from street car and bus lines and a charge of 2 cents will be made for each transfer so issued except for transfers issued on school tickets, on which there will be no additional charge.

The railway fare in Portland is 8 cents, with tokens of six at 45 cents and 50 tickets for $3.65. School tickets are 25 for $1, with two weeks the minimum time in which the card of any one pupil will be honored at the ticket office. School ticket are honored on Sundays until 6 p.m. and during sessions of summer school.

Abandonment of the Brooklyn Street car line in Portland, Ore., because it does not pay and because the district will be served by the Powell Valley bus line, has been asked of the City Council by W. H. Lines, vice-president of the Portland Electric Power Company. The company plans to extend its bridge transfer cars from Grand Avenue at Lincoln Street to connect with the Powell Valley bus line. This change will take effect, if authority is granted, July 1, when the new bus line begins operation. Patronage on the Brooklyn line has been falling off steadily for several years, Mr. Lines said, and that the district can be taken care of by the extension of the bridge transfer line and the Powell Valley bus line.

Partial Substitution by Buses

Buses are replacing cars on the Palmer, Ware and Monson lines of the Springfield Street Railway, Springfield, Mass. Three motor coaches are being assigned to the district for regular use. Forest Lake is no longer on the regular route from Palmer to Ware, but will be covered by special service. The schedule will approximate that of the old service, except between Palmer and Ware hourly service will be given throughout the major part of each day, to conform to the Saturday afternoon and Sunday afternoon schedules previously maintained.

Bus Route Authorized

The Public Service Commission on June 23 granted the petition of the Capitol District Transportation Company, Inc., subsidiary of the United Traction Company, for the operation of a bus line between Rensselaer and Albany.

At the present time the company is operating buses in Rensselaer following abandonment of certain railway lines and proposes to operate the bus route granted in conjunction with its motor routes in Rensselaer providing three lines of traffic. A ten-minute schedule will be maintained on the Third Street line, a fifteen-minute schedule on the East Street line and a 30-minute schedule on the Riverside Avenue line, with shorter schedules during rush hours. Transfer privileges will be afforded to the lines of the United Traction Company.

PATRONS PETITION FOR BUSES.—Patrons have asked the Connecticut Company, Hartford, Conn., to substitute bus service for the trolleys on Vine Street. Property owners are urging the move to prevent widening the street, if possible, by the city.

BUS ROUTE PROPOSED. As soon as the middle bridge over the Menominee River is opened for two-way traffic the Menominee & Marinette Light & Traction Company, at the request of the City Council, will apply to the Railroad Commission for permission to run buses from Dunlap Square, in Marinette, to Electric Square, in Menominee.

WOULD RUN BUSES TO CONNECT WITH TRAIN SERVICE.—The Napa Valley Bus Company has applied to the California Railroad Commission for authority to issue and sell 500 shares of its capital stock, at $100 a share for the purpose of financing the operation of auto stage service between Calistoga and Vallejo. This service will be in connection with the train service of the San Francisco, Napa & Calistoga Railway.

Financial and Corporate

Interborough Reports for Eleven Months

For the eleven months ended May 31, 1927, the total revenue of the Interborough Rapid Transit Company, New York, from all sources was $58,139,317, an increase of $1,371,678 over the corresponding period of last year. Expenditures for operating and maintaining the property increased $2,192,089. Taxes payable to the city, state and the United States increased $157,315. Rentals and other income deductions decreased $105,448. The net result for the eleven months was a surplus of $1,365,652, a decrease of $872,279. The comparison with last year is influenced by the strike during last July, as well as the fact that in July of last year there was a lump sum payment of $770,000 on account of the new advertising contract, against which there was no similar payment this year. The net result for May, 1927, was a surplus of $412,477, an increase of $24,012 compared with May of last year.

$912,735,000 Value Placed on New York's Transit Lines

At the session on June 27 in the inquiry to develop a plan for transit unification in New York City Norman C. Hill, engineer accountant for the Transit Commission, said that he began last January to bring the valuation of New York tractions made in 1921 and 1922 down to date and that since that time there had been some 55 to 65 men employed on the work. As of June 30, 1926, the valuation placed on the Brooklyn-Manhattan Transit Corporation's investment in its system on the basis of original cost is $165,902,000. The valuation of the Brooklyn-Manhattan Transit, excluding surface lines and real estate not used for railroad purposes, was $118,260,000. The valuation of the Brooklyn-Manhattan Transit's investment on the same date in property recapturable by the city and on the basis of original cost was $63,602,000.

The commission's valuation of the Interborough's investment in subway lines under contracts 1, 2 and 3 is $166,910,000 as of June 30, 1926. The value of the Interborough's investment on the basis of cost in the elevated lines of the Manhattan Railway is $43,815,000. The Manhattan Railway's investment in the original elevated property was put at $71,419,000 as of the same date. The city's investment in the subway lines of the Interborough is $177,000,000 and in the subway lines of the New York Rapid Transit Company $167,686,000. The commission's valuation on the cost basis of all traction lines in New York City as of June 30, 1926, excluding the Hudson & Manhattan Railroad, and including the city's investment, was $912,735,000.

Samuel Untermyer, special counsel for the commission, said that he would combat the reproduction cost less depreciation theory of valuation. He then compared the reproduction cost less depreciation valuations by the companies in 1921 and 1922 with the cost figures for valuation by the city at the same time. On these different bases the company valuation of the B.-M. T. and Brooklyn City surface lines in 1920 was $193,883,895, against the city's original cost valuation of $74,895,573. The company valuation of the New York Rapid Transit Corporation was $176,150,041, against the city valuation of $104,945,114. The company valuation of the Interborough Rapid Transit Company's investment was $233,747,697, and the Transit Commission's valuation was $189,497,127. The latter figure is subject to a reduction of $11,000,000 for cost of reconditioning the property.

Equipment Trusts Sought by South Shore Line

Authority to issue $710,000 par value of equipment trust certificates is asked in a petition filed with the Illinois Commerce Commission and the Public Service Commission of Indiana by the Chicago, South Shore & South Bend Railroad. Proceeds from the sale of the certificates will be used to finance in part the purchase of twenty new passenger cars, locomotives, flat cars and other equipment. The certificates will mature serially in annual installments over a period of ten years and will bear interest ranging from 4½ to 5½ per cent.

Pittsburgh Does Well

Net Holds Up Despite Decrease of $113,998 in Gross Earnings—Personnel Sold on Idea That Good Feeling and Harmony Will Achieve Success

DURING nearly the entire year 1926 the coal mining industry in Pittsburgh, Pa., was at a standstill, and this subnormal condition had its effect on the earnings of the Pittsburgh Railways, which show a decline of $113,998 in passenger revenue. This result was very disappointing. On the other hand, railway operating revenue from other sources increased $27,532, and by close supervision, economies and competent labor a reduction of $137,344 was made in operating expenses, excluding taxes. Despite this decline in gross receipts, the company furnished to the people of the Pittsburgh territory 1,668,599 more car-miles and more than 26,000,000 more rides than in 1925, thereby bringing the average fare per ride to 5.37 cents. This compares with 6.73 cents in 1923 and 5.78 in 1925.

The company has been steadily making headway since it emerged from receivership three years ago. It is immeasurably better equipped today to render service than ever before in its history. It is apparent that adversity has taught the company many lessons, and with fresh spirit and high resolve it is moving forward, manned by men who are convinced of the value of service and sold on the proposition that good feeling and harmony within as well as outside their ranks will achieve success. The management feels confident that the year 1927 promises still finer results, toward attaining which it is sure the best efforts of every officer and man will be exerted.

A plan of readjustment of the capital structure of the railway is still undergoing careful study. The officers realize that it is desirable to bring into one consolidated company the ownership of all of the leased and operated properties and to simplify the present situation. This complex problem, rendered more difficult by the many individual security issues outstanding, presents a number of angles for solution. In the comparatively near future a plan is expected to be presented which the company, with the support of the security holders, will be capable of executing. Meantime the arrangement of continuing to pay interest on matured bonds of underlying companies, in which the holders of more than 91 per cent of such bonds are participating, remains operative.

Operations under the partnership agreement with the city of Pittsburgh and certain municipal units of Allegheny and Washington Counties were conducted throughout the year to the satisfaction of all partners. The representatives of the people and municipalities

SUMMARY OF INCOME AND PROFIT AND LOSS OF THE PITTSBURGH MOTOR COACH COMPANY FOR THE YEAR ENDED DEC. 31, 1926

Operating revenues		$301,521
Operating expenses:		
Maintenance of equipment	$60,516	
Traffic	1,570	
Transportation	132,311	
General administrative	11,181	
Other general	20,633	
Taxes	15,877	
Total		242,090
Net revenue from operations		$59,430
Non-operating revenue—interest and discount		1,419
Gross income		$60,850
Income charge—interest on unfunded debt		6,351
Net income before appropriation		$54,498
Appropriation for depreciation		37,405
Net income for the year		$17,093
Surplus, Jan. 1, 1926		3,028
Additions to surplus—miscellaneous (net)		729
Surplus, Dec. 31, 1926—per balance sheet		$20,851

STATISTICS OF THE PITTSBURGH RAILWAYS

Miles of road	329.56
Miles of track	590.77
Carhouses operated	20
Car shops	2
Trainmen's quarters and administration buildings	12
Passenger cars—motor	1,318
Passenger trailers—motorized	70
Passenger trailers—non-motorized	159
Miscellaneous Cars:	
Freight	9
Snow sweepers	39
Snow plow	1
Snow scrapers	16
Sand cars	28
Flat cars	83
Work cars	94
Total cars	1,817
Passengers carried (revenue)	267,721,759
Passengers carried (revenue, free transfer and free)	312,425,564
Passengers carried (revenue, free transfer, free and estimated extra rides on passes)	396,679,675
Car-miles operated (total)	41,357,208
Car-hours operated (total)	5,012,828
Passenger revenue per revenue car-mile (cents)	51.81
Average fare per revenue passenger (cents)	7.95
Average fare per passenger (revenue, free transfer and free) (cents)	6.81
Average fare per car ride (total passengers carried) (cents)	5.37

on the Traction Conference Board, created by the agreement, have exhibited a very friendly spirit and ably co-operated with the management to the end that Pittsburgh might be supplied with transportation adequate to meet its many requirements.

There were placed in operation 50 new trolley cars, bringing the total up to 378 new cars put into service since the railway came out of receivership in 1924. These new cars are of the low-floor, center-entrance type, much lighter than the cars of earlier design and more economical to operate. In addition, 30 double-end cars were remodeled for one-man or two-man operation, and the usefulness of much of the old equipment has been increased by motorizing certain of the trailers so that the combination of the motor car and the motorized trailer may be operated as one unit. The reconstruction program also resulted in the renewal of 33.69 miles of trackage on the system.

The first full calendar year of operation of the Pittsburgh Motor Coach Company, affiliated with the railway, resulted in a net income of $17,093 after providing for all charges, including depreciation. The base fare is 25 cents. Results, considering certain adverse operating conditions, were satisfactory. At the beginning of the year 22 coaches of various makes and types were owned. During the year nineteen coaches were purchased and seven were sold. The total number of coaches owned at the close of the year was 34, including eight double-deck coaches. The six coaches placed in operation on the Point Breeze route are the latest word in motor coach efficiency and comfort. The new models, called "parlor cars de luxe," are equipped with balloon tires and air-cushion individual seats, arranged two on one side of the coach and one on the other with an aisle between. The establishment of additional lines during 1927 is contemplated, and this is expected to add to the favorable position of the company and of the Pittsburgh Railways.

The management makes full acknowledgment of the part played by the employees in the work of the company.

SUMMARY OF INCOME OF THE PITTSBURGH RAILWAYS FOR THE YEAR ENDED DEC. 31, 1926

(Prepared in accordance with the terms of the agreement between the city of Pittsburgh, sundry other municipalities, the Philadelphia Company and the Pittsburgh Railways)

Gross revenue from street railway operations		$21,727,230
Operating Expenses:		
Maintenance of way and structures	$1,159,616	
Maintenance of equipment	1,273,771	
Traffic	157,523	
Power	1,991,606	
Transportation	7,414,621	
General	993,130	
Miscellaneous	1,665,961	
Depreciation	2,053,457	
Taxes	609,932	
Total		17,319,621
Net revenue from street railway operations		$4,407,608
Auxiliary Operations:		
Operating revenues	$161,129	
Operating expenses (including depreciation)	137,392	
Net revenue from auxiliary operations		23,737
Total net revenue from operations		$4,431,345
Non-Operating Revenues:		
Rental of real estate and buildings	$21,461	
Interest and discount	172,703	
Miscellaneous	4,188	
Total	$198,352	
Non-operating expenses	9,272	
Net revenue from other operations		189,079
Gross income		$4,620,425
Income Charges:		
Items under agreement:		
Return of 6 per cent on property valuation of $62,500,000	$3,750,000	
Return of 6 per cent on additional capital for new property	345,600	
Payments to county of Allegheny, city of Pittsburgh and other municipalities in lieu of licenses and paving assessments	414,604	
Amortization of debt discount and expense on additional capital	67,325	
Items not under agreement:		
Interest on judgments and settlements	382	
Rental of Seventeenth Street incline plane	7,155	
Total		$4,585,068
Net income for the year		$35,357

STATISTICS OF PITTSBURGH MOTOR COACH COMPANY

Garages operated	1
Routes operated	5
Route-miles operated (single way)	18.60
Coaches owned	34
Revenue coach-miles operated	752,497
Passengers carried	1,149,283
Passenger revenue per revenue coach-mile (cents)	39.78
Average fare per passenger (cents)	24.32

The officers say that the year's accomplishments were made possible largely through understanding and harmony with the employees. This was true of employees in every department. The statement of the management was to the effect that the co-operation of the employees had been of genuine, helpful sort. Among other things, the management pensioned 23 men during the year under the retirement plan.

Deficit in Toledo in May

Operations of the Community Traction Company, Toledo, in May resulted in a deficit of $25,010 and brought the net deficit in the stabilizing reserve to $1,002,954. Railway and coaches carried 3,931,601 revenue passengers, compared with 4,178,773 revenue passengers in the similar month last year. Total revenue in May was $294,256 and combined operating and maintenance expense was $220,447. Coaches handled 224,074 passengers with revenue of $20,905 and costs of $21,214.

Net Up in Dallas Despite Decrease in Gross

Net income of the Dallas Railway & Terminal Company, Dallas, Tex., for the year ended April 30, 1927, was $62,389 greater than for the similar period ended April 30, 1926. This showing was accomplished in the face of a drop of $58,339 in gross income. It was made possible through the reduction of operating expenses by $120,729. The gross income for the 1926-27 period was $3,396,559, compared with $3,454,898 for 1925-26. Operating expenses in 1926-27 were $2,591,743 and for 1925-26 they were $2,712,471. The number of passengers hauled decreased by 4,028,726. In 1925-26 the company carried 64,972,644 and in the year just closed 60,943,918. The city permits the company, according to the franchise, to earn a return of 7 per cent on a property valuation of $10,880,000.

Balance Lower on Detroit Municipal Property

For the year ended May 31, 1927, the railway operating revenue of the Department of Street Railways at Detroit, Mich., was $21,544,271, against $23,129,429 for the year ended May 31, 1926. The coach operating revenue was $2,880,899, against $1,272,736. Total revenue from all sources was $24,694,494, against $24,630,352 for the year ended May 31, 1926. Railway operating expenses were $16,227,860, against

Digitized by Google

$17,444,246 for the previous year. Coach operating expenses were $2,609,765 and $1,266,845. This gave a total operating expense of $18,837,625 and $18,711,092 for the 1927 and 1926 periods respectively. Net revenue from all sources was $5,856,869, against $5,919,260 for the year ended May 31, 1926.

After the consideration of total deductions the net income was $3,190,304 in the 1927 period, against $3,241,729 for the year ended May 31, 1927. The balance for the period was $590,076, against $572,639. The total number of railway passengers was 462,119,489, against 497,791,761. Total coach passengers numbered 36,080,696, against 16,963,104 in 1926.

Surplus Before Sinking Fund in Terre Haute

The Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute, Ind., finished the year 1926 with a deficit of $79,157. Freight earnings were $593,330, compared with $561,680 in 1925. For the year there was expended and charged to capital account $8,173 on owned lines and $273,861 on leased lines. The amount of $232,726 was deducted from net earnings for account of sinking funds, although the principal of the sinking fund of the Terre Haute, Indianapolis & Eastern Traction Company's first and refunding mortgage was not paid because money was needed for capital expenditures. On Dec. 31, 1926, the bonds held for sinking funds amounted to $1,359,109. These facts were contained in the annual report to the stockholders.

The report states that plans for the merger of the Terre Haute, Indianapolis & Eastern Traction Company and certain subsidiaries and the Central Indiana Power Company and its subsidiaries into the Indiana Electric Corporation are progressing in a satisfactory manner. Circular letters have been mailed to the stockholders and bondholders explaining the plan and requesting the deposit of their securities with certain banks and trust companies each represented by a committee. Depositors will receive negotiable depositary receipts. At the present time a substantial majority of these securities has been deposited and others are coming in from day to day.

During the year the company purchased nine buses for use in Terre Haute and two passenger cars were purchased and reconditioned.

Total track mileage was 430.87, comprising 383.59 interurban and 47.28 city lines. Total main line route mileage was 433.07.

Appended to the report are statistics and data of subsidiary companies.

12-Mile Pennsylvania Road Would Suspend

Owners of the Pennsylvania & Maryland Street Railway, Elk Lick, Pa., which property was acquired recently by the Penn Public Service Corporation, along with that of the Meyersdale Electric Light, Heat & Power Company, have applied to the Public Service Commission for permission to abandon the line between Meyersdale and Salisbury. A bus line has been established between Cumberland, Md., and Meyersdale, and as soon as the railway is abandoned the bus line operating between Johnstown, Somerset and Meyersdale will be extended to the Maryland state line, where connection will be made with through buses between Uniontown and Cumberland, Md., and points east and west. The company operates 12.5 miles of line.

INCOME ACCOUNT OF THE TERRE HAUTE, INDIANAPOLIS & EASTERN TRACTION COMPANY

Year ended Dec. 31, 1926

Gross earnings from operation		$5,611,653
Operating expenses		4,436,221
Net earnings		$1,175,432
Taxes		181,819
Earnings from operation, less operating expenses and taxes		$993,613

Maintenance of light and power	185,520	203,694
Total maintenance	$1,417,132	$1,330,070

* Denotes decrease.

MISCELLANEOUS STATISTICS

Year Ended Dec. 31, 1926

Passengers carried—Interurban lines	4,399,737
Passengers carried—City lines	20,308,132
Total passengers carried	24,707,869
Freight handled (tons)	163,024
Express handled (tons)	9,584
Car-miles operated—Interurban lines	6,452,906
Car-miles operated—City lines	3,807,196

Valuations in Colorado Increased

The Colorado tax commission has raised the valuation of public utilities $7,000,000. Although valuations on certain steam properties were doubled, the electric railways were not so affected. The old and new valuations on the latter properties follow:

	1926	1927
Denver & Intermountain	$527,860	$527,860
Denver Tramway Corporation	12,251,900	12,251,900
Trinidad Electric Transportation Railway & Gas	1,621,500	1,809,240

Record in 1926 a Good One

The Twin City Motor Bus Company, subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., headquarters St. Paul, which operates interurban buses, carried 5,114,834 passengers out of a total of 7,243,969 transported locally by buses in 1926, a report to the Minnesota Railroad and Warehouse Commission discloses. Its gross revenue was $1,204,851 out of a total of $1,277,733 reported by all local companies. Local mileage by all bus companies in the state was 5,579,021, of which 4,977,740 was reported for the 102 buses of the Twin City Motor Bus Company, with 2,450 seating capacity.

Road in Receivership Shows Slight Loss

The report of Franklin T. Miller, receiver of the Boston & Worcester Street Railway, Framingham, Mass., accepted by Judge Crosby of the Supreme Court, shows a deficit for the first three months of 1927, but there is a most encouraging feature in that the passenger receipts, which were $159,210 in January, February and March, 1926, increased to $164,485 in the corresponding months of 1927. Freight receipts for the first three months of 1927 were $41,959 and the income after deductions was $29,648. There has been a very general falling off in freight receipts from $87,635 the first three months of 1923 until the above figure of $41,959 has been reached. Mr. Miller's reports date from Feb. 11, 1925. Since that time the total income has been $1,932,707, and expenses $1,938,946.62, leaving a net loss of $92,623.

Payment on Account of Detroit United Bonds

A. L. Drum, receiver for the Detroit United Railway, Detroit, Mich., has notified holders of that company's first and collateral trust sinking fund five-year 6 per cent bonds that, pursuant to a court order, they will be entitled on and after July 1 to receive upon presentation of their bonds at the Central Union Trust Company, New York, a payment of 6 per cent on account of the principal of these bonds.

Legal Notes

CALIFORNIA—*Street Car Has Right of Way.*

A motorist must yield to street car's right of way, where a reasonably prudent man would foresee a collision. [Dawson vs. San Diego Elec. Ry., 255 Pac., 215.]

COLORADO—*Unsecured Creditors Cannot Receive Cash.*

Unsecured creditors were held not entitled to payment out of cash in hands of receiver, accumulated during a receivership by reason of failure to pay interest on secured indebtedness. The decision to this effect was made notwithstanding that under the plan of reorganization the bondholders agreed that the cash should go to new company as working capital, since it was in no event liable for payment of unsecured claims. Temmer vs. Denver Tramway Co., 18 Fed. (2 Series) 226.]

FLORIDA—*Issues Finding on Injuries Received by Conductor on Street Car.*

Where a declaration alleges a cause of action against a street railway for the wrongful death of one of its conductors caused by the negligence of the motorman, and the allegations do not show negligence of the deceased or that the decedent and the motorman were "jointly engaged in performing the act causing the injury," a demurrer to the declaration was properly overruled. [Tampa Elec. Co. vs. Jandreau, 112 So., 558.]

IOWA—*Rules When Employees' Associations May Contract on Necessary Number of Employees to Run Cars.*

A city has the right and power to designate whether street cars shall be operated by one or more men, but where the city has not exercised regulatory power reserved by franchise ordinance, the street railway and employees' association may contract respecting the number of men required to run cars. [Des Moines City Ry. vs. Amal Association of Street & Elec. Ry. Employees of America, Div. 441 of Des Moines, 213 N. W., 264.]

KANSAS—*Contributory Negligence of Motorist Charged.*

Automobile driver proceeding across a street car track without paying any attention to approaching street car, held guilty of contributory negligence barring recovery. [Gardner vs. Topeka Ry., 255 Pac., 83.]

MASSACHUSETTS—*Not Responsible for Ordinary Jolts and Jars of Street Car.*

Ordinary jolts and jerks of street cars in starting or stopping or in going around curves or over switches are usual incidents of travel, and for injuries resulting therefrom street railroad is not liable. But the sudden stopping of a street car approaching a stopping place with such jolt that it threw plaintiff, a strong, active woman, who had firm hold of iron railing, 5 or 6 ft. onto the floor, with such force as to break one of her bones, held to show negligence in management of car, authorizing recovery of damages. [Warren vs. Boston Elevated Ry., 155 N. E., 871.]

MINNESOTA—*A Passenger Was Injured Alighting From Car. Duties of Company and City Defined.*

Plaintiff, a passenger on a street car, in descending to the street, stepped on a bulge or bump two to five inches high on a creosote block paving which was covered with snow, and fell, receiving serious injuries. It was claimed the street railway company was negligent in failing to select a safe place for her to alight. Held, that it was the duty of the municipality to keep the streets in repair, and it, if anyone, should he held responsible for injuries resulting from street defects; that the defendant cannot efficiently operate its system and exercise the highest degree of care in minutely watching for trivial surface defects such as are incident to traffic and elements, and that defendant meets its full duty toward a passenger in protecting him against surface defects, particularly in a paved street, when it exercises reasonable care in selecting a fairly safe place for him to alight. [Reid vs. Min. St. Ry., 213 N. W., 43.]

MISSOURI—*"Res Ipsa Loquitur" Was Held Applicable.*

Where a passenger in an auto was injured by contact with an insulator at the end of a guy wire suspended over the street constituting an obstruction, the doctrine of *res ipsa loquitur* was held applicable when it was shown that the wire was in an abnormal position and where the person injured, by reason of unfamiliarity with instrumentalities employed by the defendant, can have no information as to the specific character of the negligent act or acts producing his injury. In such a case he need only show control of the instrumentality by the defendant and its usual movements, and it then becomes incumbent on the defendant to explain the casualty, if it can, so as to exclude the presumption of negligence on its part thus created. [Gibbon vs. Wells, 293 S. W., 89.]

NEW JERSEY. — *Pedestrian Reading Newspaper While Crossing Street Hit by Bus.*

A pedestrian who saw a bus about 150 to 200 ft. away when he started to cross the street, continued on, reading his newspaper, and had proceeded about 12 ft. and was near the center of the street when struck by the bus. He was held guilty of contributory negligence barring recovery regardless of the inquiry whether the driver of the bus was negligent, himself, in not observing him. [Petras vs. P. S. Trans. Co., 136 Atl., 189.]

NEW YORK—*Franchise Is Subject to People's Rights.*

The franchise of a street railway to use the city streets is subject to the rights of the public to construct sewers or make such other necessary public improvements, and the expense of protecting, shoring up and supporting the tracks during such work must be borne by the company. It may not impose the cost thereof on the city by simply disregarding notice requiring it to do such work; but the city may cause the work to be done at the company's expense. In this case, the sewer contractor, who performed such work when the company disregarded the notice, was entitled to recover the reasonable costs thereof from the company. [Necaro Co., Inc., vs. Eighth Ave. Ry., 221 N. Y. Supp., 276.]

OHIO—*Bus Service Should Be Adequate.*

In a proceeding before the Public Utility Commission for an extension of an existing bus route, where the evidence shows that the public affected by such proposed extension does not have adequate common carrier transportation service, and that the granting of such extension will serve the convenience and necessity of the general public and eliminate the inadequacy and inconvenience of such lack of service, it is error to deny such extension. The needs of the public are the primary consideration. [Warren-Salem Coach Line Co. vs. P. U. Comm. of Ohio, 156 N. E. 453.]

SOUTH CAROLINA—*Injury Could Be Avoided in Safe and Suitable Conveyance.*

In a suit for injuries to a passenger who tripped on a piece of molding or board in the aisle of a trolley car, the complaint alleging that the injuries complained of occurred as the result of an act of commission or omission of the servants of the defendant in failing to provide a safe and suitable conveyance was held sufficient. It was further held that the defendant, as a common carrier of passengers, is responsible in its duty to its passengers. [Derrick vs. Columbia Ry. Gas & Elec. Co., 137 S. E., 682.]

WASHINGTON—*Motorman Can Assume Passengers Will Exercise Care.*

A street car motorman has a right to assume that other travelers on the street will use ordinary care and may operate his car on this theory until he becomes aware, or should become aware, that the traveler is in danger, or is not using ordinary care. [Yenor vs. Spokane United Rys., 255 Pac., 947.]

WISCONSIN—*Passenger in Auto Held Not Negligent.*

One injured in a collision between a street car and an automobile in which she was riding as a passenger was held not contributorily negligent as a matter of law in not protesting or taking other measures to reduce the speed of the auto, so as to avoid getting on street car track in making turn, nor in failing to look for approaching street car operated at an excessive speed. [Temlicka vs. Mississippi Valley Public Service Co., 213 N. W., 666.]

Personal Items

William G. Gove Honored Again

In recognition of his continued progressiveness in the railway field, William G. Gove, superintendent of equipment of the Brooklyn-Manhattan Transit Lines, Brooklyn, N. Y., was elected president of the New York Electric Railway Association at its annual meeting at Bluff Point, Lake Champlain, on June 24. This is the second honor within a year conferred on the man who 25 years ago became connected with transit companies in Brooklyn. In November of last year he was elected president of the New York Railroad Club. The radical

W. G. Gove

changes in the character of the service rendered on the Brooklyn lines can be in large measures attributed to his ideas on standardization and reconstruction and to his genius as an organizer.

Before his affiliation with the Brooklyn lines Mr. Gove was with the Boston Elevated Railway, where he also showed his gift for designing equipment. At one time he served with the Cincinnati Street Railway.

Mr. Gove was born in Cincinnati on Feb. 24, 1874. He was educated in the Cincinnati schools and at the Cincinnati School of Technology. After leaving the university he began work in a civil engineer's office.

His record in association work, particularly his work in the interest of the American Electric Railway Association, is well known, he being a past-president of the Engineering Association.

A detailed biography of Mr. Gove with special emphasis on his accomplishments in the shops of the Brooklyn-Manhattan Transit Corporation was published in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 11, 1926.

Col. E. M. STAYTON, for six years city member of the Board of Control of the Kansas City Railways, Kansas City, Mo., was recently named Railways Commissioner of Kansas City and a member of the board of directors of the Kansas City Public Service Company by the Kansas City Council. The position of Railways Commissioner was created in the new franchise recently granted the company and carries duties similar to those exercised by the city member of the former Board of Control.

A. W. Thompson Elected to Another Board

Arthur W. Thompson has been elected a director of the Consolidated Gas, Electric Light & Power Company, Baltimore, and Sir Herbert Holt of Montreal, Canada, and Thomas Aitken of London have resigned from the directorate. Mr. Thompson is president of the United Gas Improvement Company, with headquarters in Philadelphia. His election does not indicate any affiliation between the local utility company and Mr. Thompson's other interests. He was formerly president of the Pittsburgh Railways.

Clinton D. Smith Goes to Cleveland

The Cleveland Railway, Cleveland, Ohio, instituted on July 1 a new department which is known as the department of personnel. Clinton D. Smith, formerly general manager of the Beaver Valley Traction Company, New Brighton, Pa., will be executive head of the department.

Mr. Smith was made general manager of the Beaver Valley Traction Company in 1923. During the time that he has been with that company he has brought the lines to the very front rank of the railway industry, having received favorable mention in the Charles A. Coffin Foundation Award in 1925. Previous to going to the Beaver Valley he was general superintendent of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio. Prior to that he was associated with the Public Service Railway of New Jersey in charge of the schedules and traffic. While on that property he pursued a special engineering course tending to fit him as a traffic expert. He left the New Jersey property in 1916 and accepted the Ohio position.

There will be centralized in this new department under Mr. Smith all activities of employees, inclusive of employment, safety, welfare, athletics, social, civic and educational programs. More or less work of the character mentioned has been carried on by the Cleveland Railway, but with the institution of this department the work will be intensified and enlarged in order that there may be more individual attention given to public and employee relationship. In its functioning the organization will represent equally the employees and management as toward the public and will hold as its ideal the close co-operation and intimate harmony between all of the groups. Active sales training of employees will be another consideration. In carrying this out the employee will be given detailed information of the operation of his particular road, together with such information as may be necessary concerning the transportation business as an industry.

Mr. Smith was born in Harrison, N. J. His early education was received in the public schools. Graduating from high school, he matriculated at the Worcester Polytechnic Institute, Worcester, Mass., in the department of electrical engineering and was graduated in 1912. His technical training included a study of transportation in all its phases.

He is president of the Beaver Falls Kiwanis Club, director of the Beaver Falls Chamber of Commerce, president

C. D. Smith

of the Beaver Valley Management Council and a member of the Ambridge Board of Trade, the Contact Club of the Philadelphia Company and various other local civic organizations.

R. E. Plimpton Chicago Editor

R. E. Plimpton, associate editor of *Bus Transportation*, a McGraw-Hill publication, will make his headquarters in Chicago instead of New York in the future. Mr. Plimpton has been with the magazine since its initial issue in 1922. During that time he has traveled extensively in the Middle West, so that he is personally acquainted with conditions in the bus operating field there. At Chicago he will be in closer contact than heretofore with the manufacturers of buses and equipment, in which field he has specialized.

Mr. Plimpton will continue as chairman of the operation and maintenance committee, Society of Automotive Engineers, which is now engaged in a survey of accounting procedure for motor vehicles in large-scale operation.

Merrill B. Knox, assistant editor of *Bus Transportation* with headquarters in Chicago and formerly on the staff of the ELECTRIC RAILWAY JOURNAL, has resigned to devote his time to research work for a syndicate which plans erection of bus terminals in important cities.

Manufactures and the Markets

$13,000,000 Will Be Spent by I. R. T. for Automatic Signals

The Interborough Rapid Transit Company, New York City, on June 28 accepted without further public hearings a decree from the Transit Commission ordering the installation of automatic stop signals on all local subway and "L" tracks by June 30, 1937, at a cost that will amount to approximately $13,000,000.

The acceptance was verbal and will be made formal within the next fortnight, according to Arthur G. Peacock of the Interborough.

The cost of the installation, according to the present schedule, will be $9,200,000 on the "L" lines and $3,600,000 on the subway lines, but officials of the transit company expect these figures will be increased. Preliminary work already has been done. Mr. Peacock said, but some adjustment is still to be made in the trackage.

At the Transit Commission's office it was indicated that the formal order of installation of the apparatus was sent to the Interborough offices June 29. The company will have fourteen days in which to affix its official "O. K."

The work will be performed over the entire period of ten years allowed under the order.

Cars of Louisville Railway Being Refurnished

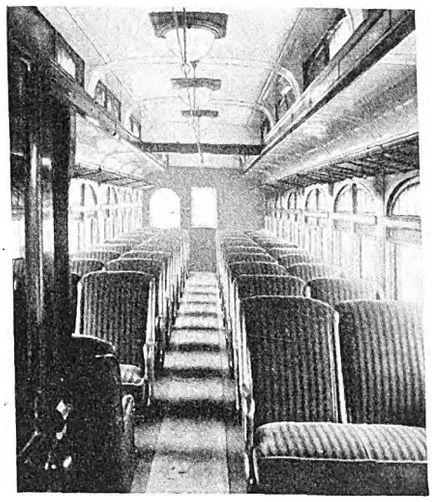
F. H. Miller, vice-president of the Louisville Railway, Louisville, Ky., in a recent interview, said that the company is confining its present activities largely to renewals and replacements. According to him the company is endeavoring to lighten the interior of its cars. The green ceilings have given way to white ceilings, which reflect light much better and make cars brighter and more attractive. Many cars finished in mahogany have been sanded down and revarnished to give the wood a lighter hue. There has also been a good deal of replacement of sun curtains with new ones of dark green, but of a better quality. Motors and other equipment have been overhauled in the company shops and materially improved.

Electric Hoist Manufacturers Against High Prices

An outstanding feature of the recent annual meeting of the Electric Hoist Manufacturers Association was the comment of the retiring chairman on the modern methods used by the association in developing new markets so as to produce larger volume and hence lower overhead costs, rather than restrict production in order to keep up prices. Discussion brought out the fact that domestic business for 1926 in the distribution of electric hoists was practically the same as for 1925, both in number of units and in the value of units, although there was a definite gain in export distribution. The engineering committee presented some very complete and interesting studies on the comparative specifications and details of all the various makes of ½-ton, 1-ton and 2-ton electric hoists.

It was announced that during the year a change was made in the method of reporting statistics so that the quantities are now segregated under standard rating sizes instead of in bulk, giving a better line on the trend of business in the different hoist capacities.

Rehabilitated Trail Cars for South Shore



Typical interior of rehabilitated trail cars, two of which the Chicago, South Shore & South Bend Railroad recently put back in service following their remodeling in the Michigan City shops of the company. The cars had been in service for eighteen years. They have been refurnished along lines closely resembling the company's new rolling stock purchased last July. Orange and maroon is the outside color scheme, while the former black interior finish has been replaced by a glossy walnut stain which blends effectively with the new floor covering of gray battleship linoleum.

Forty-eight Hale & Kilburn individual bucket type seats upholstered in brown and gray striped velour replace the old hard leather reversible type. Among other improvements are Pullman-type dome lights, cabinets for hot water heaters, new head and tail lights and the installation of a multiple-unit control apparatus in the vestibule of each car to permit its use as the head car in the train.

Although the cars have been eminently successful from an operating standpoint, the company will not overhaul any more vehicles of this type owing, it is understood, to the heavy expenses involved.

Preferred Dividend Resumed by Laconia Car Company

The Laconia Car Company, Boston, Mass., declared a dividend of $1.75 on the first preferred stock, payable July 1 to stock of record June 29. This marks the resumption of dividends which have been accumulating since July, 1924. The accumulation amounts to $21 a share.

L. R. Wilder Resigns as Head of American Brown Boveri

Laurence R. Wilder resigned the presidency of the American Brown Boveri Electric Corporation, effective July 1, at which time he became chairman of the advisory committee of the shipbuilding division of the corporation.

Maurice L. Sindeband, a vice-president, has been placed in charge of electrical operations, the corporation's most important business. Whether he will succeed Mr. Wilder as president has not been determined.

The corporation is the successor to the New York Shipbuilding Corporation, whose assets and business were acquired as an American affiliation of Brown, Boveri & Company, Ltd., of Switzerland. Coincident with this announcement, it is understood that the company's annual report is being sent to stockholders.

30 More White Buses for Cleveland Railway

An order for 30 White buses has been placed by the Cleveland Railway, Cleveland, Ohio, increasing the White bus fleet to 90, all in city service co-ordinated with street car operation. The Cleveland Railway also operates 44 White trucks. White buses, 60 of which have been in service, are standard equipment on the Cleveland Railway lines, with the exception of the Carnegie-Clifton Avenue route, on which double-deck coaches are used. The 30 new buses, all of 25-passenger capacity, White Model 50-B, are to be used principally for increasing schedules and extending service on existing routes, according to a program outlined by Joseph H. Alexander, president of the Cleveland Railway, and approved by the City Council.

R. T. Kent Named General Manager of Bridgeport Brass

The appointment of Robert Thurston Kent as general manager of the Bridgeport Brass Company, Bridgeport, Conn., has been announced by Carl F. Dietz, president of the company. Mr. Kent, has a national reputation as an industrial and technical expert. He has al-

Digitized by Google

ready assumed his new duties. He is a son of the original author of Kent's Mechanical Engineers' Handbook and was the editor and reviser of the tenth edition of that famous work. Mr. Kent's practical industrial experience began when, as a youth, he was an apprentice in a locomotive machine shop. He was graduated from Stevens Institute of Technology in 1902, and then went into industrial work, with interludes devoted to editing of technical publications and study of management methods.

Experts Studying Design of New Subway Units

WITH a view to obtaining a consensus of opinion by recognized experts in car design and construction, the Board of Transportation of New York City invited the assistance of an advisory committee consisting of James S. Doyle, superintendent of equipment of the Interborough Rapid Transit Company; W. G. Gove, superintendent of equipment for the B.-M.T. System· W. B. Potter, chief engineer of the railway department of the General Electric Company; A. E. Ostrander, assistant vice-president of the American Car & Foundry Company, and W. H. Mussey, mechanical engineer of the Pullman Car & Manufacturing Company. This committee held its first meeting on Thursday, June 23. It will work on the subject in collaboration with the engineers of the board's division of equipment and operation.

Some of the vital subjects which have been submitted for the consideration of the committee and which have already been studied intensively by the engineers of the Board of Transportation are length of cars, number and arrangement of seats, number and size of doors and their location.

The width of the new subway car was determined at 10 ft. at the time the subway structure and station platforms were designed. This is the same width as the cars now in use on the Brooklyn & Manhattan System. The height of the new cars will be approximately 12 ft., the same as now used by both the Interborough and B.-M. T.

The platforms of the stations on the city's new subway are 600 ft. in length. These will accommodate twelve cars of the Interborough type and nine cars of the B.-M.T. 67-ft. length. The platforms in the first subway were originally 200 ft. for local stations and 350 ft. for express stations. In 1908 the express platforms were lengthened to 480 ft. It has been planned for some time to make all Interborough Rapid Transit statins 480 ft., but the traction company has thus far succesfully avoided the disposition of the Transit Commission to have it done by the operating company.

The original platform length in the B.-M.T. subway was 480 ft. Others later installed were made 530 ft. and now the platforms at 40 stations are being lengthened to 530 ft., which will accommodate eight 67-ft. cars. The platforms of the city's new subway stations will thus have 12 per cent more capacity than the longest station platforms on the B.-M.T. system or 30 per cent greater than the seven-car trains now operating.

On the question of car length, the engineers of the Board of Transportation are anxious to arrive at a type of car which will provide a maximum number of seats per car, compatible with speedy loading and unloading, and at the same time be of such design and size as will fit the tubes of the existing I.R.T. and B.-M.T. systems with a view to ultimate unification with these systems.

On the question of arriving at a type of car which will dovetail with the existing city-owned but privately operated underground rapid transit structures, the engineers of the board have met with some obstacles which, while not insurmountable, nevertheless will necessitate alterations and changes in the Interborough subway structure.

The I.R.T. cars are 51 ft. long and 9 ft. wide. The overhang of the station platforms will have to be trimmed back if the platforms are some day to be used to accommodate cars of 10-ft. width. Some of the ducts that carry power and signal wires along the side of the structure will have to be reduced or moved back, signals will have to be reset and in some places cross-over switches, columns, trippers, etc., will have to be relocated.

Consideration has been given by the board's engineers to more than twenty different types or designs of cars. Lengths varying from 51 ft. to 137 ft. have been studied. Doors, singly and in combination, have been considered. Cars having from three to fourteen doors each from 2 to 4 ft. in width have been studied. Car types are largely affected by length of units, by seating capacity and door arrangements.

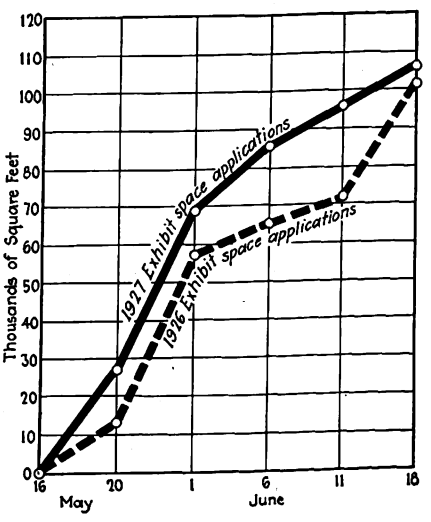
In this regard, surveys have been made during the past few months to determine the maximum dimensions of a car suitable for operation in the subways of the Interborough, which are of smaller dimensions than those of the B.-M. T. lines. These surveys indicate that it will be possible to operate a car 10 ft. wide through most of the I.R.T. subways with comparatively little reconstruction but that the length of the car must be about 54 ft. instead of 67 ft., the present B.-M. T. standard. It is probable, therefore, that the car for the new lines will be nearer the length of the I.R.T. cars but of the same width as the B.-M. T. cars.

One of the most serious objections to the 67-ft. car is the necessity for keeping the doors at the end of the car locked and thus preventing the movement of passengers from one car to another. The use of a shorter car will avoid this difficulty, and it is expected that the new cars, of whatever type selected, will permit free passageway between cars, thus affording passengers an opportunity to find seats in cars ahead or behind the car they enter.

One of the proposals under consideration by the engineers of the board is a car 54 ft. 6½ in. in length, 10 ft. wide, with three doors on each side and seating 52 persons. Such a car can be made up into a train of eleven cars, one more car than now in service on I.R.T. expresses, this train providing seats for 132 more passengers than the ten-car trains of the I.R.T.

Other considerations in 54-ft. car lengths embrace various seating arrangements, some for 56 seats and 60 seats, in the three-door type, 72 seats in a nine-door type, 48 seated in a five-door type and 86 seated in a fourteen-door type.

An A.E.R.A. Exhibit Story Without Words



At the Three-Quarter Post, and Still Going Strong!

This was the status of the A.E.R.A. exhibit committee when it met at Cleveland on June 22 to ratify space assignments amounting to

108,262 Sq.Ft.
to 226 Exhibitors

"An exhibit for every square foot" is the goal.
Sign that blank now, so you won't draw a blank at Cleveland Oct. 3-8.

B.-M. T. Wants New York City to Finance New Cars

The Brooklyn-Manhattan Transit Corporation on June 29 invited the city of New York to finance its equipment needs by issuing $9,700,000 of municipal bonds to be used in purchas-

Digitized by Google

ing the additional cars the company needs, these to be leased to it at an annual rental equal to the interest on the city bonds financing the purchase, plus the annual sum needed for sinking fund requirements.

The plan was announced by Gerhard M. Dahl, chairman of the board of directors of the B.-M. T., at a Transit Commission hearing this week.

Lead Market Active; Copper and Zinc Quiet

The non-ferrous metal market behaved just about as expected in the week ended June 29, with prices showing little change from a week ago. Lead was in excellent demand, particularly in the first half of the week, before successive price declines were cabled from London. Copper and zinc were in only moderate demand, and tin could hardly be called active. With the Independence Day holiday on Monday, and virtually all offices closed on Saturday, little activity is expected in the metal market until July 5.

Copper sales at the end of last week, and at the beginning of the week ended June 29, particularly on Thursday, were sufficient to absorb all the 12½-cent copper on the market, which was only a few thousand tons. Some of the larger producers, who had been holding at 12⅝ cents and above all along, were able to sell a little copper on Friday and Saturday at 12⅝ cents, but consumers showed little appetite at that level, and beginning with Monday the price slipped back to 12½ cents, at which several sellers would have been only too willing to book business yesterday and today.

Practically every seller did considerably better than an average week's business in lead; especially in the first half of the week ended June 29 was the market active. Prices were almost without exception 6.40 cents, New York basis, and 6.15 cents, St. Louis, though one lot of prompt lead went for 6⅜ cents June 28, and as high as 6.20 cents, St. Louis, was paid for September shipment. The American Smelting & Refining Company continued its contract price at 6.40 cents, New York. Most of the demand was for prompt and early July shipment.

One lot of zinc for prompt shipment sold as low as 6.15 cents on June 23, but other sales of larger tonnages were made on that day and the two succeeding days at 6.20 cents, St. Louis. A few cars of brass special were also sold at 6.25 cents. In the last three days the business has been pretty well split between 6.20 and 6.225 cents, with an occasional car going at 6.25 cents.

The premium on spot Straits tin, both over forward positions of Straits and over spot 99 per cent, is gradually being cut down. September Straits is now only about 2 cents per pound less than prompt and 99 per cent only 1½ cents less than Straits. The tin market has been rather quiet all week.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	June 28, 1927
Copper, electrolytic, cents per lb.	12.27
Copper wire, cents per lb.	14.50
Lead, cents per lb.	6.40
Zinc, cents per lb.	6.56
Tin, Straits, cents per lb.	66.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.42
Somerset mine run, Boston, net tons	1.85
Pittsburgh mine run, Pittsburgh, net tons	2.00
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons.	†
Kansas screenings, Kansas City, net tons	2.375
†Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.15–5.20
Weatherproof wire base, N.Y., cents per lb.	16.00
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.3
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.00
Turpentine (bbl. lots), N. Y., per gal.	$0.53

TRACK AND LINE

JANESVILLE TRACTION COMPANY, Janesville, Wis., has tentative plans under way to rebuild its track on South Main Street in Janesville. It has been decided to install new tracks at the Academy Street railroad crossing. Rebuilding of the track between Pleasant and Galena Streets, it is thought, will be completed this month.

UNITED RAILWAYS OF ST. LOUIS, MO., has started work on new street car tracks in Olive Street between Channing Avenue and Twelfth Boulevard. It will take four weeks to lay the double track line. There will be no interruption of railway service in the meantime as the old rails will remain in service.

DALLAS RAILWAY & TERMINAL COMPANY, Dallas, Tex., will extend its Lakewood Heights line from the present terminus at Tremont and Ridgeway to Paulus Street, on Paulus to Greenville Avenue and on Greenville Avenue to Llano. The improvement is estimated at more than $59,000, a requisition for which has been honored by the supervisor of public utilities.

SPRINGFIELD STREET RAILWAY, Springfield, Mass., has begun relaying its tracks between Benton Street and Pine Point, in State Street. Similar work soon will be commenced on the section of State Street between Oak and Hancock Streets; on Chestnut Street from the railroad underpass to Linden Street and on Carew Street between Main and Chestnut Streets.

MILWAUKEE RAILWAY & ELECTRIC LIGHT COMPANY, Milwaukee, Wis., has started work on extending two of its lines for a total distance of 1½ miles. The Third-Burnham line will be extended for ½ mile along National Avenue to 93d Avenue, where connection will be made with the Burlington-East Troy line, and an inclosed waiting shelter is to be erected. The name of the station has been changed from Fruitland to 93d Avenue Junction. Rapid transit suburban service will be extended from West Junction to 93d Avenue Junction, a distance of 1 mile.

TRADE NOTES

HYMAN-MICHAELS COMPANY, Chicago, Ill., has appointed the Hofius Steel & Equipment Company of Seattle its representative in Washington and the Northwestern territory.

MASSACHUSETTS MOHAIR PLUSH COMPANY announces the removal of its Boston office from 200 Devonshire Street to 80 Federal Street, 1129 Chamber of Commerce Building.

THE AMERICAN ELECTRIC SWITCH CORPORATION, Minerva, Ohio, with an authorized capitalization of $1,000,000, has been organized and incorporated with J. C. Lewis, president; Arthur Koch, treasurer, and E. F. Rinoehl, secretary. The corporation will manufacture a large and varied line of safety switches, fuse panels, panelboards, switchboards and distribution panelboards for use in industrial plants, etc. All mechanical parts as well as the boxes will be manufactured at Minerva. Sales policies and the sales representatives will be announced at a later date.

HASKELITE MANUFACTURING CORPORATION, Chicago, Ill., announces that the new car of the Grand Rapids Railway recently named after Colonel Lindbergh has Haskelite headlinings and interior linings. This is considered significant because all of the structural wood parts of the Lindbergh plane, the "Spirit of St. Louis," are of Haskelite material.

VALENTINE & COMPANY, New York, have arranged a permanent exhibit of the Nitro-Valspar jewel colors in their New York City office at 456 Fourth Avenue.

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, recently distributed a large folder descriptive of trolley gears, frog crossovers, etc.

WAGNER ELECTRIC CORPORATION, ST. LOUIS, MO., is issuing a new catalog, No. 144, describing the Fynn-Weichsel motor, the book is well illustrated with halftone cuts and chart.

CROUSE-HINDS COMPANY, Syracuse, N. Y., is presenting in a very attractive folder, No. 50, the new Obround conduit, Form 7. Orange and black is the color scheme of the new mailing piece.

HEMINGRAY GLASS COMPANY, Muncie, Ind., has issued a catalog describing its complete line of glass insulators, for telephone, telegraph, electric light and power distribution. The line described includes all standard telephone and telegraph insulators and power distribution insulators with voltages up to 11,000. The catalog is well illustrated.

ECONOMY ELECTRIC DEVICES COMPANY, Chicago, Ill., is sending out a two-page folder descriptive of its Economy meters, 746 of which were recently ordered by the Kansas City Public Service Company.

When the Boss Is Away—the Meetings Suffer

THIS is the open season for sectional association summer meetings. That is as it should be. It is a good thing for railway men to get together, compare notes, exchange experiences and get better acquainted. During the summer months it is a good thing for them to combine work and play. All work and no play dries up the individual—suppresses those human impulses toward social intercourse and good fellowship that round out the mind and furnish the inspiration for greater accomplishment. When the individual becomes so immersed in the day's routine as to lose his perspective, the greatest force for progress and improvement is stifled.

Association meetings afford the opportunity for stimulating enthusiasm and for generating new ideas. That is their primary purpose. Social contact, good fellowship and play are important, but they are secondary. They are merely means to an end and not the end itself. By helping to bring men closer together and to get them better acquainted, the entertainment phases of a meeting help to break down the walls of reticence and tend to stimulate that discussion and interchange of experience from which the real value of a meeting is derived.

Unfortunately, several recent sectional meetings give the impression that the means have become the end; that entertainment and play take precedence over the business sessions; that a few papers and a little perfunctory discussion are used merely as the excuse for attending such a meeting rather than as its primary purpose. Of course, this criticism does not apply to all sectional meetings. Many of them are characterized by active and spirited discussion and by a conscientious effort to make the most of the opportunity thus given for exchanging experience and gathering new ideas. But, unfortunately, the value of some meetings is open to serious question.

It is significant that those sections of the country in which railway properties have been particularly backward in meeting the requirements of present-day transportation conditions are those in which an association meeting is treated most perfunctorily—in which play rather than work seems to be the first thought of those few railway delegates who attend. It is significant also that the principal executives of the various properties are largely absent from some of these meetings. The railway delegates are almost lost among manufacturers' representatives, who make up a large part of the attendance.

Surely this matter needs immediate and serious attention. The electric railway industry can ill afford so to waste time and money. If ever an industry needed the opportunity for collective thinking, the comparison of experiences and the generation of fresh enthusiasm and new ideas, it is the local transportation industry. But when the chief executive and even most of his principal assistants are absent, it is not surprising that the meetings which are held become a mere social outing, from which little if any good is derived.

Chicago Has Only Itself to Blame

CHICAGO'S transit bills went down to defeat in the closing hours of the legislative session. Long before it became apparent that this would be their fate, the measures had been so emasculated by amendment that their value to the railways and the people of Chicago was largely destroyed. The fact that the bills became enmeshed in the general program of legislation was not conducive to their progress, but this alone would not have been fatal to them. They failed because they were not allowed to rise in conception above a legislative level obsessed with the idea that the measures, by their very source, must necessarily be prompted by selfish motives, and that they were primarily the personal concern of Samuel Insull and inimical to the public interest. This, of course, was untrue, just as it would be untrue that even if they had been Mr. Insull's bills, as the saying went, that would make them measures to be suspected.

There is no one who would deny that unified and improved local transportation and rapid transit are needed and wanted by Chicago. Yet the bills providing these things died in discussion. It all seems absurd, and it was absurd, particularly as the most violent critics of the bills have in the past sharply arraigned the officers of the transportation companies, including Mr. Insull himself, for not getting together on a unification and development program. It was true that Mr. Insull had been a factor in producing the agreement on unification and on a development program. He participated in the drafting of the bills only in response to urging that he could be helpful on a job that was vital to the well-being of Chicago. The bills themselves were worked out by competent lawyers impersonally, with their base resting on principles that have been under discussion for years.

The indeterminate permit bill more particularly was subject to criticism. This principle has been under discussion in Illinois for years. The results of operation under the indeterminate permit in every state in the Union where it has been tried, as well as in Europe, were studied by a joint committee of the Illinois Legislature, and that committee approved the idea for Illinois. The consolidation bill was drawn to assure legal unification of the transportation facilities. There was nothing inherently wrong in it. It was reasonable to assume that the City Council would make no grant to a consolidated company that was not satisfactory both to the Council and to the people, who have the final say in a referendum.

Any one who considers the matter carefully must subscribe to the view that, taken as a whole, the criticism current during the discussion of the bills was not con-

Digitized by Google

cerned with constructive comment on the fundamentals of the measures. That criticism sought rather to becloud and befog, by insinuation and innuendo, if not downright falsehood. Certainly, unification was provided for by the measures, and a development program advanced that gave every promise of working. The bills were primarily the concern of all who want better local transportation and rapid transit, and of the public officials who control the ways and means of permitting it to be provided. Not because Mr. Insull said so, but because it is a fact, responsibility for the loss of the legislation rests with opposition from agencies, journalistic and otherwise, that presumed to reflect public opinion.

An Argument That Is Irrefutable

MATERIAL of interest to the entire street railway industry is contained in an unusual advertisement which the Georgia Power Company addressed "To the Honorable William Randolph Hearst" and published recently in full-page size in the three Atlanta daily newspapers on the occasion of a visit to that city by Mr. Hearst.

A few years ago Mr. Hearst's Atlanta newspaper was actively "crusading" against the street railway, and the company knew that his presence in the city would recall vividly to the memory of the local people those days of strife and turmoil. Conditions are different now. Relations with all the newspapers are friendly and the railway enjoys the good will of its patrons to a high degree. Sizing up the situation, the company saw in the visit of Mr. Hearst an opportunity to drive home to the public the contrast between those days and the present, and did it effectively in the page advertisement. In its timeliness, in the advertising enterprise it displayed and in the remarkable candor with which it discussed the company's affairs, the advertisement itself was unusual. But its interest for the industry is in the story it contained of the company's progress and the means by which it has won the friendship of its public, including even that of the Hearst paper.

The Georgia Power Company has been doing unusual things in recent years. It has set out to win public cooperation and support by deserving it, by modernizing its equipment, by improving its service in every possible way, and it has made a success of it. In its effort to put a losing property back on its feet, the company made "First of All—Good Service" its policy, and it has demonstrated that good service is good business.

By reason of the heartening message it contains for those who may be discouraged or still in doubt as to the future of the street railway business, the power company's advertisement places the industry in debt to its framers. Let the reader judge for himself. The power company said:

> The first thing we did was to stop complaining to the public. Then we set out to give Atlanta the best street car service in the nation. We bought 203 new street cars, more new street cars than any other city Atlanta's size has got during this period. We brought our trackwork to a higher state of repair than it has ever been, installed automatic electric switches and made numerous other track improvements. We cut out interruptions in the service which were causing a great many complaints. Last year our cars traveled more than 26,000 miles per car—farther than the distance around the earth—before they had to be sent to the shops for repairs. Last year we went 348 days without an interruption to the service caused by failure of the power supply.
>
> Of course, it has taken a tremendous lot of money to make these improvements and we haven't spent it for any altruistic reasons. We have done it because we know it is good business to do it, and the fact that we have proved it's good business is a thing which will interest you most.

The ad then informed Mr. Hearst that millions of dollars had been poured into a losing property because the company knew that the first step toward putting the service back on its feet was to give citizens of Atlanta a service they would like to patronize and support. In other words, the power company never lost confidence in the soundness of that policy. It never lost confidence in the soundness of the railway industry and in the fairness of the public, even though results were slow in coming. This was included as part of its statement of policy.

Continuing, we read:

> The curve of earnings had been dropping steadily, until, in 1925, it was only slightly more than 1 per cent on an investment of about $20,000,000. But, in 1926, it started upward again. It was just a slight upturn, only a slight reduction in our annual loss, but that first upturn was all the proof we wanted that this policy pays. There should be a message of encouragement in that for other businesses, especially the other street railway companies.

This is indeed a message of encouragement for every electric railway property in the country. It is irrefutable that as ye sow, so shall ye reap. The answer of the company voices that indomitable sentiment that if entertained by the electric railway industry will forever silence the prediction that it is doomed. The Georgia company's stand in this matter reveals sporting blood of the highest order—sporting blood mixed with sound financial judgment and far-visioned engineering skill.

This kind of thinking was backed to the hilt in the Journal of June 4 by the head of one of the largest operating companies in New England. The statement in mind is that made by E. J. Dickson, vice-president of the United Electric Railways, Providence, R. I., who, after effectively presenting the rehabilitation of the company's rolling stock, said:

> Referring to the question as to results that can be attributed directly to better appearing cars with greater conveniences and comforts, I do not hesitate to state that notwithstanding all the other agencies employed to attract patronage, it is my firm conviction that had not the United Electric Railways undertaken the purchase of new cars, improved the appearance and convenience of others, and strengthened its track facilities, the gross earnings of the company would by no means be where they are today.

The gentleman from Rhode Island seconds the motion of the gentleman from Georgia. Each property in the industry must vote for itself. But in that vote lies its salvation or its doom.

Standardization of Traffic Regulations Advanced

ONCE more Herbert Hoover, Secretary of Commerce, has been instrumental in advancing the cause of standardization. This time reduction in the great variety of traffic regulations in effect in different American cities is the aim. On June 6 a meeting was held at Detroit attended by representatives of all classes of highway users as well as enforcement officials. Its object was to lay the foundation for a model for municipal traffic control. An account of the meeting appears elsewhere in this issue.

The need for some standardization of traffic regulations is obvious to any one who has traveled beyond the limits of his own home town. The old legal axiom that ignorance of the law is no excuse fails entirely to solve the problem of violation of traffic rules. As Grover Cleveland once said, "It is a condition and not a theory that confronts us." Regardless of the legal side of the question, it is a practical impossibility to expect the drivers of all vehicles to familiarize themselves in ad-

Digitized by Google

vance with the traffic regulations in towns other than their own through which they may be driving. Better results undoubtedly can be obtained by standardizing traffic rules to the greatest possible extent. Just how far it is feasible to carry this process is the question which the conference organized at Detroit will try to answer.

Active work toward the preparation of the model code for traffic control will be carried on during the summer by six committees. These committees will consider regulations for vehicles, pedestrians, street cars, and buses, and emergency vehicles as well as traffic signs and markings, parking, street obstructions, and enforcement. Each committee will draft a section of the code pertaining to the specific subjects under its consideration. After this has been done the committee chairmen will meet and consolidate their reports. A general report will then be published in tentative form for discussion by all interested parties. The presence of a number of prominent electric railway men on the various committees insures that the interests of the industry will receive due consideration in the working out of a solution of this important problem.

The Passing of Three-Phase Traction

WITH the inauguration of service on the new single-phase electrified system of the Great Northern Railway between Skykomish, Wash., and the Cascade Tunnel the only installation of three-phase railway electrification on the American continent was abandoned. In Italy, where the three-phase system has probably reached its highest development, the engineers are turning to high-tension direct current, and it is understood there will be no further extensions of the three-phase system.

The use of three-phase alternating current for the purpose was advocated many years ago as the ideal system for hauling heavy trains. The three-phase induction motor has characteristics quite different from those of the direct-current series motor, and for haulage of heavy freight trains over heavy mountain grades it was considered ideal.

Development of the single-phase system, with the possibility of employing induction motors if desired through the use of a phase converter, or any of the various types of single-phase commutator motors, or even the use of direct-current series motors through the medium of a motor-generator set as in some of the most recent locomotives, including the ones for the Great Northern Railway, has robbed the three-phase system of its great appeal. On the other hand, direct-current equipment has been very much improved, so that now much higher contact line voltages can be used than were feasible when the three-phase system was brought out.

Contrasted with its advantages, the three-phase system has the great drawback that two trolley wires are needed. These are at widely separated potentials, so that insulation is difficult to provide and to maintain. The complication is always present, but is greater the more complicated the track layout. On this account it has never been considered practicable to go to voltages that are common with single phase. In fact, direct-current contact lines can be built with comparative ease for voltages fully as high as those used with the three-phase system.

Elimination of the three-phase system can be looked on as another milestone on the road of progress in railroad electrification. Whether it will be possible to go still further and adopt a single system, few will regret the passing of three phase with all its complications.

Banker Stresses Need for Greater Corporate Publicity

COMING months after the suggestions of Prof. William Z. Ripley regarding the need for greater publicity with respect to corporation affairs, similar suggestions made by Thomas W. Lamont of J. P. Morgan & Company have caused hardly a ripple of comment in the daily press or among business executives. It is true that Mr. Lamont's remarks lack the colorfulness of the statements made by Mr. Ripley, but they are no less pronounced on that account. He points out the benefits which have accrued to the railroads, to such companies as the United States Steel Corporation and the General Motors Corporation, to banks and to the New York Stock Exchange from the making of periodic reports to stockholders and the general public. His article, contributed to *Industrial Management,* is a plea for still further extension of the practice of corporation publicity.

One point which he makes is of great interest to the electric railways. He says that full corporate publicity has helped enormously to build up the country's transportation system, and has distinctly enhanced the credit of the railroads and their ability to borrow money more cheaply. This is indeed significant comment. In referring more particularly to the General Motors Coroporation, he asks whether it can be a mere coincidence that the company has increased its lead over most of its competitors. He probably picked this company because it is so much in the public eye, but its methods of frankness about its affairs are not very different from those of some other manufacturers and of many public utilities. He sees as a great asset to the company the 60,000 investors who own its shares, purchase its motor cars, and tell their friends of the pride they have in being stockholders of this enlightened company and of the satisfaction they derive from the possession of its product.

In his discussion of the Steel Corporation, Mr. Lamont said that there is small chance for the so-called insider to profit by purchase or sale of its shares, based on advance knowledge of unusual gains or recessions in its business, because the company's month-to-month record of unfilled orders is open for the world to see. Now that these statements have come to be taken for granted their full significance to the investor, the economist, the employee and others is often overlooked. The recital of these cases calls to mind a somewhat similar incident in which only during the last week one of the largest makers of railway and other equipment took its stockholders and the public into its confidence with respect to the affairs of the company and the prospects for the future to an extent that would have been thought almost suicidal as recently as five years ago.

Frankness about electric railway affairs has certainly made strides in recent years, but there is still a great deal that can be done. Especially is it worth while for electric railway men everywhere to take to heart the significance of Mr. Lamont's remarks to the effect that study by the organization rank and file of frequently published figures gives the staff members a new and enlightened conception of their corporate employer's part and accomplishments, and stimulates in them new ambition and determination. It certainly does no good to blink at facts. Eventually they must be faced. And one of the best ways to do it is through enlightened public opinion.

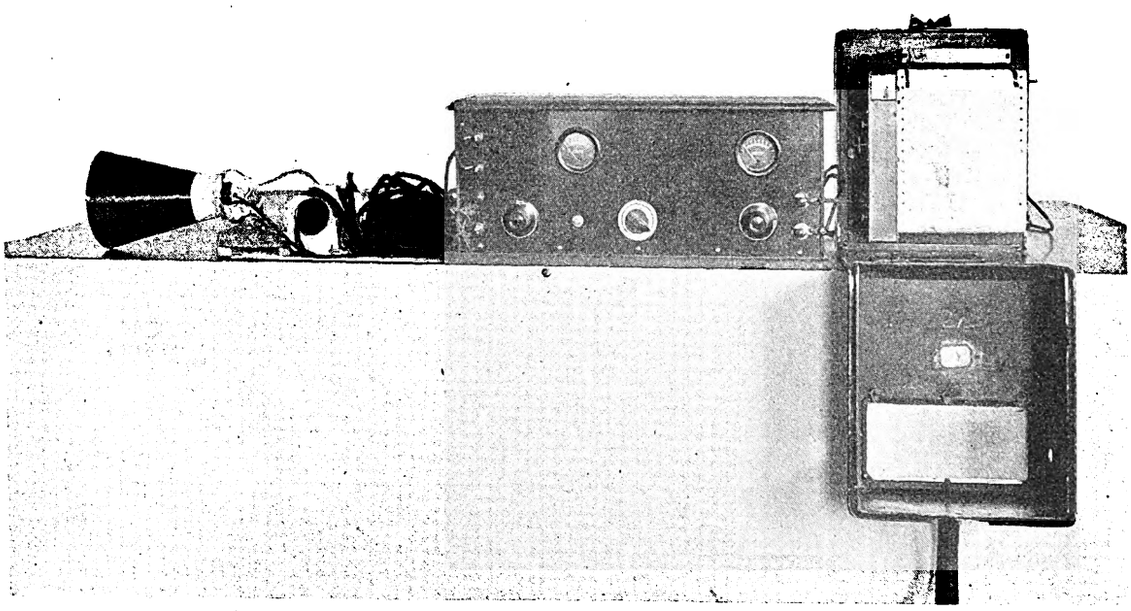


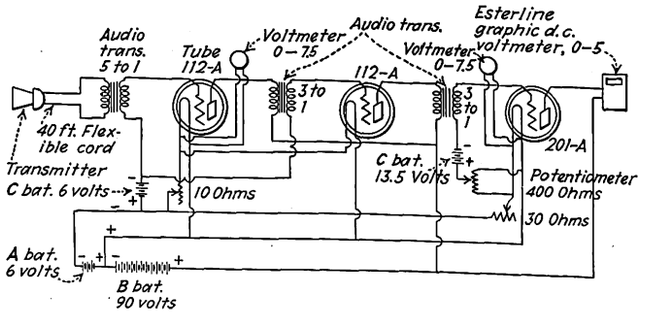
Graphic voltmeter and radio apparatus used in making n oise measurements

Measuring Noise of Passing Cars

By D. D. Ewing
Professor of Electric Railway Engineering
Purdue University, Lafayette, Ind.

NOISE minimization has become an increasingly important problem in the transportation field within recent years and with the advent of radio apparatus considerable progress has been made in developing practical noise measuring equipment and technical procedure. Communication companies have been using noise measuring apparatus for a number of years in connection with their transmission studies and more recently the automotive industry has been interested in vibration and noise measurement. In the railway field the noise committee of the A.E.R.E.A. has been doing pioneer work during the last two years.

Its reports at the 1925 and 1926 conventions contain valuable analyses of the noise problem as it affects the electric railway industry. The 1926 report of this committee also described a noise measuring device of the indicating type. An interesting article by Prof. J. T. Rood and K. E. Wooldridge, published in ELECTRIC RAILWAY JOURNAL Sept. 11, 1926, page 413, describes a somewhat similar measuring instrument. This device, however, differs from that of the A.E.R.E.A. committee in that it is provided with a hand-operated graphic recording attachment. Their article also contains some valuable noise test data. It is the purpose of the present article to present a brief outline of an automatic recording device and a discussion of test data taken in connection with a recent study of railway track noise.



Electrical circuits of the amplifying and rectifying equipment

NATURE OF "NOISE" ANALYZED

For the purpose of the present discussion "noise" may be defined as disagreeable sound. The mechanics of sound have long been well understood. Any mechanical action which sets up vibrations in the air whose frequency or pitch is within the audible range produces an action on the ear mechanism which the auditory nerves interpret as sound. As the ear does not interpret vibrations of all pitches and magnitudes with equal sensitivity a distinction may be made between sound as a series of vibrations set up by some mechanical agent and sound as an interpretation of these vibrations by the human ear.

The cause of the noise, or sound, sets up vibrations in the air which radiate in all directions. These vibrations may be of many different frequencies. An ear located close to the cause may hear only the

Fig. B

Fig. A.—Vibration tests at 9610 Quincy Street, Cleveland. Test C-24 was made with the transmitter 3 ft. from the gage line of one of the inbound track rails and C-25 3 ft. from an outbound track rail. All of the paving was of grouted granite block. One track was on International steel ties and the other was on wooden ties. The car speeds were about 26 m.p.h. in each case. The instrument calibration for these tests was not the same as those in which the loud speaker receiving unit was used.

Fig. B.—Typical noise graphs taken at the same location as in Fig. A. In C-12 the horn was 3 ft. from an inbound rail and in C-13 3 ft. from an outbound rail. The car speeds in each case were about 23 m.p.h.

direct vibrations, while one located at some distance may hear direct vibrations, weakened, of course, by transmission through the distance, and also reflected vibrations. It may easily happen that the amplification of the original sound by the vibrations which are reflected from neighboring surfaces may result in a sound which to the ear is of greater magnitude than that produced by the direct vibrations.

Any study of street noises should take into consideration this matter of reflected vibrations. Paving, building walls, etc., all may act as sound reflectors. An ear located at the sidewalk line will receive both the direct vibrations from the cause of the noise and the reflected vibrations which come from near-by surfaces.

The magnitude of the reflected noise will depend largely on the character of the reflecting surfaces. Smooth, hard surfaces are good reflectors, while rough, plastic surfaces are not. These differences are well illustrated by data which will be presented later in this article.

Instruments Used for Measuring Noise

In measuring the "noise" in these tests an input device in the form of a permanent magnet type radio loud speaker was used, a short megaphone being substituted for the horn. Weak alternating currents generated in the loud speaker mechanism by sound waves impinging on the diaphragm of the loud speaker were amplified by vacuum tubes, then rectified and recorded on an Esterline graphic recording direct-current voltmeter. The record strip is divided into ten major divisions and each major division into five subdivisions, or 50 subdivisions in all. As there is no established unit by which noise may be measured, the full chart width has arbitrarily been assigned the value of 100, or two units of noise per subdivision.

It is not claimed that this device interprets sound waves in the same manner as does the human ear, but it does give comparative values; thus when all is quiet the instrument reads zero, and the louder the noise as interpreted by the ear the higher will be the instrument reading.

While some percentage comparisons are given in subsequent paragraphs, it should be remembered that the calibration of the instrument does not follow a straight line law for all frequencies of vibration, being more sensitive for low volume low pitch noise than for high volume low pitch noise. For the frequencies to which the ear is most sensitive, however, the calibration more nearly follows the straight line law. In any event the deviations from straight line calibration are such as to cause the comparative percentages to be conservative rather than otherwise.

For measuring transmitted vibration, the same apparatus was used except that an ordinary telephone trans-

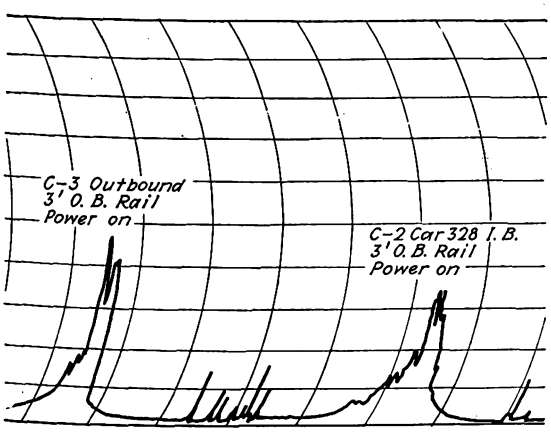

Fig. C

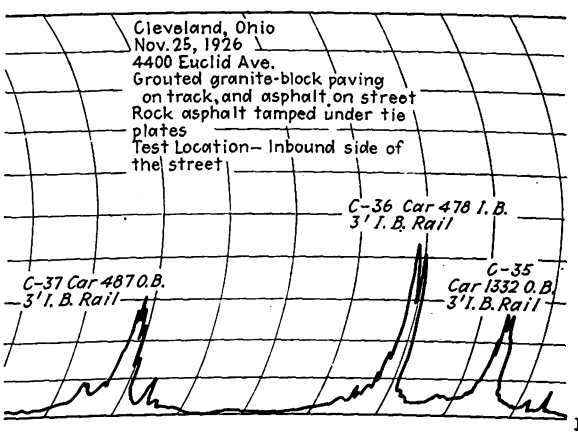

Fig. D

Fig. C.—These graphs, taken at the same location as in Fig. A and for similar cars, compare noise as measured at 3-ft. distance with that as measured across the dummy track, or 13-ft. distance. The car speeds in each instance were approximately 22 m.p.h.

Fig. D.—At 4400 Euclid Avenue, Cleveland, tests were made to compare the noise as measured at 3-ft. distance rail with that as measured across the dummy track, or at 13-ft. distance. The track centers are paved with grouted granite blocks and the street sides with asphalt. The car speeds were about 22 m.p.h.

Digitized by Google

mitter of the solid back, carbon granule type was used as an input device, the mouthpiece being turned down to rest on the paving. By placing the transmitter on the paving with the mouthpiece directed downward most of the direct noise was excluded and the instrument response was caused by paving vibration.

Perhaps it should be pointed out that the graphs of vibration and noise do not show the individual vibrations. The line drawn by the pen of the voltmeter simply indicates a measure of the magnitude or intensity of the vibrations.

In making the measurements the amplifier and voltmeter equipment were set up in an automobile, the automobile battery being used as a source of energy for the vacuum tube filaments. With the automobile parked at the street curb, a 40-ft. length of flexible cord permitted the loud speaker unit to be placed either near the track or at some other point on the street as might be desired.

Owing to the greater noise produced by the car trucks, peaks were often produced in the noise graphs. By knowing the chart speed, which was 1 in. in nine seconds, and the distance between car trucks a fairly accurate determination of car speed was possible in many instances.

TABLE II—COMPARISON OF NOISE AS MEASURED AT 13 FT. (3 FT PLUS DISTANCE BETWEEN TRACK CENTERS) COMPARED WITH THAT AT 3 FT.

Town	Paving: Track	Paving: Street	Noise in Per Cent of that at 3 Ft.
Cleveland	Granite block	Granite block	76
Cleveland	Granite block	Asphalt	70
Cleveland	*Open track		19
Schenectady	Granite block	Asphalt	67
Harrisburg	Asphalt	Asphalt	56
Harrisburg	Concrete	Concrete	92

*NOTE—The distance between track centers here was about 15 ft. instead of 10 ft.

during the latter part of last November. Noise readings were taken at ten different locations and a total of 240 graphs were recorded. The cars were operating on their regular schedules and all conditions were those of normal operations.

It is not possible, of course, to present all of the graphs, but a few are reproduced here, together with explanatory notes relating to them.

The noise readings at 9610 Quincy Street, Cleveland, are probably higher than they would have been had the street surface and rails been free from loose dirt and sand. At this location wooden ties are under one track and International steel ties under the other. The graphs of Figs. A and B indicate that tie type does not appreciably affect the volume of noise caused by dry car operation. This conclusion was verified at several other locations when tests were made.

The assumption is often made that open track is quiet track, but it appears from Fig. E that this assumption needs some modification. To an ear placed close to the rails it appears that this type of track is as noisy as any other. However, the graph also shows that at a short distance away the noise is small in volume. This is because of the excellent deadening qualities of dirt and ballast. The apparent quietness results from the low reflection coefficients and high absorptive values of dirt and gravel. Also, it may be noted that the wheel im-

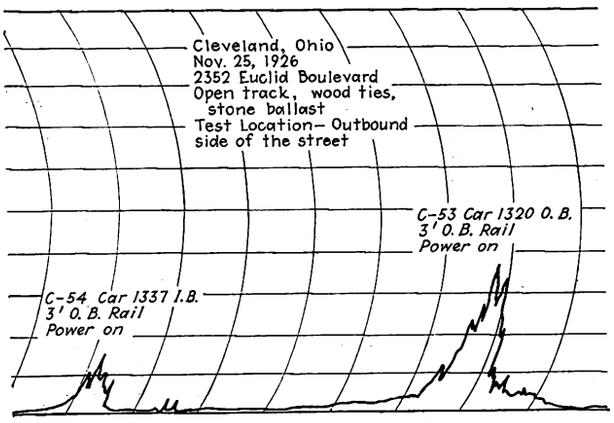

Fig. E.—These graphs, taken on open track in Cleveland, are of especial interest. The horn was located 3 ft. from the shoulder rail of the outbound track for both tests. The track centers were about 15 ft. apart. The car speed for C-53 was about 16 m.p.h.

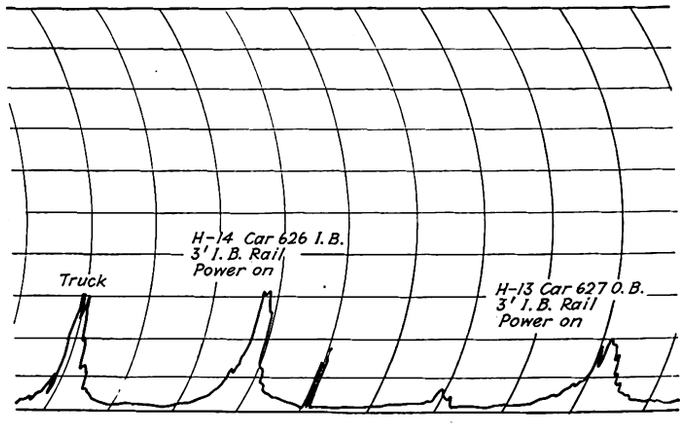

Fig. F.—The graphs H-13 and H-14 were taken on Second Street, in Harrisburg. The paving is of asphalt with wood block liners along the rails. The horn was located 3 ft. from the inbound shoulder rail and the car speed for H-14 was about 15 m.p.h.

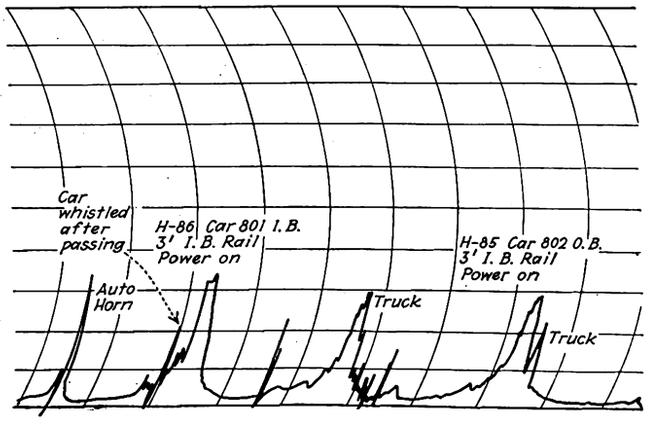

Fig. G.—The graphs on this chart were taken on Derry Street, Harrisburg, with the horn located 3 ft. from the inbound shoulder rail. The speed for H-86 was 18 m.p.h. The auto trucks were as noisy as the cars. The paving is of concrete and the street surface is smooth.

Noise Test Made on Operating Track

Tests from which the following data are abstracted were made in Cleveland, Schenectady and Harrisburg

TABLE I—COMPARISON OF NOISE MEASUREMENTS. HORN 3 FT. FROM RAIL

Town	Paving: Track	Paving: Street	No. Tests	Average Speed	Average Noise
Cleveland	Granite block	Granite block	13	23	39.5
Cleveland	Granite block	Asphalt	9	22	33
Cleveland	Open track	Open track	4	18	31
Schenectady	Granite block	Asphalt	24	17	28.5
Harrisburg	Asphalt	Asphalt	19	14	27
Harrisburg	Concrete	Concrete	7	18	31

Digitized by Google

pact blows at the joints cause noises not heard on properly maintained paved track and that in general the noise graphs for the open track show a longer duration of noise because of the transmission of the impact vibrations by the rails.

The noise incident to automobiles and other vehicles is clearly indicated on several of the graphs. Irregularities in the graph just before or just after the passage of a street car are records of street noises resulting from causes other than car operation.

Tabulations of the analyses of a number of the noise graphs are shown in Tables I and II. The "average noise" is in each case the mean for number of tests made under similar conditions of car speed and traffic.

Plastic Paving Deadens Noise

In general, plastic paving surfaces resulted in less noise than hard surfaces and smooth paving was noisier than rough paving, street car noise alone being considered. Table II shows clearly the effect of type of paving on the volume of noise heard at a short distance. The granite block paving was quite as "hard" as the concrete, but because of its roughness a much poorer reflector.

A few tests made with the horn placed 25.6 ft. from the gage line of the nearest rail showed that for asphalt paving the noise was 29 per cent of that at the 3-ft. distance and for smooth-surfaced concrete 68 per cent, the noise at the 3-ft. distance being about the same.

As might be expected, the volume of apparent noise is greatly affected by car speed. Test data for car speeds below 7 or 8 m.p.h. show that for the low speeds the observed noise was very low. There seems to be a critical speed for a given type of car above which the noise increases rapidly with an increase in speed.

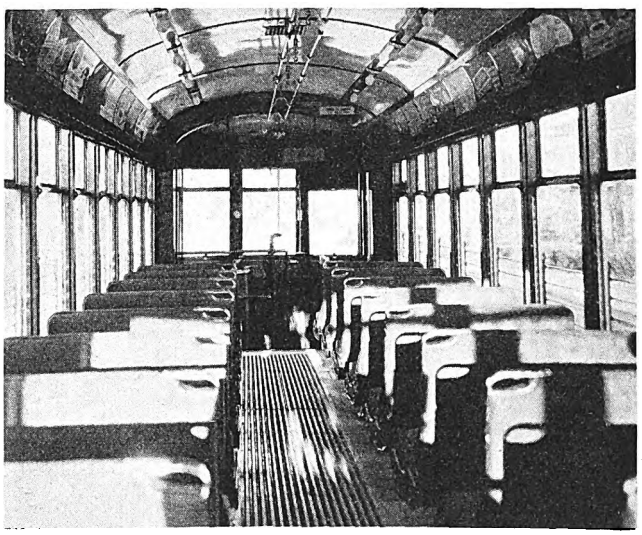
A careful study of the test data and observations made on car operation during the test leads to the conclusion that where the track area is paved and the track and paving well maintained but little noise emanates from the rails themselves. The condition of the rails as to smoothness and freedom from sand and pebbles has an important bearing on the noise caused by the car. The street surfacing plays a major part in transmitting and reflecting the noise emitted by the car and is therefore an important secondary agent.

Southern Company Prefers New Cars

Six steel cars were built by the Southern Public Utilities Company in preference to remodeling six steel one-man, two-man cars

By W. B. Osborne
Master Mechanic Southern Public Utilities Company, Charlotte, N. C.

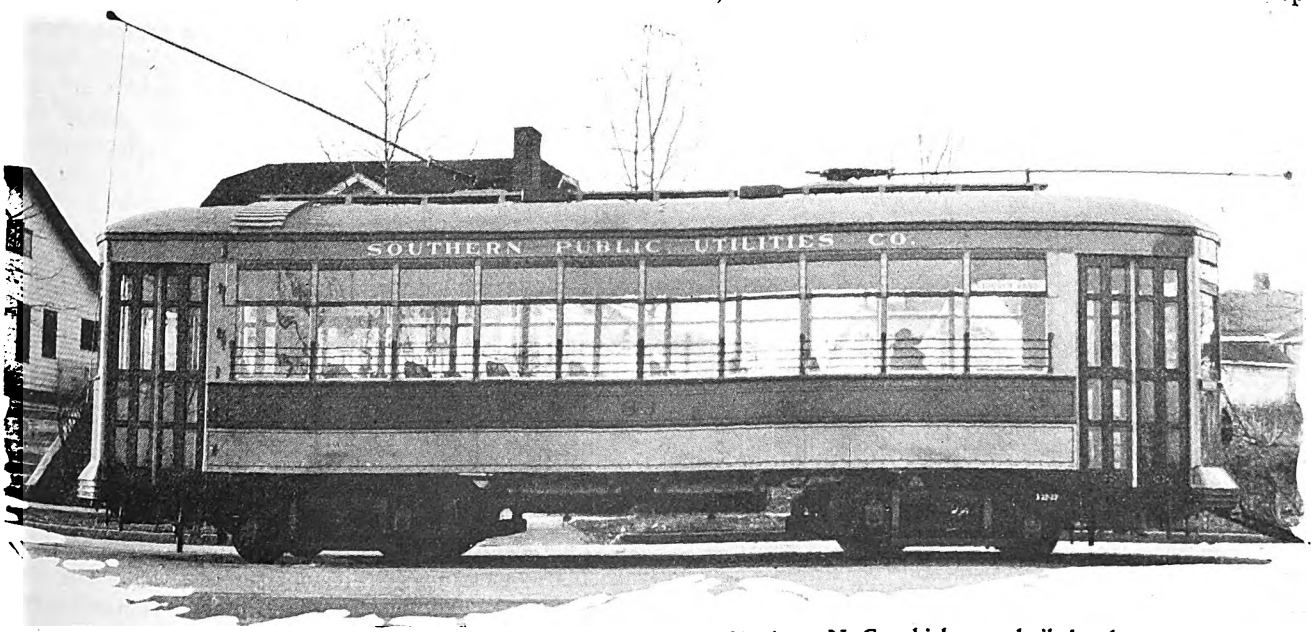
REALIZATION of the importance of attractive and comfortable cars as a medium for increasing the riding habit led us early in 1925 to decide on a program of car reconstruction. We had not proceeded very far with the rebuilding of the first car when it was found that



The new Charlotte cars are roomy and airy. They are arranged for operation by one man or two men

the cost of the remodeling would be prohibitive. It was then decided to build entirely new steel-frame cars and to scrap the old.

We have completed three 33,000-lb. double-truck, one-man, two-man steel-framed cars in our Charlotte shop



One of the new cars of the Southern Public Utilities Company, Charlotte, N. C., which were built by the company

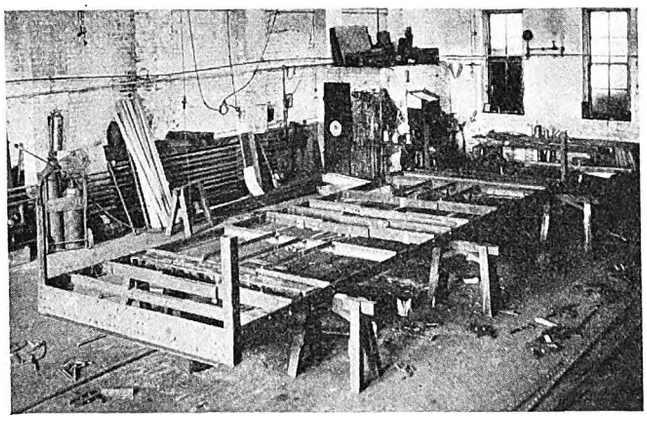
DETAILS OF EQUIPMENT FOR THE NEW CARS OF THE SOUTHERN PUBLIC UTILITIES COMPANY

Number of units	6
Type	One-man, two-man, motor, passenger, city, double-end, double-truck
Seating capacity	40
Weights:	
Car body	20,000 lb.
Trucks	10,000 lb.
Equipment	3,000 lb.
Total	33,000 lb.
Bolster centers	18 ft. 10 in.
Length over all	38 ft. 3 in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	11 ft. 6 in.
Body	All steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Heat treated
Bumpers	Hedley anti-climber
Car signal system	Faraday
Car trimmings	Dayton
Control	K-36
Curtain fixtures	Morton Manufacturing Company
Curtain material	Pantasote
Destination signs	Keystone
Door mechanism	Manual
Doors	Folding
Finish	Pratt & Lambert enamel
Floor covering	Wood strips
Gears and pinions	Tool Steel
Hand brakes	National
Heaters	Consolidated
Headlights	Ohio Brass
Headlining	Agasote
Interior trim	Cherry
Journal bearings	Plain, MCB type
Journal boxes	MCB type
Lightning arresters	G. E. electrolytic
Metal sash	Curtain Supply Company
Motors	Two Westinghouse 532-B, outside hung
Registers	Ohmer
Roof material	Tuco canvas
Safety car devices	Safety Car Devices Company
Sanders	Ohio Brass
Sash fixtures	Curtain Supply Company
Seats	St. Louis
Seating material	Kemi-suede
Slack adjusters	American automatic
Steps	Folding
Step treads	Irving Safkar
Trolley retrievers	Ohio Brass
Trolley base	Ohio Brass
Trucks	Brill 39 E-1
Ventilators	Utility
Wheels, type	Standard, diameter 34 in.
Wheelguards	H-B lifeguard

and the fourth is well under way. The tentative program calls for the building of six or more of these cars to replace wooden cars which have served their usefulness.

The sills of the new cars are made of 4½-in. x 3-in. x ⅜-in. angle and reinforced by 4-in. channel cross-members, spaced 36 in. apart and hot-riveted to the side sills through clip angles. Steel tees are used for the trap-door framing. Carlins made from 2-in. x 1½-in. x ¼-in. steel tees and installed in one piece from side sill to side sill form the contour of the roof.

The side of the car is covered with No. 10 gage sheet steel plates 32 in. wide, whereas the letterboards are No.



Framing of one of the Charlotte cars laid out in the shop preparatory to erecting the posts

16 gage sheet steel. These plates are shaped to provide waterproof joints.

The 3-in. x 3-in. x ¼-in. window sills are copper flushed at all joints and soldered to the window posts to prevent the entrance of water. Flooring is made from ⅞-in. x 3¼-in. best grade oak and a 24-in. center wood matting is installed throughout length of the floor. Light cherry interior finish harmonizes with the medium buff colored headlining and the dark slate colored floor.

Sixteen reversible cross seats and four longitudinal seats upholstered in chocolate colored Kemi-suede provide seating facilities for 40 passengers. The cushions are designed with special springs for the comfort of the passengers. The car is illuminated by fourteen main lamps, one door-exit lamp, two platform lamps, two sign lamps and two headlights. The door-exit lamp and the two rear platform lamps are arranged to burn at the same time that the headlight is burning.

Brill 39 E-1 trucks with double springs improve the riding quality, whether or not the car is fully loaded. Sandboxes installed underneath the platform are made waterproof by placing a 4-in. steel ring flush with the flooring and covering with an aluminum ball cover.

Machines Constructed by Welding

WHAT promises to be a revolutionary step in the manufacture of electric machinery is the adoption of electric arc welding for the fabrication of many types of machines by the General Electric Company. This practice, as outlined in an article by R. H. Rogers in the July issue of the *General Electric Review,* results in many decided advantages over the use of castings.

Among the uses of electric arc welding in the General Electric shops are manufacture of magnet frames and armature spiders for direct-current motors and generators and synchronous converters; stator frames and rotor spiders for alternating-current machines; bases, bearing pedestals, guards and air shields or deflectors for various types of machines, etc. In addition to these electric machines, transformer tanks, oil circuit breaker tanks, switch mechanisms and control devices, electric refrigerators, mercury boilers, centrifugal compressors and many other types of equipment are constructed to a greater or less extent by the use of electric arc welding.

For castings it is necessary to maintain pattern shops, pattern storage, core shops and ovens, and foundries, together with space and equipment for preparing the castings for the machine shop. Defects developing after a casting has been poured, cooled and annealed result often in long delays in the completion of a given machine. Other disadvantages eliminated by the use of welding include loss of metal in the casting process, use of excessively heavy parts for very light duty, high machining costs, etc.

Electrically arc welded machines and parts, in addition, have the same strength as castings but are considerably lighter in weight; designs are not restricted to existing patterns; less copper is needed to produce the same density of field flux in rotating machines; greater freedom in ventilation is provided, and smaller revolving weights and diameters are obtainable.

Each large electrical unit is usually built "to order" and has to be designed, to a large extent, specially throughout. When castings are used, this necessitates the preparation of special drawings, patterns and often pits in the foundry. Such work is much simplified with electric arc welding because of the freedom with which standard slabs, plates, sheets and bars can be shaped, and the speed and ease with which parts, including reinforcements and precision members, can be arc welded together. Work can be started on the construction of an arc-welded machine as soon as the drawings are made for it.

The General Electric Company uses both hand and automatic welding in this work. The welding is, however, done largely by automatic machines which impart the desired motion to the electrode.

"Vanishing American" greets another achievement of paleface brother. From this picture a good idea may be obtained as to the coupling mechanism of the giant locomotives

Electric

Colossus of Rails

Now Hauling Great Northern Trains

Two 4,330-hp. motor-generator locomotives at Skykomish, Wash., inaugurate service on new electrified trackage in Cascades. Can haul 200-car train of 70-ton cars

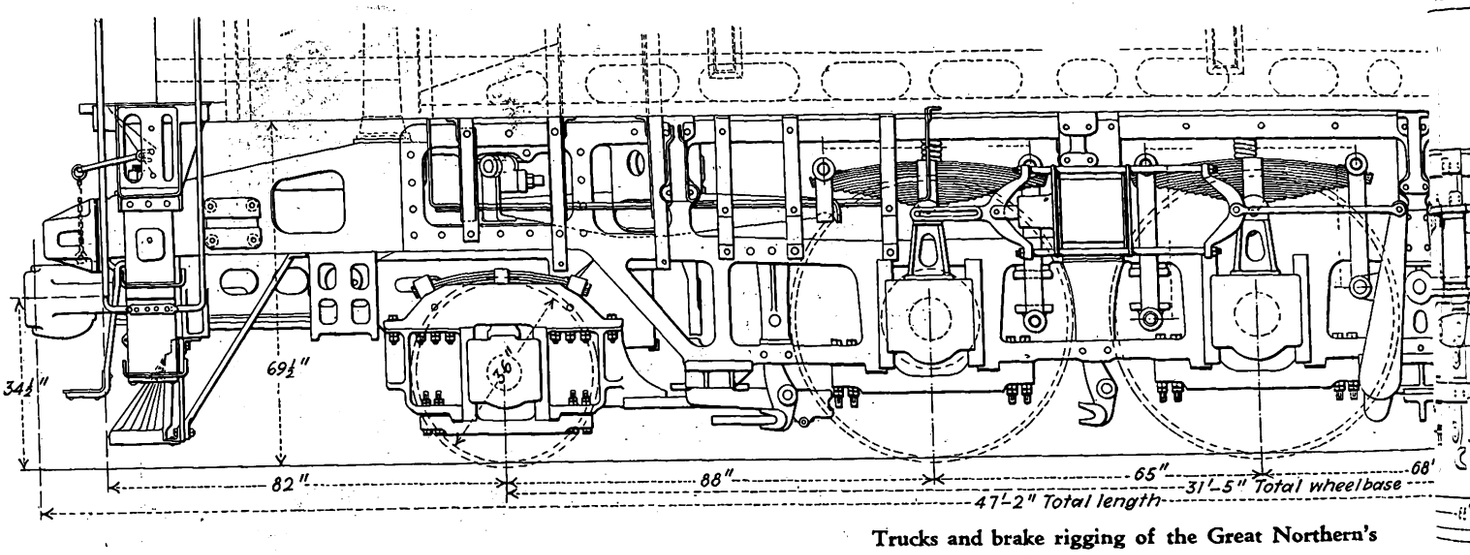
WITH a triumphant tour rivaling that of some royal personage, two of the four giant electric locomotives ordered by the Great Northern Railway in May, 1925, as part of its $40,000,000 Cascade Mountain electrification program have been delivered. They are now hauling the Oriental Limited and freight trains from Skykomish, Wash., 85 miles from the coast, to the east portal of Cascade Tunnel, a distance of 26 miles, and on grades of 2.2. per cent.

The induction into service of these units marks not only the retirement of the three-phase system installed in the tunnel in 1909, but the completion of the 21.4 miles of electrification work in the State of Washington from Tye, at the western end of the tunnel, to Skykomish. Incidentally, this work is the first step of the Great Northern in reducing the enormous operating difficulties presented by its crossing of the Great Divide. The remainder of the project will include the construction of a tunnel 7¾ miles long, 500 ft. below the present tunnel, and the electrification of 96 miles of main line from Gold Bar to Wenatchee, Wash.

Before discussing the project in detail, however, it is of major interest to examine the general specifications for the locomotives, which were recently issued by the joint builders, Baldwin Locomotive Works and Westinghouse Electric & Manufacturing Company. They are given in the accompanying table. Reduced to a simple statement, these locomotives are capable of starting a 200-car train of 70-ton cars.

Technically, the locomotives are a development of the design first used in 1925 at the Ford plant, Detroit, when the Detroit & Ironton Railroad was making an experi-

Digitized by Google



Trucks and brake rigging of the Great Northern's

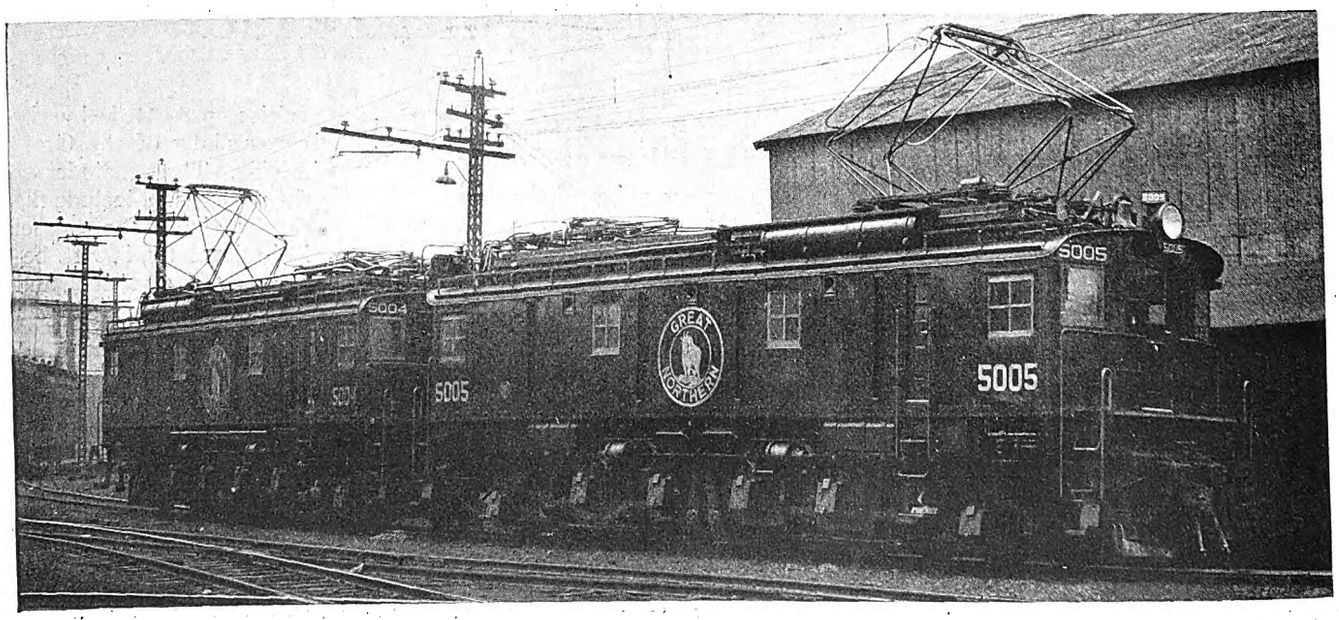
mental electrification of its line. Built to operate on 11,000-volt, single-phase, 25-cycle alternating current, they convert this current by means of a transformer and a motor-generator set into direct current for the traction motors. This means high-voltage transmission to the locomotives with minimum copper loss and power loss, unattended static transformer stations along the railway line, light overhead construction, plus the advantages of direct-current traction motors, and practically unlimited flexibility of control in operation. It also means a system of regenerative braking effective at all speeds, by which the heavy trains can be brought down the steep grades without the use of air brakes, the descending train generating power which is fed back into the trolley and into the power system for any other trains or for general use, while at the same time controlling the speed of the train.

In order to negotiate curves the locomotives are divided into two cabs, which are identical mechanically and electrically. Each cab is self-contained and can be operated alone. It is understood that similar construction will obtain for the other two units, the electrical equipment for which is being turned out by the General Electric Company.

As announced in the JOURNAL for Nov. 20, 1926, the first engine of the Baldwin-Westinghouse order was inspected at Pittsburgh Nov. 16 last in the presence of railway officials and engineering experts for the builders.

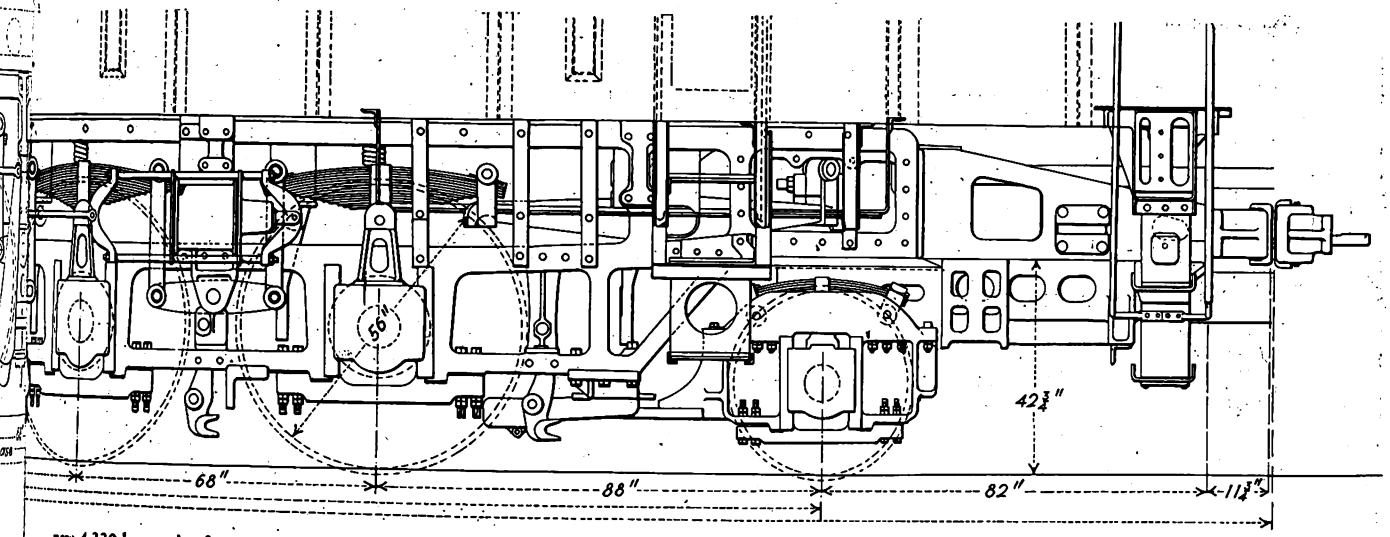
SPECIFICATIONS OF GREAT NORTHERN RAILWAY ELECTRIC LOCOMOTIVES

Total weight	715,000 lb.
Classification of wheels	1-D-1 + 1-D-1
Weight on drivers	549,600 lb.
Number of driving axles	8
Number of idle axles	4
Capacity at one hour rating	4,330 hp.
Starting tractive effort, 25 per cent adhesion	137,400 lb.
Maximum starting tractive effort, 33⅓ per cent adhesion, limited by adhesion	183,200 lb.
Tractive effort—hourly rating	112,500 lb.
Speed—hourly rating	14.4 m.p.h.
Tractive effort—continuous rating	88,500 lb.
Speed—continuous rating	15.5 m.p.h.
Maximum speed	37.5 m.p.h.
Track gage	4 ft. 8½ in.
Total wheelbase	78 ft. 6 in.
Rigid wheelbase	16 ft. 9 in.
Length over all (between faces of buffers)	94 ft. 4 in.
Width over all	11 ft. 0 in.
Height from rail to locked position of pantograph	15 ft. 10 in.
Diameter of driving wheels	56 in.
Voltage and type of conductor	11,000-volt, one-phase, 25-cycle, overhead
Number and type of motors	Eight Westinghouse 356-A
Method of drive	Double flexible gear
Gear ratio	18:91
Type of control	Westinghouse HBFR



Ready for business—one of the powerful 4,330-hp. motor-generator locomotives recently delivered to the Great Northern Railway by the Baldwin Locomotive Works and Westinghouse Electric & Manufacturing Company. Each cab is identical electrically and mechanically, and coupled together they can haul a 200-car train of 70-ton cars

Digitized by Google



new 4,330-hp. units for the Skykomish electrification

Following this it was decided to send the locomotive, known officially as Nos. 5006 and 5007 (each cab was given a number for maintenance purposes), on a tour of the principal cities of the West before inaugurating the new service at Skykomish. Accordingly this unit, with T. E. McGettigan of the Westinghouse test engineering forces acting as pilot, left Pittsburgh Jan. 2. Its itinerary included Chicago, St. Paul, Minneapolis, Glazier Park, Seattle, Spokane, Tacoma, Portland and Everett, it finally being placed in service at Skykomish about Feb. 5. At each stopping place this "Colossus of the Rails" was exhibited in such a manner that the public was able to view the giant machines from every angle. From the souvenir publicity album prepared as a record of the trip and exhibited in the New York office of the Westinghouse company it is estimated that 65,000 persons saw the locomotive during the tour. As far as single crowd records are concerned, Spokane and Portland appear to have been close rivals, it being understood that in each city nearly 5,000 persons visited the exhibits. At Seattle the interest was so marked that not only did the city's woman Mayor, Bertha K. Landes, officially inspect the locomotive but hundreds of citizens waited all day in the rain for a peek at the electrical monster. As will be seen in the accompanying illustrations, the "vanishing Americans" also bowed to another "iron horse" of the paleface, which daily will thunder past their tepees, reminding them of the lordly herds of bison that are no more.

But to appreciate what work these electric locomotives will be called upon to perform it is necessary to examine the operating conditions in the Cascade territory which for years have confronted the Great Northern.

While this carrier, which extends from St. Paul, Minn., to coast cities of Washington State, has the lowest ruling grade to the Pacific Coast of any of the western railroads, it is confronted in the Cascades with severe grades, which, to make matters worse, are against the load movement. Here, to gain the summit of the range, the single track not only makes a precipitous ascent, but a very circuitous alignment on the western slope is necessary in order to make railroad operation possible. In addition, there are several tunnels on the western slope, the longest of which is Cascade Tunnel, located at the summit.

Between Seattle and Skykomish the profile shows that the grades are not unduly heavy nor are the curvatures excessive, heavy grades and curves being confined to that section on the west slope of the Cascade Mountains between Skykomish and Cascade Tunnel, and on the east slope between this tunnel and Leavenworth, Wash. On the west slope a continuous grade of 2.2 per cent is encountered from Skykomish to Tye, a distance of 21.4 miles, with curvatures up to 10 deg., and from Tye to the summit of the range through Cascade Tunnel the grade is 1.7 per cent.

Facing these conditions, in 1909 the original electrification was installed through Cascade Tunnel mainly for the purpose of eliminating gas and smoke so as to expedite train movement. It extended from Tye at the west portal to Cascade Tunnel station at the eastern portal, and comprised 4 miles of main line track and 4

The Everett-Wenatchee section of the Great Northern Railway, showing location of new tunnel and power lines that will furnish energy for the electrification

miles of yard trackage. The 6,600-volt, a.c., three-phase, 25-cycle system was used with a double overhead catenary trolley.

When the original installation was made it was necessary to erect a hydro-electric generating station at Tumwater on the Wenatchee River, 30 miles from the tunnel. Power produced here by two 2,000-kw., three-phase, 25-cycle, 6,600-volt units was transmitted to the substation at Cascade Tunnel at 33,000 volts. Water was brought to the plant, which operated under a head of 176 ft., in an 8½-ft. flume, 2½ miles long.

With this set-up an eastbound train of about 60 cars, weighing 2,500 tons, was taken from Seattle to Tye. There the steam helper locomotives were replaced by the electrics, two ahead and two in the middle of the train. From Tye the run to Cascade Tunnel station was made in 22 minutes. The electrics were then cut off and the train reassembled with steam locomotives for the 53-mile trip to Wenatchee.

Such were the Great Northern's operating conditions until, realizing that the original electrification had served its purpose and that it was being operated at an extremely high cost, the management after a careful study of the situation decided that considerable improvement in schedules and a reduction in operating expenses could be effected by a new system of electrification.

The experience, both favorable and unfavorable, gained from the original electrification was therefore very helpful in selecting the new 11,000-volt, 25-cycle, single-phase system.

Some of the reasons advanced by the company for the use of 25 cycles on the new system as compared with the standard commercial frequency of 60 cycles are:

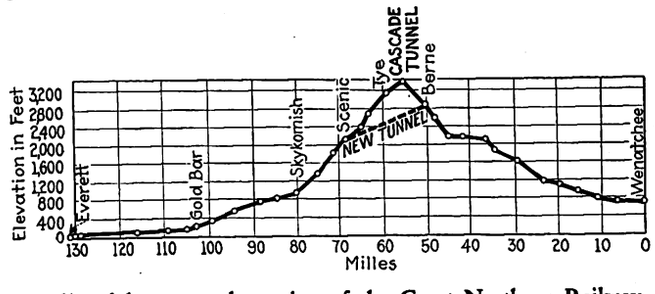
1. Facilitates use of full capacity of 6,000-kw., 25-cycle output of Tumwater plant because of liberal design of three-phase machines, which make possible full nameplate capacity at single phase.
2. Some kind of rotating apparatus would have been required to convert single-phase railway load into balanced three-phase load on the power system supplying the energy.
3. Twenty-five cycles is standard for railway transformers and much other equipment which has been developed.
4. Less interference with communication circuits at 25 cycles.
5. Regulation of 25-cycle system is considerably better on fluctuating loads, and losses are less than on 60-cycle system.
6. Because of higher impedance of rails copper ground return would have been required for 60 cycles.

In addition, it is pointed out that with the new electrification it will be possible always to operate at practically an unlimited number of speeds up to the continuous rating of a locomotive. The method of accelerating a train by means of voltage control of the motor reduces both starting losses and power demand. By using a synchronous motor to drive the conversion set on the locomotive power-factor correction is obtained. For regenerative braking it is possible to regenerate at all speeds and with the varied train weights within the established range of the locomotive to practically standstill.

The Great Northern has contracted with the Puget Sound Power & Light Company to supply all power for the electrification. The Tumwater generating plant will be operated by the power company and tied in with its system through a 44-kv. railway transmission line at present and later possibly by its 110-kv. transmission line going via another route over the mountains to Wenatchee.

The present project involves the construction of a 110-kv., three-phase, 60-cycle transmission line from the Beverly substation of the power company, near Everett, Wash., to Skykomish; the erection of two new outdoor substations at Scenic and Cascade, respectively; a frequency changer set installed in the Skykomish station, where connection is made with the 110-kv. transmission line of the power company, and the erection of the 44-kv. railway transmission line from Skykomish to Tumwater.

The two 44-kv. railway transmission lines, the trolley construction and signal line are all being carried on single poles along the right-of-way. The trolley contact line is No. 4/0 cadmium bronze supported by inclined catenary type of construction.



Profile of heavy grade section of the Great Northern Railway between Everett and Wenatchee in the State of Washington. New tunnel shown by dotted line will be 7¾ miles long and 500 ft. below the level of the present tunnel

Signal Interference Being Studied

Careful consideration has been given to possible interference to signal and communication lines due to the single-phase system. The d.c. signal system will be changed to a.c. 60 cycles with 6,600-volt transmission. Telegraph and telephone lines will undergo general revamping, using necessary cables or removing them from the right-of-way entirely. Local telephone lines hereto-

Digitized by Google

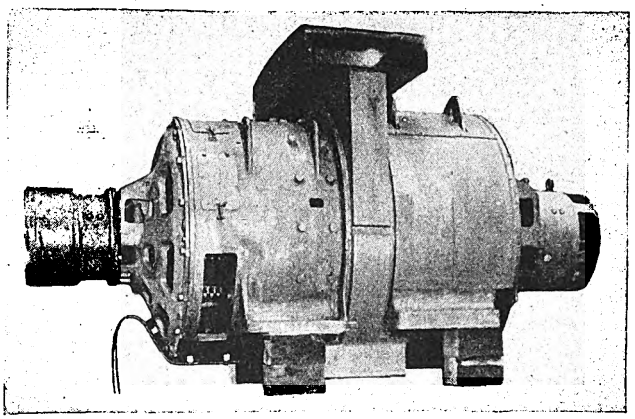
fore adjacent to the right-of-way will be removed to a convenient distance to avoid inductive troubles.

Metering presented some interesting problems to the power company owing to the condition of the contract which calls for the simultaneous measurement of demand at two widely separated points. In addition, it is necessary to take into account power fed back into the power company's system by the Tumwater plant and by the electric locomotives when regenerating. Power will be measured by two three-phase ratchet meters at each point and demands will be measured by graphic meters to obtain simultaneous records at the two points.

According to the contract, billing for power will be made on the basis of the average of the three highest five-minute demands during the month. In the event of power failure any peaks occurring during the first fifteen minutes after service is restored are to be ignored. As all power taken by the railway company from the 110-kv. line of the power company will first pass through the frequency changers, driven by synchronous motors, it will be possible to maintain unity power factor or even a leading power factor if desired.

Simultaneous with the rehabilitation and extension of the original electric section a new tunnel through the Cascade Mountains is being driven, and when completed this will be the longest railway tunnel in America, 7¾ miles. The present line crosses the divide at an elevation of 3,385 ft. above sea level. As mentioned elsewhere, it has sharp grades and curves, numerous snowsheds and several tunnels, one of which is the Cascade, 13,873 ft. long. On account of heavy snowfall, which reaches a maximum of 410 in. at one point and 670 in. at the Cascade Tunnel each season, it is difficult and expensive to keep the line open for operation. Increasing importance of a thoroughly dependable line, the necessity for additional snowsheds on the present route and the heavy repairs on the existing snowsheds brought expenditures to a point where a new line on a lower level would show a substantial gain.

The new tunnel line will shorten the right-of-way more than 7½ miles, eliminate nearly six complete circles of



Motor-generator set consisting of a.c. synchronous motor, d.c. generator and two exciters for the electric colossus

curvature and will escape most of the severe snow trouble. The grade will be the same as the present tunnel, but the elevation will be 500 ft. lower. Electric power is being used throughout in its construction, which it is expected will be completed in about two years.

As far as the line on the eastern slope is concerned, the Great Northern is not especially interested in electrifying it at this time, as certain changes in alignment, coupled with other reasons, make it impractical.

Three Out of Every Four Hold Stock

MORE than 10,500 of the approximately regular 18,000 employees of Public Service companies subscribed for 18,511 shares of 6 per cent cumulative preferred stock of Public Service Corporation of New Jersey in the 25th anniversary offer to employees which opened on May 20 and closed recently. Taking into consideration the many employees who have subscribed for previous issues of Public Service stock, it is estimated that three out of every four employees are stockholders.

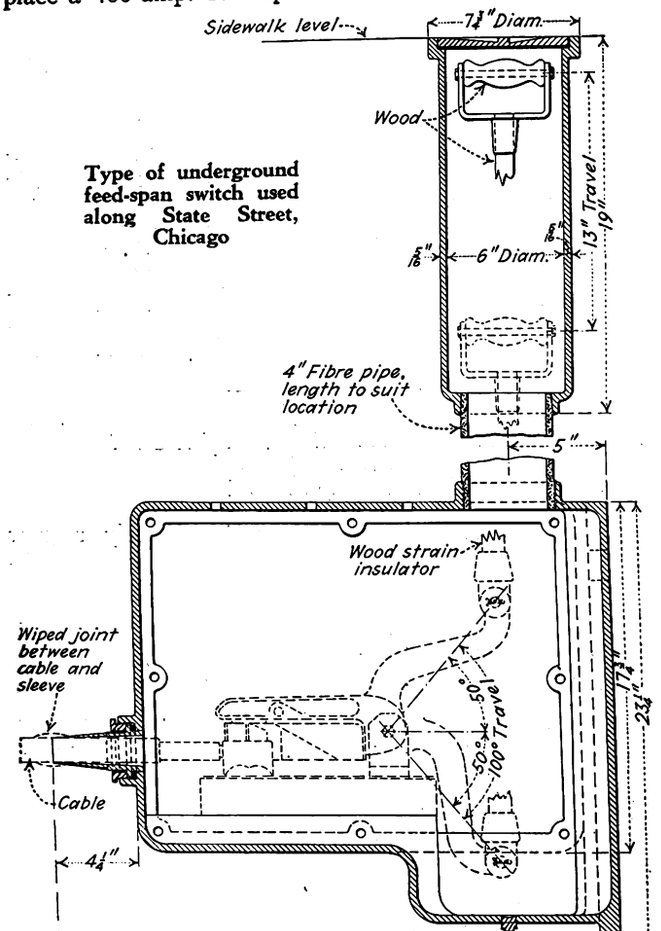
Underground Switches for Feed Spans

By A. J. Klatte
Electrical Engineer Chicago Surface Lines

WHEN an ornamental lighting system was installed on State Street, Chicago, between Lake and Van Buren Streets, the local business men's organization objected to the presence of anything on the poles which might detract from their ornamental appearance. The standard practice of the Chicago Surface Lines is to place a 400-amp. feed-span switch in a wooden box on every fourth pole 12 ft. above the sidewalk. To overcome the objection of the business men's association an underground switch was designed and installed along State Street.



Type of underground feed-span switch used along State Street, Chicago

Basements in practically all of the stores run out to the curb line, the space under the sidewalk being used for storage, etc. The switch boxes are mounted on the retaining wall or hung from the ceiling in these basements. To conceal the cables as much as possible they are run underground from the manhole through the retaining wall to the switch box. From the switch box they pass upward through the trolley pole and out the top, then through the bottom of the urn of the ornamental casing and thus to the feed span.

A vertical tube was installed through the sidewalk and connected to the box by a 4-in. fiber conduit. The conduit insulates the box from the tube to protect pedestrians from shock if for any reason the box should become energized. The top of the tube has a bronze screw cover which rests on a rubber gasket. Inside the tube is a wooden handle connected to a treated wood rod, which is in turn connected to the switch arm. To open the switch the cover is screwed off the tube and the handle pushed down. To close the switch the handle is pulled upward. The arm on the switch travels through an arc of 100 deg. With this arrangement it is necessary to enter the basement only to make repairs, the switch being opened and closed from the sidewalk.

The box is lined with ¼-in. asbestos board for protection in case the switch is pulled under a heavy load. Cables entering the box are 500,000-circ.mil lead-covered, rubber-insulated, with a wiped joint between the cable and the nipple, which has been made waterproof. While the basements are free from moisture, the boxes also have been made waterproof. In the bottom of the box a sump is provided with a pipe plug for draining if water should enter the tube from the sidewalk. To make the mechanism readily accessible for repairs the sides of the box are removable, with rubber gaskets around the flanges to keep out moisture.

Outing and Recreation Bureau—New Service Adjunct

FOUR high-speed, electrically operated railroads and other public service companies serving the Greater Chicago area have completed plans for the establishment of a new service to the residents of this territory under the auspices of the Outing and Recreation Bureau. Information of the most detailed character concerning any resort or city served by the associated railroads sponsoring and maintaining the bureau will be supplied on request. This initial function will be augmented in the near future by a home-finding bureau, which will supply authentic information concerning values, locations and other details of homes in the Chicago district.

Following an exhaustive survey a mass of informatory data has been collected on fishing, bathing, boating, horseback riding, hiking, picnicking and sightseeing in some of the most ideal places. The bureau will give rates, train times and even sell tickets for any party, large or small.

A new service expected to prove widely popular has been established by agents of the bureau to the widely known sand dunes of this territory. By calling the bureau arrangements can be made for long or short hikes through this marvelous natural paradise under the direction of guides long acquainted with the region. At small cost the entire trip will be planned by bureau agents, including meals, guide service and fares.

One of the many attractive features of the bureau's special tours which have been mapped out is their low cost. Attractive literature, including leaflets of resort information, has been gathered by the bureau for distribution. The bureau is located at 72 West Adams Street, Chicago. With its development it is planned to establish branches in other sections of Chicago, as well as in important cities served by the railroads. The companies other than the South Shore Line which have had a part in its organization are: Chicago, North Shore & Milwaukee Railroad, Chicago Rapid Transit Company, Chicago, Aurora & Elgin Railroad, Shore Line Motor Coach Company, Midland Utilities Company, Commonwealth Edison Company, Peoples Gas Light & Coke Company, Public Service Company of Northern Illinois and the Utility Securities Company.

Rejuvenating the

Overhead Contact Line

By L. W. Birch
Line Material Engineer Ohio Brass Company

Many miles of interurban trolley may be rendered suitable for higher speed by removal of poles and substitution of catenary suspension to replace the old direct suspension, with a saving in net operating cost

This article, showing a method for improving operating conditions on many interurban railways, is abstracted from a paper presented at the summer meeting of the Central Electric Railway Association, Detroit, Mich., June 30-July 2, 1927. The plan is well worth the consideration of managements faced with replacement of the contact system.

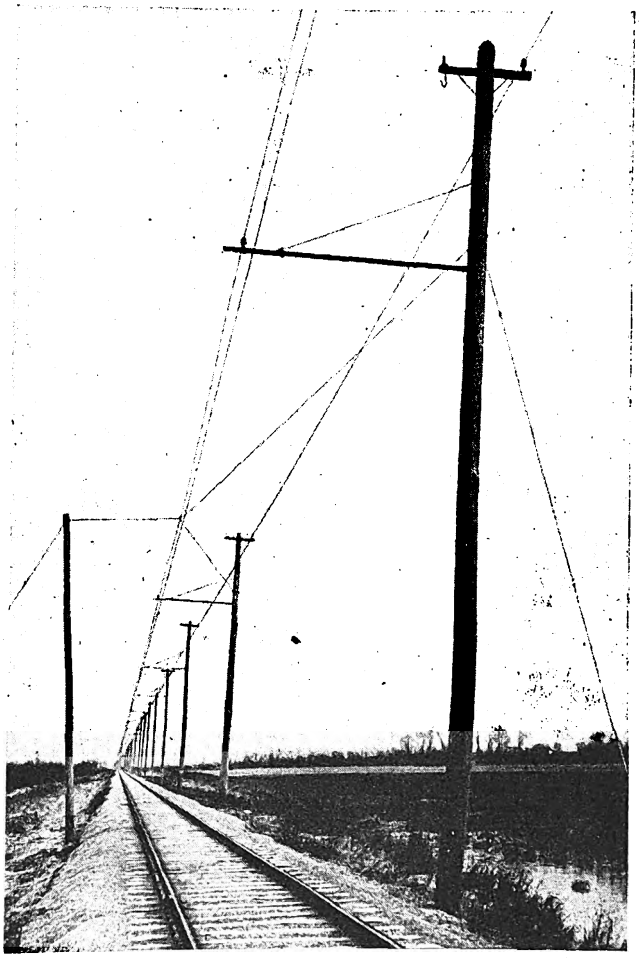
DURING a span of twenty years since most of the interurban railways were built, the life of an ordinary untreated cedar pole has passed, the usefulness of the average piece of direct-suspension overhead has been spent, service requirements on the roadbed and feeder systems have changed, the automobile may have changed the entire makeup of the railroad from a slow-operating system of local trains to a high-speed freight and passenger service between large towns, and so on. However, we are now interested in poles and overhead.

If a specific interurban line has been properly maintained, every pole, every bracket arm, every guy, every trolley span, and every piece of hardware is carrying its respective load with the proper factor of safety. If the line has been neglected, the overhead system is now quite unreliable, the weak spots are upheld by the strong, and if service is maintained at all it is maintained at a cost all out of proportion to that necessary for good overhead.

The road maintaining a worn-out overhead may be facing the serious problem of complete rehabilitation, while the road with proper maintenance may be approaching the same problem, inasmuch as the service the road hopes to maintain may call for a more substantial overhead, both mechanically and electrically.

Rehabilitation of interurban overhead construction may be done using light catenary as the overhead system. First, let me enumerate some of the reasons for such rehabilitation. These are:

1. Worn-out overhead.
2. Speed requirements.
3. Service and reliability as demanded by the public.
4. Visibility.
5. Appearance.
6. Maintenance reduction.



A tangent on a well-constructed line using a light catenary suspension

All but item 1 may occur on either the well maintained or poorly maintained line.

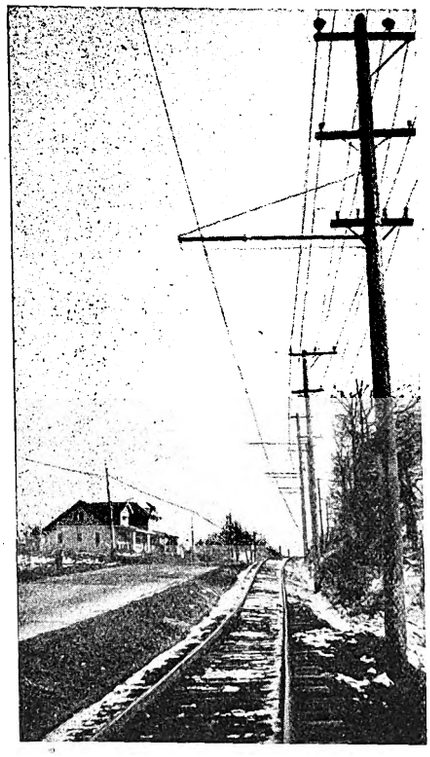
Let us first determine why some form of light catenary is suggested. This can best be accomplished by enumerating its advantages:

1. Constant height of trolley wire, providing smooth under-run.
2. Less delay due to trolley wire breakage.
3. The supporting system may be used for added conductivity.
4. Porcelain insulation, which is more reliable, may be used.
5. Long spans give good signal visibility and pole clearances.
6. Voltage range is possible for the same overhead.
7. Appearance is good.

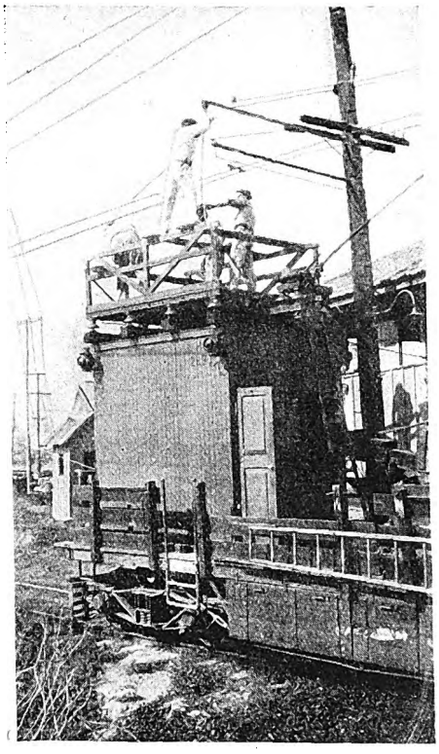
If a trolley wire could be stretched from one end of the line to the other without supports, and would maintain a constant height relative to rail, conditions would be ideal—no hard spots due to hardware and no sudden angles in wire. This is approached by catenary construction and the advantages on this score are less abuse, longer life and less maintenance. The latter includes trolley wheel wear and base breakage.

Consider first the system which must be rebuilt from the ground up. A new direct-suspension system on 35-ft. wood poles, not including telephone, high lines and feeder, would cost approximately $3,000 per mile including poles, trolley wire, fittings and labor. This cost is equivalent to that for a light catenary system employing $\frac{7}{16}$-in. Siemens-Martin steel messenger wire, T-bar bracket arms, porcelain messenger wire insulators, with 15-ft.

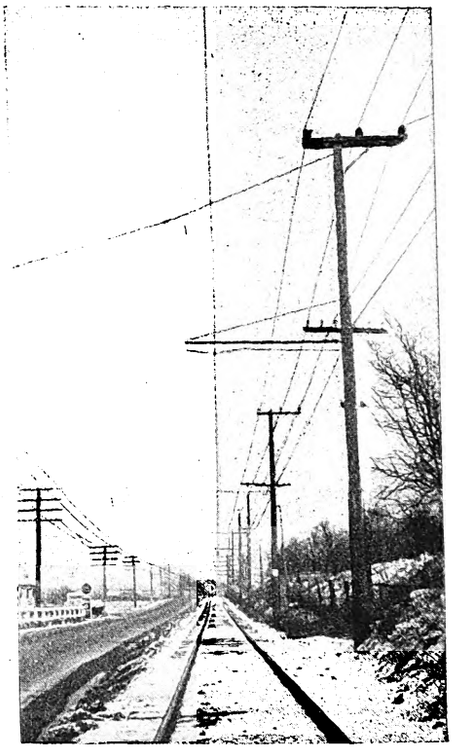
Digitized by Google



There are many miles of interurban railways using this construction for overhead and transmission line



Method that was used by one company in changing from direct suspension to the catenary system



Short pole spacing with low poles was used on many miles of construction, which is not economical today

hanger spacing. This again includes trolley wire, old fittings and labor.

The direct suspension system would necessitate 100-ft. pole spacing, while the catenary system of equivalent cost would use a greater pole spacing, for example, 150 ft., or 52 poles per mile for direct suspension, and 36 for catenary. Western red cedar, white cedar, or other classes of poles bought under specifications today are capable of supporting a 600-lb. weight with a factor of safety of 6, at the end of a 9-ft. bracket arm without guys, the arm attached 20 ft. above the ground line of the pole. The light catenary system just mentioned only weighs 1.1 lb. per foot with no ice or wind loading, and approximately twice as much with ice and wind loading. Under adverse conditions in winter a span 200 ft. long would weigh 440 lb.; adding the weight of pole hardware, the total weight is less than 500 lb. per span at such a time. Consequently, it is not only safe to assume, but good common sense to recommend, that pole spacings of 200 ft. on wood poles are desirable. I enjoyed the privilege of assisting on a 20-mile job of rebuilding three years ago where the spacing was 225 ft. This line withstood a recent cyclone without a pole failure other than one or two due to falling buildings. And even with this trouble, the system was quickly pulled into shape without additional material, and with a very slight reconstruction charge. With this greater pole spacing, a catenary system built on the same basis as that previously mentioned would cost about $300 less per mile. There are numerous advantages with this extended spacing other than those that have been mentioned. For instance:

1. The maintenance and depreciation cost per mile is reduced chiefly through the lesser number of poles.

2. There is less hazard through insulator failure than with the line with more insulated points per mile. This hazard is ridiculously low compared to direct suspension with its many points of insulation employing inferior insulators.

3. Greater visibility is obtained.

4. Less hazard to the transmission line if it is mounted on the poles.

5. Stock in warehouse can be reduced.

6. Power leakage is less.

For double-track cross-span construction there is a greater saving in favor of the catenary employing wood poles, and it is even possible to show that a two-track line using light steel bridges spaced 300 ft. apart can be erected for the cost of two lines of wood poles spaced at 100-ft. intervals.

Revamping the well-maintained direct suspension system requires a little broader view than the complete rebuilding just described. In some instances, the yearly charge incurred by rebuilding is no higher than the yearly maintenance on the direct suspension line. However, this is not always true.

In order more clearly to bring out the conditions to be met and the respective solutions, take two of the more common examples of rebuilding, viz.:

1. A wood pole line, spacing 100 ft., supports of pipe brackets, direct suspension, 35 to 40-ft. poles with a 33-kv. transmission line on top—a telephone line and feeder on wood crossarms.

2. Same as above, except 30-ft. poles and no high line.

The conditions of example 1 are illustrated in two of the illustrations.

For a light catenary system, a wider pole spacing must be adopted. Inasmuch as the present spacing is 100 ft., it is reasonable to think a 200-ft. spacing would be economical since fewer poles must be touched. It will be necessary to remove every second pole, including all attachments, equip the remaining poles with new pole brackets (for strength) and attach pins and insulators for supporting the messenger wire. The catenary sys-

Digitized by Google

tem may then be strung, which gives us a system something like that illustrated in the picture on page 59.

Taking partial credit on the portion above ground of the recovered poles, and also the high-tension insulators, the cost of rebuilding this single-track system would be $800 per mile. No credit for pole brackets, ears, hangers, small insulators, and other pole line hardware is taken. Trolley wire is not considered, inasmuch as it would be on an item in the direct suspension maintenance, if replacing were necessary.

Based on yearly costs, the following figures have been prepared, taking the average of 835 miles of line on five properties for direct suspension and the average of 665 miles on four properties for catenary suspension:

	Cost Per Mile Per Year	
	Direct Suspension	Catenary Suspension
Maintenance	$79.90	$58.60
Pole renewals	150.00	75.00
Interest on $800 new investment at 7 per cent	.....	56.00
Added depreciation ($800 in fifteen years)	.....	53.30
	$229.90	$242.90

In brief, the yearly costs for replacement with catenary are not out of line. Assuming a saving in high line maintenance would be made as the result of longer spans and fewer insulators, the annual cost of the catenary construction may be considered as equal to direct suspension. But this only considers the tangible costs of the two types. If the indirect savings are taken into account, such as the possibility of higher speeds, greater freedom from delays and interruptions to service, etc., it is apparent that although these are difficult to compute definitely the catenary construction offers attractive economies in the modernization program on any interurban road. Furthermore, the new investment of $800 a mile can be advantageously spaced out to avoid large outlay in any one year and to make best use of the direct suspension materials replaced.

In the second example the poles are not of sufficient height to use a 200-ft. spacing with the catenary. Hence, either the line may be rebuilt, using longer poles at an economical pole spacing, or catenary at 100-ft. pole spacing may be adopted. If the entire line were rebuilt, the yearly costs would work out as follows:

	Cost Per Mile Per Year	
	100 Ft. Direct Suspension	200 Ft. Catenary Suspension
Maintenance	$79.90	$58.60
Pole renewals	150.00	75.00
Interest on cost of rebuilding ($1,300 at 7 per cent)	.....	91.00
Added depreciation fifteen years	.....	86.70
	$229.90	$311.30

The annual cost for the catenary can, of course, be reduced by taking some credit on the old poles and materials released in rebuilding.

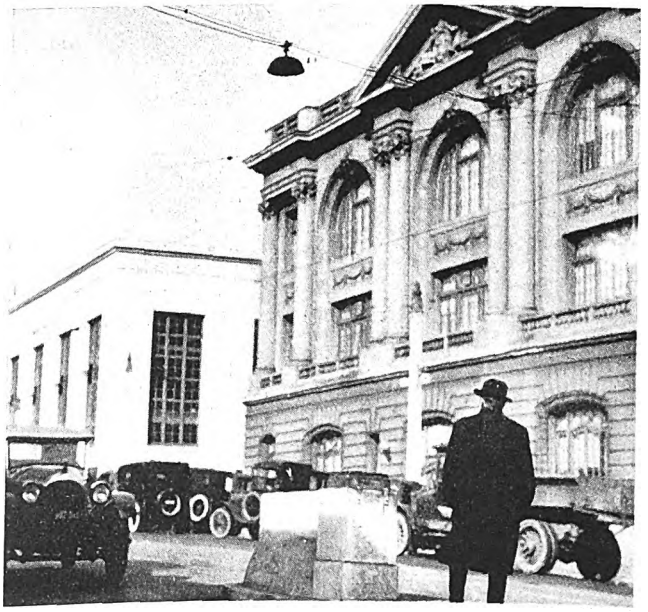
If 100-ft. pole spacing for the catenary is maintained, the direct suspension annual cost is $229.90 and the catenary increases to $345.25 due to the same number of pole renewals as with direct suspension. However, this is only a step in the change-over and should be considered as such, the final step being the change from 100 ft. to some longer and more economical pole spacing.

Change-overs or rebuilding of this kind can be most economically handled by working a section at a time, preferably where the trolley wire is badly worn. For instance, a system is 100 miles long. Overhead materials cost $30 per mile per year. On 100 miles, that would be $3,000. Assuming the reproduction cost of overhead materials exclusive of trolley wire on a single mile of track to cost $400, and assuming the life of these materials to be half spent, any materials recovered during a rebuilding program and shifted to another section would amount to $200 instead of $400 per mile. Putting it in a different way, if the reproduction value of these materials is maintained at $400 per mile, then, due to their life being half spent, it is safe to assume that if reused the maintenance figure should double; instead of being $30 per mile, it becomes $60.

Assume 10 miles to be rebuilt the first year. At $200 per mile, $2,000 worth of overhead at the depreciated value would be recovered. With a maintenance cost of $30 per mile for overhead materials, or $2,000/30, 67 of the remaining 90 miles have been taken care of with reclaimed materials. This same scheme can be used throughout the rebuilding further to cut down the yearly maintenance figure and fixed annual changes.

I have tried to show you that a light-type of catenary is economical. We have tried to obtain public patronage by the appeal of appearance; we have used new cars, newly upholstered seats, color combinations and comfort in general. Why not add to this series of improvements by securing the ability to operate and maintain regularly high-speed schedules, through the installation of a more reliable overhead? Thus, you, as operators, will save money by the installation of light catenary, while the rider will save time through the use of the road, which means more riders and more net revenue.

Safety Platform Light Suspended from Span Wire



ABOVE the safety platform of the Municipal Railway of San Francisco at Van Ness Avenue and Geary Street an electric light with a bowl reflector has been suspended from the trolley span wire. At night this illuminates brightly the concrete bumper at the end toward approaching vehicles. The light is controlled by a switch on a nearby pole.

Maintenance Methods *and* Devices

Cabinet for Paint Storage

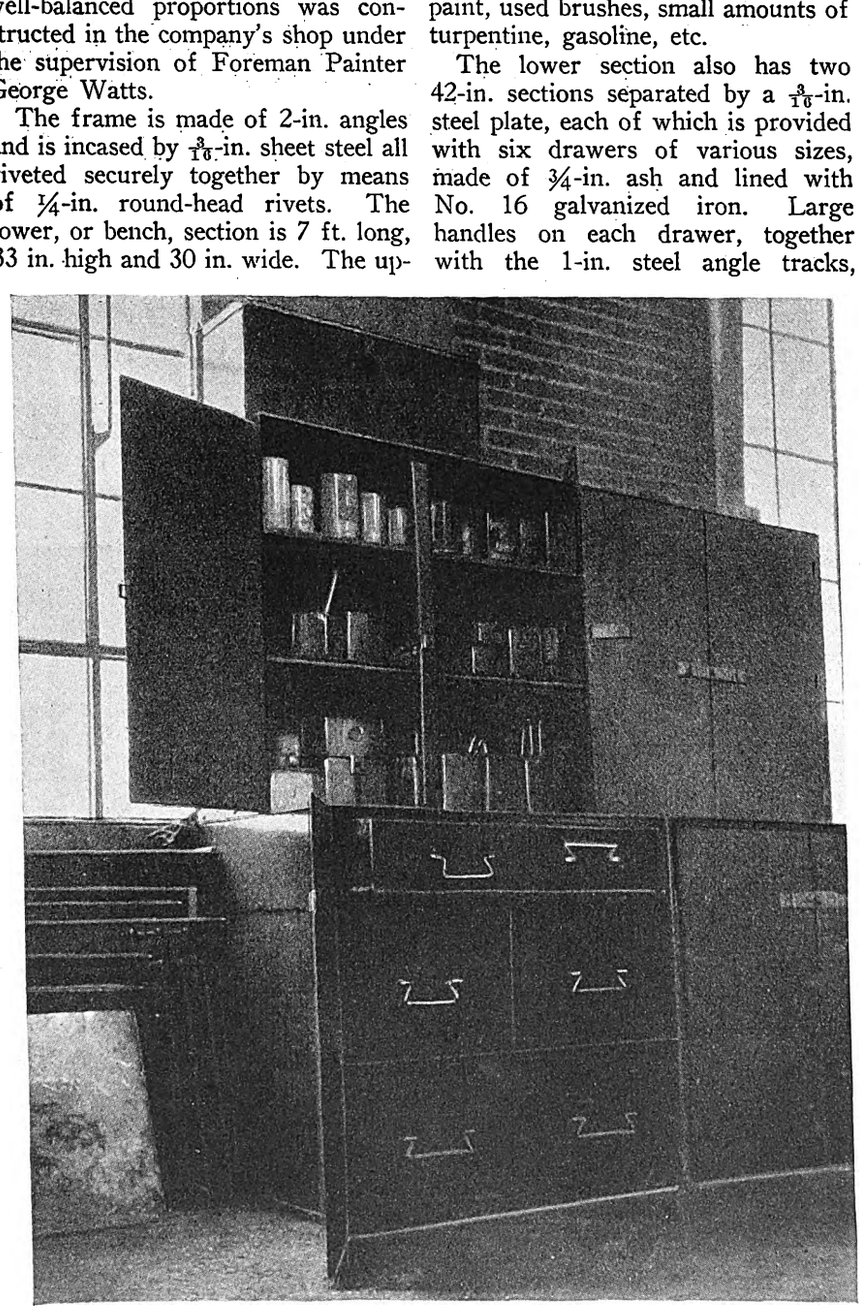
PARTIALLY consumed cans of paint, paint brushes, sponges, pumice stone and other small portions of the various kinds of material used for the painting process in the Academy Junction shops of the Washington, Baltimore & Annapolis Electric Railroad are being systematically, safely and cleanly stored in a fireproof metallic cabinet constructed for the purpose. This cabinet with its rugged construction and well-balanced proportions was constructed in the company's shop under the supervision of Foreman Painter George Watts.

The frame is made of 2-in. angles and is incased by $\frac{3}{16}$-in. sheet steel all riveted securely together by means of ¼-in. round-head rivets. The lower, or bench, section is 7 ft. long, 33 in. high and 30 in. wide. The upper section is 7 ft. long, 34 in. high and 15 in. wide.

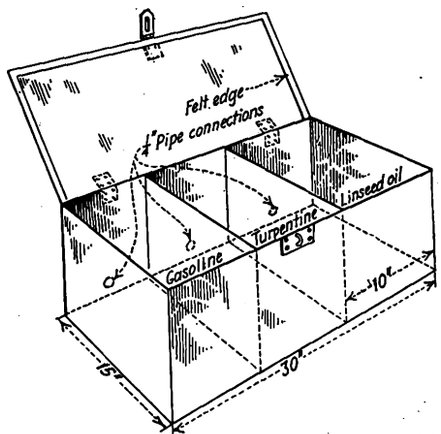
The upper section is divided into two 42-in. sections by means of a $\frac{3}{16}$-in. steel plate partition. Each section has two shelves of $\frac{3}{16}$-in. steel plate resting on 1¼-in. angles riveted to the sides and center. The two $\frac{3}{16}$-in. steel doors are equipped with strong hinges and a clasp for padlocking. The upper portion is used exclusively for storing opened cans of paint, used brushes, small amounts of turpentine, gasoline, etc.

The lower section also has two 42-in. sections separated by a $\frac{3}{16}$-in. steel plate, each of which is provided with six drawers of various sizes, made of ¾-in. ash and lined with No. 16 galvanized iron. Large handles on each drawer, together with the 1-in. steel angle tracks, make for easy sliding movement. These drawers are used for the storage of dry stocks such as sponges, cheesecloth, rags, sand paper, scrubbing material, torches, etc. Each lower section has sheet-steel doors. With all doors closed and locked the cabinet provides a safe and fireproof receptacle for the storage of small quantities of inflammable material.

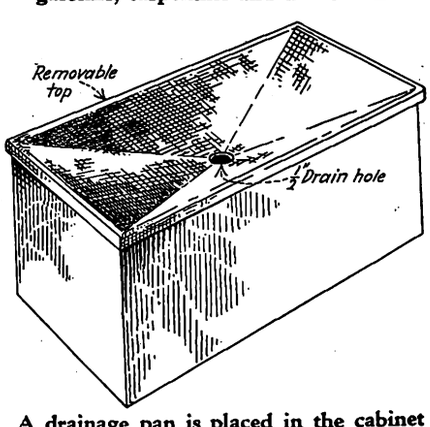
A receptacle for the storage of small quantities of gasoline, turpentine and linseed oil, placed on top of the cabinet, is an unusual and worthwhile feature. This is a 30-in. x 12-in. x 15-in. tank made of $\frac{1}{16}$-in. sheet steel and provided with a sheet-steel cover. The outer edges of this



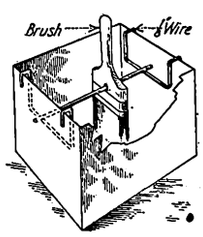
A paint storage cabinet that has been found quite effective in the W., B. & A. shops at Academy Junction



The tank on top of the paint cabinet holds gasoline, turpentine and linseed oil



A drainage pan is placed in the cabinet below the faucets tapping the overhead tank



Handy receptacles for storing paint brushes are made from varnish cans

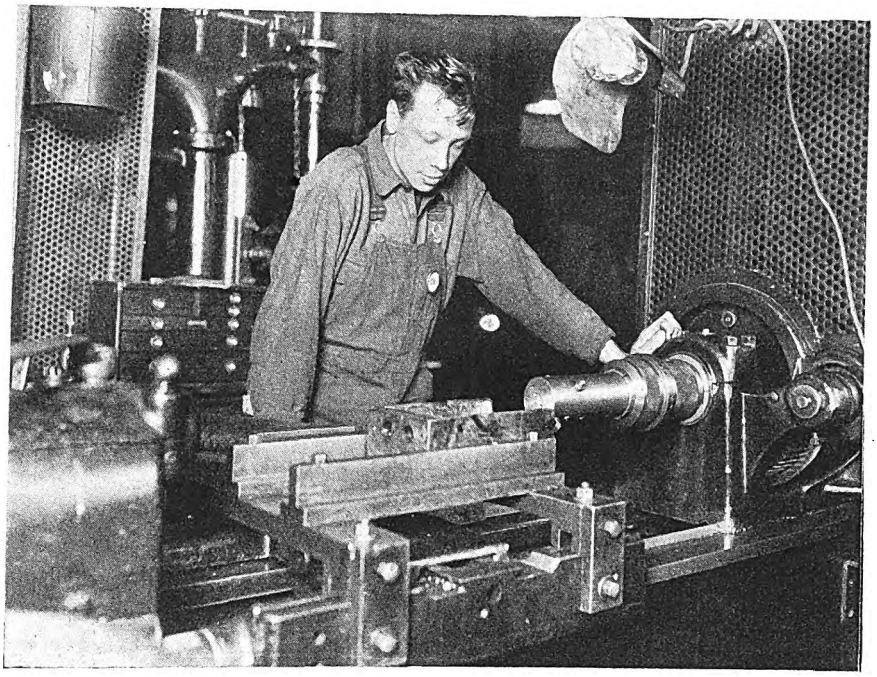
Digitized by Google

cover are lined with ⅛-in. felt to make the container dustproof. This tank is divided into three sections. From the bottom of each a ¼-in. iron pipe extends to a point in the upper section of the cabinet directly under the first shelf, with a valve to permit of easy withdrawal of the liquid when required. Directly underneath the valves is placed a galvanized-iron drainage pan to catch the waste. This pan is made of No. 16 galvanized iron and is 13½ in. long, 6 in. wide and 5½ in. high, with a removable top made of the same material. The removable top slopes toward the center from all edges, with a ½-in. drainage hole.

The storage tank provides a convenient supply of small quantities of the liquids.

Another feature is the method for the storage of paint brushes. Individual varnish cans with the covers cut off are used. Across the top edges of these cans on either end is suspended a ⅛-in. wire hook as shown in one of the illustrations. The head of each brush is drilled with a $\frac{5}{32}$-in. hole. The brush to be stored is placed on a straight ⅛-in. wire. This permits of vertical storage of the brushes in the liquid and keeps the brush off the bottom of the can.

This cabinet with its auxiliary features is centrally located in the paint shop and is readily accessible. It provides a safe and fireproof storage place for inflammable paints, varnishes, etc., and helps to keep the shop clean.



Boring an axle bearing with a special fixture and boring bar at the 39th Street repair shop of the Brooklyn-Manhattan Transit Corporation

Special Boring Bar for Journal Bearings

JOURNAL bearings used in the subway cars of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., have an end section so that in reboring after babbitting the boring bar cannot pass entirely through the brass. The practice of the railway is to bore out each bearing to fit the particular journal with which it is to be used. There is thus a large variety of sizes between the standard and scrapping dimensions of bearings. To bore out one of these bearings with ordinary methods would take a workman one hour. By use of a fixture for holding the bearing and a special type of boring bar, a floor to floor output time was made possible of ten minutes on each bearing.

The fixture for holding the bearing accurately is clamped to the lathe carriage. A bearing placed in this fixture is held securely by two clamping bolts. The work is then moved toward the boring bar, which is fastened to the headstock of the lathe by a spring-collet chuck, the use of which chuck centers the boring bar accurately. This is held firmly in place by a retaining bar that passes through the hollow spindle of the lathe. It is supported further by the spring-collet chuck, which adds materially to the firmness of the bar. The cutter is held in an adjustable nut placed at the other end of the bar. When set to the required size for boring it is locked in place by a wedge operated by nuts.

The cutting tool is set by means of a micrometer which is gaged to one-half the journal bearing diameter plus one-half of the boring bar with an additional clearance of 0.005 in. By this method an accurate bearing fit for each axle is assured.

Another Prize Winner Announced Next Week

JUDGES in ELECTRIC RAILWAY JOURNAL's Maintenance Contest have picked the winning article from those published in the June 18 issue and the winner of the monthly prize for June will be announced next week. The maintenance data sheet section of that issue will also contain another lot of articles submitted in the competition. From these the judges will select one to receive the prize for July, and announcement with respect to the winning contestant will be made in the Aug. 20 issue.

Aug. 1, which is the closing date for articles to be received for the three capital prizes, is approaching rapidly. There are but three weeks left. The monthly prize awards will continue throughout the year, but material to be judged for the $200, $100 and $50 prizes must be in by Aug. 1. Send in the best practices first and do not delay!

Here is a brief summary of the contest conditions:

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated prior to Aug. 1, 1927. For the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints, or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given above will be found in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

New Equipment Available

Points to Be Considered When Installing Crossing Signals

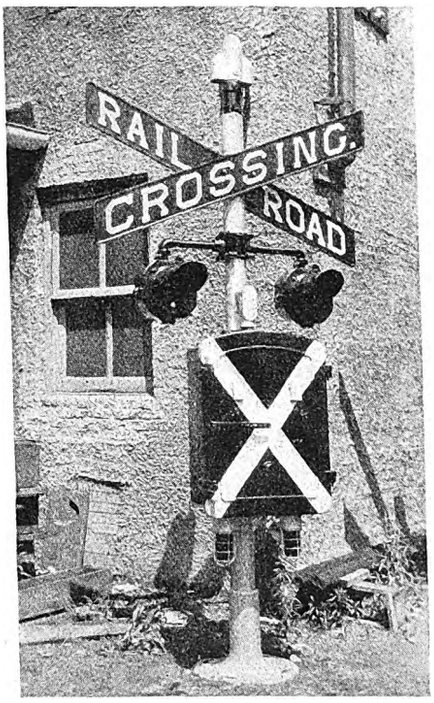
By Carl P. Nachod
President Nachod & United States Signal Company, Inc.

With the increased automobile traffic over interurban grade crossings, automatic highway crossing signals have been subject to some evolution. The overhead starting contactor of the crossing signal made by the Nachod & United States Signal Company, Louisville, Ky., should be placed at such a distance from the crossing that a warning time of 20 seconds will be given for the fastest train. If this speed is 40 m.p.h., then the distance is approximately 1,200 ft. A longer warning than this will result in its disregard by motorists, and it has been shown that 20 seconds is sufficient for a slow ox team to cross.

The motorman's pilot or indicator is an invaluable check to show the motorman that the warning signal has operated. This is a separate hooded light signal placed three or four spans ahead of the starting contactor and pointed directly at the motorman. When he sees this light flash he knows that the warning is being given at the crossing, which may be some distance ahead, or around a curve.

A number of railway commissions have favored the flashing light system of warning indication as specified by the American Railway Association, Signal Division. In New York State, for instance, this is the only official warning permitted for new installations. A bell may be used as an audible signal in connection with the flashing lights, but it certainly should not be used as a warning alone without the lights. If the automobilist drives too close to the crossing standard and stops at one side of it, he will not be able to see the flashing of the lights nor tell when they have been discontinued, but the nearer he is to the signal the louder the bell will sound to him. Moreover, in an accident case, a witness anywhere in the vicinity of the bell could testify that the warning was being given, but with flashing lights, only a witness in direct line of their beams could so testify. For residence locations, bells may be very objectionable, and they should be provided with auxiliary time cut-outs.

It is of the utmost importance that the crossing standard should be as conspicuous as possible. The design shown is striped with aluminum paint over black asphaltum. To locate the crossing at night, independently of the automobile headlight, the yellow light burns continuously in one of the marine fittings at the bottom of the case. This illuminates the base of the standard. It also serves to show that current is on the apparatus and that it is ready to give its warning. Only one of these yellow lamps burns at a time, but should it burn out, the other yellow lamp will be cut in automatically through a reserve lamp relay. The yellow lamps, however, do not burn when the car or train is approaching.



Single standard crossing signal with four projectors

The relays, including those that start and stop the indications, as well as the one which flashes the lights, are housed in a weatherproof gasketed locked relay box convenient for inspection. All wiring is brought into the standard through an outlet at the top in a cable dropped from a messenger. The projectors themselves have parabolic glass mirrors, 56-watt headlight type lamps with concentrated filament and are provided with convex red roundels, which give a spread of about 30 deg. to the beam, changing its section from circular to elliptical. These projectors are supported on pipe brackets with unions, inclosing all wiring and making them adjustable independently, so that one may be pointed for distant viewing, or toward an automobile approaching on a curve, and the other for a nearby indication. When the lamps are supplied from the 600-volt d.c. trolley circuit they are connected in series, but each is shunted separately, so that a failure of any lamp will not open the circuit to the others. A separate flasher relay of the air-break type is used to flash the lamps.

Improvements in relay construction have been made for high-speed systems, so that the car, when passing the overhead trolley contactor, has only to pick up a light relay tongue, moving it $\frac{1}{16}$ in. to make a contact through a "stick" circuit, which will apply and hold current to the main relay until that acts to throw on the warning signal. After this the main relay opens all contactor circuits. Since there are accidental low voltages on interurban systems, due to partial failure of power, the crossing signal must be designed to operate over a wide range, and is actually operative down to one-half the normal line voltage.

The accompanying illustration shows a single standard having all four projectors mounted on it. A preferable arrangement is with two standards, having two projectors each, the relay box being mounted on one of them, or else on a separate pole.

On a double-track crossing the stopping contactor may be set on the far side of the crossing at any desired distance. If this distance is such that the car might be stopped within it, as after an accident, then the warning signal would not be cut off, and all the occupants of the car could be witnesses that the warning was being given. However, if this requires too great a distance, as, for instance, more than 500 ft., the warning might be disregarded by automobilsts, since the danger condition ceases with the passage of the car, and the warning should cease with it.

For single-track crossings this placing of the contactors necessitates overlapped stopping control, the relay system being such that only the contactor on the far side acts to cut off the signal.

Association Activities

"Getting Out of the Rut" Occupies Attention of C.E.R.A. at Detroit

Track design and maintenance, overhead line economics and methods of stimulating business are approached from the viewpoint of meeting present-day conditions

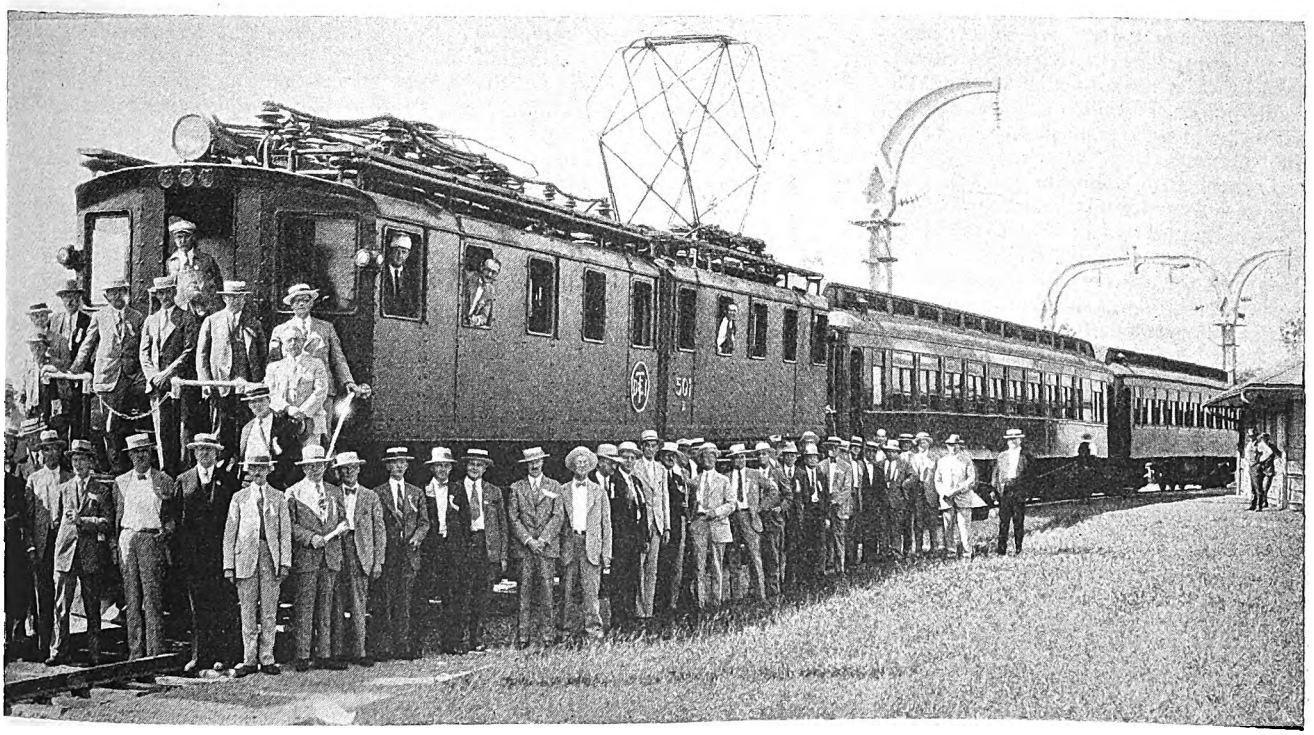
UNDER various subjects and titles the Central Electric Railway Association, at its annual summer meeting held in Detroit on June 29-July 1, discussed the general topic of "Getting Out of the Rut." The construction of electric railway track and its relation to revenue, the application of merchandising methods to the sale of transportation, and an analysis of overhead line economics were the subjects of papers and discussions—all approached from the angle of breaking down the walls of habit and precedent so as to provide better, more reliable and attractive transportation service.

The high spot in the discussion of selling methods was reached in a straight-from-the-shoulder talk by Ernest Cohn, secretary Homer McKee Advertising Company, Indianapolis, Ind. "Electric railways have been asleep," said Mr. Cohn, "while the automobile won the public ear and ran away with a goodly share of their business. Your first job is to whip your own people into line," he continued. "You need to buy hot water bottles for some of them to warm their feet and keep them from quitting in the face of difficulty," was another of his semi-humorous broadsides at the industry.

Mr. Cohn pointed out the part which co-operative advertising on a sufficiently extensive scale could be made to play in winning back public favor and patronage for transportation companies. To illustrate his views, he cited a number of examples of other industries which through concerted and effective advertising had turned the tide of popular favor when they were faced with threatening business conditions. He mentioned the success of the campaign by California grape growers to dispose of their crop by popularizing the eating of raisins when they were faced with the elimination of their market through the coming of prohibition. The "Say it with flowers" campaign by florists, and the "Send it to the laundry" campaign by the laundry machinery manufacturers were other examples cited by Mr. Cohn in support of his views.

In undertaking such work, the speaker strongly urged the importance of employing men competent to judge the proper approach to the public mind. He said that an advertising problem such as that confronting the electric railways is one which involves the state of mind of the community. He pointed out the importance of talking in a language which will penetrate the consciousness of the average man or woman by translation of the transportation sales story into appeals of popular interest.

Advertising of the type advocated is expensive if it is to be made effective, according to Mr. Cohn. He added suggestions for two other methods of reaching the public, one through the employment of trained speakers to address public groups, and the other through the use of effective signs on the cars themselves. He urged, however, that such advertising carried on the cars be made sightly by properly arranged and illuminated frames and by the use of high-grade art work.



Delegates to C.E.R.A. summer meeting inspected the new Ford electric locomotive of the Detroit, Toledo & Ironton Railroad

Better Business Methods Advocated

The subject of better business methods was introduced by President Ackerman. Closer co-operation between the connecting lines in the central interurban territory was strongly urged as a means of building both passenger and freight traffic. "Undoubtedly all of you have known, as I have known, the instances where connecting interurban carriers held off through-freight serv-

Digitized by Google

ice for a considerable time after it became evident that freight must become a necessary and important element of the interurban railway business, simply because the executives of some of the lines could not agree upon the details of a through-freight service," he said. "In some instances they disagreed as to the division of revenue; in others as to furnishing equipment, as to the ability of some of the lines to participate because of lack of power or suitable freight-handling facilities. In many such cases, it never occurred to the fellow who sat in the most favorable position for the operation of through service by being equipped, we will say, with adequate rolling stock, track, power and freight-handling facilities, that he could help his own business by helping the other fellow not so favorably situated, through furnishing more than his proper share of the equipment, power and other requirements for a through service."

President Ackerman pointed to the improvement in relations between the connecting carriers in the Central Electric Railway Association territory as evidence of definite progress and widened opportunity. He urged, however, the need for more general attendance by chief executives at meetings of traffic officers and other groups charged with the direct responsibility of interline relations.

An open-door policy in dealings with the press was strongly urged as a means of bringing about favorable publicity. Direct co-operation by railway executives with the committees on public utility information was held to be another means of stimulating better public opinion. The part which the chief executive may play in maintaining proper contact with the press, public and employees was held by Mr. Ackerman to be one of the most important phases of building better business.

Condition of Track Affects Revenues

Types of track construction most suitable for paved streets were discussed in a paper by W. F. Graves, chief engineer Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., which is abstracted elsewhere. Some fundamentals of track design were covered by A. C. Irwin, manager railway department Portland Cement Association. The relation of track condition to interurban revenues was handled by W. L. Butler, vice-president Cincinnati, Hamilton & Dayton Railway. Abstracts of these papers are printed elsewhere. In each case, the approach to the subject was from the angle of stimulating better business through the improvement of service and facilities.

The need for better track was supported by C. H. Clark, engineer of maintenance of way Cleveland Railway. He outlined the experience with tilted rail in Cleveland during a period of twelve to fifteen years and said that this practice had entirely eliminated corrugation on straight track. According to Mr. Clark, rail laid level on Payne Avenue in Cleveland seventeen years ago had developed corrugations in the first few years, but these had been removed by grinding the rail head to a taper of 1 in 25 and corrugations had not recurred.

The general subject of track noise was commented on by Professor Ewing of Purdue University. The speaker said that the character of construction has little effect upon the volume of noise if the ear is within 3 ft. of the rail. Although different kinds of construction result in a different quality of noise, the volume is about the same at this distance. The noise on the sidewalk or in an adjacent building resulting from a given type of construction was held to depend more upon the character of the street surface than upon the track itself. The man on the street or in an adjacent building hears a reflected rather than a direct noise. If this reflection of sound did not take place, the ordinary noise of street car operation would not be undesirable. As an illustration of the effect of the street surfacing in reflecting sound, the speaker said that careful measurements of noise with special apparatus had shown that open track generates about the same noise as paved track, but since it reflects very much less the net result is a quieter construction.

Regarding the causes of rail corrugation, Professor Ewing attributed much of the existing difference of opinion to the fact that corrugations result from many contributing causes, any one of which may predominate in a particular piece of construction. He held that rail corrugation is not only a rail problem but is just as much an equipment problem. In any given instance both the character of the rail structure and the character of the load which is carried affect the final result obtained. Vertical vibration of moving cars and wheel slippage were cited as contributing causes to corrugation which depend upon the equipment design. Elimination of rail corrugation, according to Professor Ewing, involves two lines of procedure, one of which is the control of the track construction and the other the control of the loads imposed on the rail. Adequate co-ordination of track and equipment construction involves fitting the load and supporting structure to each other so as not to cause deformation resulting from excessive localized stresses.

As a result of the discussion arising in this session devoted to the relation of track to railway business, a special committee was appointed on motion of H. A. Nicholl, general manager Union Traction Company of Indiana, to study and promote the improvement of construction and maintenance practices. A similar committee devoting its attention to distribution and overhead line practices was authorized on motion of G. R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway.

Under the leadership of L. G. Tighe, chairman of the special committee on the promotion of more profitable business, the entire session on Thursday morning was devoted to this topic. In introducing the subject Mr. Tighe questioned the extent and effectiveness to which electric railways are merchandising their service. He held that there are many ways of promoting riding and that effective results cannot be accomplished by merely putting into service improved equipment in the hope that people will ride. "More people are riding today than ever before, but we are not getting our adequate share," said Mr. Tighe. "It is necessary to go after this business if we want it on our cars."

C. L. Van Auken, vice-president and general manager of *Electric Traction*, listed and discussed some of the methods which have been applied by various properties in the effort to increase revenues. Among the practices mentioned by Mr. Van Auken were the better business campaign conducted by the Chicago, Milwaukee & North Shore Railway through its employees, use of 5-cent passes in Fort Worth by the Northern Texas Traction Company, the house-to-house canvass carried on by the Grand Rapids Railway, the selling of rides wholesale to department stores that has been tried in a number of cities, bonuses given to agents Cleveland Southwestern Railway & Light Company, parlor car service operated by the Interstate Public Service Company and various methods used by a number of properties that have actively endeavored to build up chartered bus service. Development of freight business by the Interstate Public Service Company, use of advertising in Birmingham, the development of a golf course for attracting railway riding in Evanston, installation of a bargain fare rate during off-peak hours in East St. Louis, sale of bathing and dancing privileges with interurban rides on the Galveston-Houston Electric Railway, and the sale of coupon books through its employees by the Chicago, South Bend & Northern Indiana Railway were among some of the other efforts to stimulate business listed by Mr. Van Auken.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Sept. 13-15*—International City Managers Association, Dubuque, Ia.**

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Digitized by Google

In the discussion of this subject, L. M. Brown, vice-president Interstate Public Service Company, said that intense personal solicitation is necessary to the development of transportation business in this day and age. Success demands that service be kept right, that equipment be up to date and employees inspired with the need of selling their service. Close personal touch between the management, the employees and the public is essential to success, according to Mr. Brown.

Pick-up and delivery in connection with freight service was held by H. A. Nicholls to be one of the most effective means of stimulating business for interurban lines. He held that the future of the central interurban roads is dependent largely upon the development of freight and express business.

In speaking on the practice of the Chicago, South Bend & Northern Indiana Railway of selling coupon books at a 25-cent reduction over the regular fare, Mr. Green said that this had not resulted in increasing revenues materially but had effectively stopped a decrease which had previously set in. The practice results in the sale of 1,800 books a month and greatly stimulates the interest of both men and superintendents in the welfare of their property. Mr. Green maintained that every new effort to stimulate business is worth while. He said that the general result of such efforts is to improve the morale of men and officials.

The trend of overhead construction was covered in a paper by L. W. Birch, line material engineer Ohio Brass Company, which is abstracted elsewhere in this issue. Written discussions were read by W. L. Margetts of the General Electric Company and L. F. Brahmer of the Westinghouse Electric & Manufacturing Company.

During the afternoons, inspection trips were made by the delegates to various points of interest in Detroit, including the River Rouge plant of the Ford Motor Company and the electrified section of the Detroit, Toledo & Ironton Railroad.

At the evening dinner on Wednesday, W. L. Wilkie, attorney Northern Ohio Power & Light Company, was the principal speaker. He pointed out the need, in dealing with public officials, of recognizing their responsiveness to the public they represent. He explained that public officials are powerless to act in accordance with what they know and believe to be right in dealing with utilities, unless the case has been adequately sold to the public itself.

Cincinnati was selected as the place for the next meeting, upon the invitation of J. B. Stewart, Jr., general manager Cincinnati Street Railway.

The Foundation of Good Interurban Service Is Good Track*

By William L. Butler
Vice-President Cincinnati, Hamilton & Dayton Railway

IN THESE days when so much thought and study is being given to the problems of the electric railways—especially how the revenues may be increased and operating expenses reduced—it is but natural that the question of the proper standards of track maintenance, both as an engineering problem and more particularly with reference to the effect on gross and net revenues, should receive prolonged consideration.

The cost of track maintenance must be reduced to the minimum consistent with true economy. By this is meant not only the lowest attainable cost for the proper maintenance of track, considered by itself, but especially as regards the correlation of that cost to attainable net revenues. We all recognize that it would be poor economy to maintain track at a standard too low to produce a maximum net return and conversely it follows that a management, if challenged, would have difficulty in justifying a standard of maintenance higher than would be warranted to produce the maximum net return, all things being considered.

I am convinced from a number of years of contact with this problem and rather extensive observation of the electric railways of the country—particularly the interurbans, to which I will largely confine myself in this discussion—that a large number of the electric railways are operating at the present time with a subnormal standard of maintenance, a standard that is too low to produce the maximum attainable net return.

Abstract of address before summer meeting Central Electric Railway Association, Detroit, Mich., June 29-July 1, 1927.

Times Have Changed

The financial vicissitudes of the electric railways during the last decade are too well known to all of you to require any extended comment. Most companies are too poor, or feel themselves too poor, to support a very high standard of maintenance. In addition, we have not all realized that the determination of proper standards of maintenance is not entirely an engineering question but varies with the changed conditions under which we are required to operate.

Today we are operating under entirely different conditions than those existing when most of our present interurban lines were built. The horse and buggy have given way to the private automobile. The dirt or poor macadam road has been replaced by modern hard-surfaced highways. Operating over these improved highways a new competitor, the motor bus, has sprung up and in many sections offers formidable competition to the interurbans.

The standard of track construction and maintenance that would provide a reasonably satisfactory transportation service in the days of dirt and poor macadam roads and horse-drawn vehicles will not suffice at the present time in competition with smooth, hard-surface roads and private automobiles whose riding qualities are being improved from year to year with astonishing rapidity. It is not an accident that the automobile manufacturers have spent so much time, energy and money in perfecting the riding qualities of their cars—both the low-priced light car and the more expensive large automobile—through the development and general use of balloon tires, shock absorbers, longer and better designed springs, improved principles of spring suspension, reduction of unsprung weights in automobile chassis and other like improvements. All these improvements are in response to the insistent, popular demand for a more comfortable riding car.

What have the interurban railways done during a like period to meet the public demand for more comfortable service? With a few notable exceptions they have done little or nothing. Their tracks are in no better condition, and in many instances they are in worse condition than they were a decade ago. The Electric Railway Journal has for some years made an annual compilation of data concerning the mileage of track extensions, track abandonments and track reconstruction. Confining ourselves to the matter of track reconstruction, as compared to competitive highway reconstruction, and first calling your attention to the fact that the first data with reference thereto was printed by the Journal in 1917, we find that there were reconstructed 5,637.78 miles of track in the United States in the ten years from 1917 to 1926, both inclusive. According to the federal census of 1922, the total mileage of track operated by electric railways was 43,931.86 miles. The change in track mileage from 1922 to 1926 was not material, the extensions, reported by Electric Railway Journal, approximately offsetting the abandonments. It would thus appear that in the decade ending with 1926, of the total track mileage of the electric railways of the country 12.8 per cent was rebuilt or approximately 1.28 per cent per annum on the average. At this rate it would require approximately 78 years to rebuild all of the electric railway track operated at the present time.

113-Year Reconstruction Schedule

The first data reported by Electric Railway Journal for interurban track mileage reconstruction (as distinguished from city track mileage reconstruction) was for the year 1919. In the eight years from 1919 to 1926, both inclusive, there were reported to have been reconstructed 1,254.58 miles of the total interurban track mileage of 17,807.93 reported by the 1922 federal cen-

Digitized by Google

sus. The annual reconstruction during this period averaged 0.88 per cent per annum. At this rate it would require over 113 years to reconstruct all the interurban track mileage operated in 1922 without regard to the fact that in this period of reconstruction of over a century it would be necessary to rebuild some of the mileage reconstructed in the earlier years.

It may be that the data and comparisons herein set forth are advisory rather than mathematically accurate. It is quite possible that these data, although compiled by ELECTRIC RAILWAY JOURNAL with care and thoroughness, do not reflect all track mileage reconstructed. Even though the error were considerable, the showing is so shockingly inadequate as to leave no doubt in any one's mind that most of the interurban electric railways are wearing out their tracks without adequate provision for reconstruction.

It will, of course, be argued that interurban track differs from city track in that it is not rebuilt in its entirety, but is usually renewed piecemeal year by year. This piecemeal reconstruction work consists almost entirely of the renewal of ties, ditching and lining and surfacing, which is in the nature of track maintenance. If the data were available, we would find that very little ballast was renewed on the interurbans of the country as a whole and that rail renewals were an insignificant percentage of the total rail tonnage in the tracks. All that the interurbans are doing is to maintain, after a fashion, the same track which was constructed 20 or 30 years ago. In other words, the interurban highway, which is fighting a losing battle in competition with concrete and other hard-surfaced roads, is at best the same highway that was built and operated in old Dobbin's day.

INTERURBAN TRACK PROGRESSIVELY DETERIORATING

As a matter of fact, the interurban highway of today is not as good as it was twenty years ago. Insufficient maintenance and neglect, whether forced by inexorable economic or other conditions, has irreparably damaged a large percentage of the rail. It has become battered and surface-bent and in most cases cannot be put into satisfactory condition except by complete renewal. The situation as regards such trackage is quite similar to that confronting the highway engineer called upon to restore to good condition a neglected hard-surfaced road full of holes, waves and depressions.

Turning for a moment from the condition of interurban railway tracks to that of the rolling stock, according to statistics compiled by ELECTRIC RAILWAY JOURNAL, there were built during the twenty years from 1907 to 1926, 10,044 interurban cars, of which 2,705 were constructed during the last decade. From the same authority we learn that there were all told 14,752 cars in interurban service at the end of the year 1924.

It thus appears that slightly more than two-thirds of the interurban cars of the country have been built within the last twenty years. Only 18.3 per cent of the interurban cars, however, have been constructed during the last ten years. It is very clear that the replacement of interurban cars has fallen below a reasonable level during the last decade. At the rate at which new cars were constructed during that period, it would require almost 55 years to replace the interurban passenger equipment now in use.

In the light of these comparisons, which seem to indicate that interurban track reconstruction is proceeding upon the basis of a 113-year cycle and that interurban car replacements are being made on the basis of a 55-year cycle, assuming a stationary volume of traffic, is there any wonder that the public is being weaned away from the use of the interurban as a means of passenger transportation? All too many of us are in the position of a merchant doing business with fixtures which were modern in his father's day and selling merchandise which was in vogue in the days of the bustle, long trains and leg-o'-mutton sleeves.

NEW CARS NOT ALONE SUFFICIENT

Many are prone to forget that that foundation of good service is good track. New cars are quite necessary, but they do not constitute a panacea for all ills. A new car will prove no more satisfactory to the traveling public when operated over poor track than a 1927 automobile if operated over poor highways, full of holes and ruts. It may not be as fashionable, but it is certainly more comfortable and less aggravating to ride in a rattling "Lizzie" over a smooth concrete road than in a luxurious, expensive limousine over a rough highway. It is a matter of common, every-day observation that automobile drivers shun a highway in poor condition and will go miles out of their way to use a road in perfect condition. A part of this phenomena is to be explained by the desire for speed, but the basic reason is the insistence upon a comfortable ride.

Viewing the interurban situation as a whole, there are some properties that should never have been built and which will drag out their existence to an inglorious end. Others are on the border line where there is serious question as to whether sufficient business can be developed to justify the new capital required. But a large percentage of the interurban mileage in the country has a real field of usefulness. A large proportion of these properties at the present time are making very disappointing financial showings. The question that is uppermost in our minds is whether the results would justify whatever sacrifice might be involved to the present owners, if these properties were modernized and thoroughly rehabilitated. With properties that have potentialities there appears to be no question but that every dictate of self-interest should prompt their owners thoroughly to rehabilitate and modernize trackage and to re-equip the properties with equipment and power facilities of the most modern type.

MODERNIZATION PAYS

My association with the Chicago, Aurora & Elgin Railroad from 1922 to 1926 permitted me to witness the result of an experiment demonstrating the results which follow the thorough reconstruction and modernization of an interurban property possessing economic potentialities. In the spring of 1922 an extensive track rehabilitation program was inaugurated. While it was announced at that time that additional new equipment had been ordered, new substations were about to be constructed and other extensive changes were to be made, the fact was that until August, 1923, the only substantial change in the physical condition of the property was the execution of an ambitious and thorough program of track reconstruction and betterment.

Almost immediately after this program was launched a marked increase in passenger revenues occurred. In the year ended July 31, 1922, prior to the track rehabilitation work, the increase in passenger revenues was only 0.4 per cent over the previous year. In the twelve months ended July 31, 1923—the first year following the completion of the track rehabilitation program—the passenger revenues were 15.3 per cent in excess of those of the corresponding period of the preceding year. In the succeeding twelve months, when additional new rolling stock was in operation throughout the period, an additional passenger revenue increase over the preceding year of 7 per cent was obtained.

This track rehabilitation program did not merely consist of the replacement of ties and the realignment and resurfacing of track. It involved an almost complete reconstruction of track. Old ballast was used to provide a firm subgrade and on top of this new ballast of ample depth was placed. All necessary tie renewals were made. Rail joints were replaced on a large percentage of the property, and a considerable mileage of rail, which was so battered and bent as to be incapable of further satisfactory use, was relaid.

We found, some two years after this rehabilitation program was completed, that our maintenance of way expenses in the twelve months ended May 31, 1925, were 19.9 per cent less than in the twelve months ended May 31, 1922, despite the fact that in this period our car-miles had increased almost 20 per cent. This emphasizes one of the lessons which happily we can all learn concerning the advantages of high track standards—that it is actually less costly in most cases to maintain in first-class condition a well-constructed track than it is to maintain in indifferent condition present-day average interurban track.

We also found on the Chicago, Aurora & Elgin that despite higher wages we were able to reduce the cost of maintaining equipment per car-mile to 65 per cent of what it had cost three

Digitized by Google

years previously before track and equipment had been rehabilitated. In the same period car failures per 100,000 car-miles were reduced from 9.6 to 7.9 or 18 per cent. A substantial part of this reduction in maintenance of equipment costs—which please bear in mind occurred while a vastly improved standard of maintenance was established—must be attributed to the lesser wear and tear on equipment with track in first-class condition.

It may interest you to know that the increase in railway operating revenues in 1925 over those in the twelve months ended June 30, 1922, was 65.8 per cent; that the increase in net railway operating revenues for the same periods was 154.4 per cent, and that the balance remaining for the stockholders, after fixed charges and larger deductions for depreciation, increased in these periods from $126,487 to $319,966, or 153 per cent.

Within the last few days, the Cincinnati, Hamilton & Dayton Railway has put into service new interurban and urban types of equipment, and in preparation therefor, and as a means of further stimulating business, has been steadily at work for the past year and intends to continue progressively to improve its interurban and city track standards to the end that it may be in a position favorably to compete with parallel hard-surfaced highways. We feel confident that this expenditure will be productive of a substantial increase in passenger revenues—resulting from the constantly increasing attractiveness of our service. During the calendar year 1926 passenger revenues were more than 6 per cent above 1925.

All of the interurban properties that have made progress during the last few years have given proper attention to the establishment and maintenance of high track standards. The only properties which are successful are those that are modern and in first-class condition. In my opinion, the foundation of good interurban service is good track, and that without good track it is, generally speaking, impossible to make a financial success under present conditions of operation.

Some Fundamentals of Street Railway Track Construction

By A. C. Irwin
Railways Bureau, Portland Cement Association

DEVELOPMENT of most of the appliances that have done most to further the upward progress of humanity has usually started and reached considerable proportions before any scientific analysis or rational design of them has been attempted. This is true, particularly, of that most important portion of the physical property of railroads, namely, the track structure. Only recently has the problem been approached as something that could be evaluated in engineering terms, and at the present time there is very little in print to indicate that engineers have undertaken to solve the question of track construction in the same way that they would design a bridge or a building.

It was early in the history of track construction when cross-ties carrying rails became the only type in use. The cross-ties served two obvious purposes, namely, to distribute the load to the earth and to hold the rails or contact lines to proper gage and in proper position. We thus have the two fundamentals of track construction, first, the line of contact for the wheels and, second, a supporting structure to distribute the load on these contact lines to a more or less yielding base or foundation. If the contact lines (rails) were perfectly smooth, perfectly straight and perfectly level, supported throughout their length by an unyielding base, and if the wheels of the rolling stock were perfectly round, cars would pass without vibration or swaying or bumping. This condition might be likened to that of a perfectly smooth and perfectly round ball rolling over an absolutely plane surface. An approach to these ideal conditions is practicable, and the following requirements are fundamental if what may be termed good track is to result:

1. The entire track structure must be supported on a foundation that will hold it to proper surface.

2. The line of contact (rail) must be hard and strong.

There is only one reason why railroad track gets out of surface, and that is that the foundation is not strong enough to support the loads put upon it. In other words, track construction is not given anywhere near the stability that is demanded for a bridge or a building of even minor character. The fact that the rails of a car track become low with respect to the adjacent pavement surface proves just one thing, that there is an inadequate engineering structure supporting those rails. Ties spaced at customary distances under rails and supported on loose stones or gravel or earth or what not can never be expected to furnish a construction that will not need a great deal of maintenance if subjected to heavy traffic. Such maintenance results simply because the ballast and ties do not spread the loads over a sufficient area to prevent settlement.

The first and fundamental of street car track construction is a foundation of adequate strength to spread the load over a sufficient area of the subgrade so that the bearing power of that subgrade will not be exceeded. This is especially necessary where track is in paved streets. Sometimes with exceptionally favorable subgrade conditions such a foundation can be had by the use of the ordinary wood tie and ballast, but in paved streets such construction can be justified only where previous experience has shown it to be adequate. Even then it may not prove successful because of increased loads and unusual weather conditions.

No marked increase in weight of cars or of wheel concentrations may be expected in the near future, but the load placed upon the pavement and, hence, the track by trucks is another matter. Ordinarily, street car tracks are not laid in boulevards, from which heavy trucks are excluded, but in those streets that are open to them. The loads on motor truck wheels often exceed those of the electric cars. Many city and state regulations for the design of bridges require the design to be made for 20-ton trucks with 80 per cent of the load concentrated on the rear axle. It is easy to see that 16 tons on a motor truck axle produces more load on a car track than does a 40-ton car whose weight is distributed among four axles. Moreover, when motor trucks cross tracks there is always a bump that greatly increases the load effect on the track substructure. This substructure must therefore carry not only the electric car loads but also the greater ones of motor trucks.

Rigidity and Strength Necessary

A corollary to the need of adequate strength in the track substructure is rigidity. Regardless of who maintains the paving in the car track zone, sound engineering demands that there be no movement in the car track sufficient to destroy the paving. Rigidity, therefore, results from satisfying the fundamental of adequate strength and is also necessary for preservation of the pavement. It has always seemed to us that whatever disadvantages attend the use of a strong, rigid type of car track construction must be put up with in so far as they cannot be mitigated without violating the fundamentals of strength and rigidity.

Noise and rail corrugation have been charged to rigid construction. Testimony as to how much of these objections are chargeable to rigid track is conflicting. A low, steady rumble can be scarcely less objectionable than the metallic bang at low joints, the squeak of brakes, grind of the gears, the clang of wheels set in vibration by sidewise swings against the rails. So long as there are metal wheels on metal rails and a volume of air between the car floor and pavement surface there will be noise. If this noise merely changes to a deeper tone, lower in the pitch scale, it does not become more objectionable on that account.

Rail corrugation has sometimes been

*Abstract of a paper presented at the summer meeting, Central Electric Railway Association, Detroit, Mich., June 29-July 1, 1927.

Digitized by Google

charged to rigid construction. However, such evidence as we have does not support this conclusion. Corrugation occurs without apparent rhyme or reason —sometimes on ballast supported track, sometimes on rigidly supported track. Very often it is worse at rail joints. Whether corrugation is started by very small ridges in new rail left by the rolls or whether it is started by vertical vibration or bumping of the wheels along the rails induced by something other than surface imperfections of the rail is a moot question. Perhaps the answer will be found in unsprung loads of equipment or in the car wheels themselves. Perhaps the application of brake shoes to the tread of the wheel produces flat spots that induce corrugations.

In the light of the fundamental requirement of stability in car track construction, such features as ties, rail joints, joint filler, etc., become details, important of course, but always dependent for their successful use on their addition to the strength of the track structure.

When an engineer designs the foundations for a bridge or building he gets together all available information about the bearing power of the material that must carry the structure and then easily works out the width and depth of the foundations from the load they will have to carry. Do we design a street car track structure in the same way? Of course, the problem of how wide the base of a street car track should be depends not only on the bearing power of the subgrade but on the loads and their distribution longitudinally as well. If we knew these things for a given case the design would be simple. We believe that this association, in order to be of most service to its membership, should have a committee investigate and report on the design of street car track structure from a theoretical and practicable standpoint.

Some Problems of the Track Organization*

By W. F. Graves
Chief Engineer Terre Haute, Indianapolis & Eastern Traction Company

ONCE a track is constructed in a paved street its maintenance resolves itself into one of paving maintenance. Concerning the type of track which is best suited for use in paved streets there is as much divergence of opinion as there is divergence of types. Some believe in a foundation which may absorb shocks of moving loads, others in a type that is as near rigid as a monolith can make it. Some engineers are advocates of steel ties, combinations of steel and wood, concrete, etc., and many more of a substantial wood tie. I do not believe the design of modern types of track has advanced a great deal over those in use many years ago. In the United States Patent Office there are filed 895 patents on substitute ties of various kinds. Of this multitude three or four are being marketed, commended by some and condemned by others. The rail for track in paved streets has been fairly well standardized already by the A.E.R.E.A. and American Railway Engineering Association during the past five years. Of the grooved girder type the American Electric Railway Association has several very excellent standards, but while the work of the way committee of that association was being done on these standards, a period of perhaps five or six years elapsed, and in that time came the practical disappearance of the horse-drawn, steel-tired vehicle, which had a very large influence in the adoption of the grooved girder rail design. The growing preponderance of automobile rubber-tired vehicles made the practicability of those designs of questionable value. Also the perfection of concrete pavements, the very much more desirable type of joints on the T type of rail and elimination of opposition on the part of the public to the T-rail led many larger properties to use the low T-rail instead of the more expensive grooved girder rail.

Throughout the Middle West most of the large city street railway properties are also operating interurbans. The tendency of street car design is toward lightness but owing to necessary high speeds the weight of the larger interurban cars has changed very little. In fact, in some localities the introduction of sleeping, parlor and dining cars has tended to increase the weight. But the track foundation, rail design and particularly the design of special trackwork has undergone very little change, and we track engineers and, I might add, the managements, of these street and interurban properties are apathetic toward this situation. There is even a tendency to go to the lighter types of track in paved streets, probably due to first costs. These remarks are particularly applicable to the territory of the Central Electric Railway Association.

Relief from Paving

There is a tendency among state and municipal authorities to relieve the electric railways of the burden of paving the track space; in fact, on our property we do no paving of any nature and only maintain a reasonable surface where necessary to make repairs on account of track troubles. This paving matter has been the subject of many bitter controversies with the municipalities, but we have maintained a firm stand in spite of any provision to the contrary in our original franchises, which were surrendered when taking advantage of the public utilities indeterminate permit act in Indiana, and in all our contact with the public, public bodies, chambers of commerce, city councils, etc., we have taken pains to make our problem perfectly clear, and I believe in almost every case have convinced them of the injustice of the paving burden on the railways. Many court decisions have recently been rendered on this subject, mostly favoring such relief. Attention is called to an article in *Aera,* on page 507 of the May, 1927, number, which contains a digest of recent court actions. But the Supreme Court of the United States in a recent decision concerning the Fort Smith Light & Traction Company of Arkansas, in a paving case, rather took the opposite stand.

We advocate no particular type of paving, but construct the track which we feel is best suited for railway purposes and not paving, except that we do advocate concrete track foundation. A large part of the time of the speaker and of the general superintendents, general manager and general attorney is taken up with the various municipalities combating the imposition of this extra tax and trying at the same time to maintain, at least, a respectable feeling toward us.

Unfortunately in many cases the railways oppose public improvements without sufficient excuse, and some municipalities cannot help wondering why we can and do reconstruct track in the neighboring town and not in theirs. This feature is sometimes hard to explain, and as we are usually on the defensive in these matters, we sometimes make ourselves ridiculous. The important answer is always to maintain friendly and frank relations with the public and public bodies.

Improving Labor Conditions

Much may be said of the relations with the labor employed in maintenance of way and construction departments. The ideal track organization for both street and interurban railways is sectionalized; that is, the property is divided into small units, each with the proper number of men and proper supervision so that the foreman or supervisor becomes familiar with the smallest detail of his unit, as it is the small troubles with both track and overhead that annoy the operating departments. Any work of major proportions to be taken care of by floating extra gangs. Coupled with adequate supervision on up the line, this makes for smoother and more efficient operation and has a marked tendency to be pleasing to the general public by lessening the cause of noise, dust delays and other complaints, which are all too numerous. I can assure you that in these days of keen competition and too much transportation good public opinion looms large.

As to efficiency in the track maintenance organization, excessive labor turnover due to tearing down in the fall and building up in the spring is a large factor. As to labor output per man it

Abstract of a paper read at the summer meeting Central Electric Railway Association, Detroit, Mich., June 29-July 1, 1927.

Digitized by Google

would be both economical and tend to efficiency and individual interest to maintain throughout the twelve months a regular and trained force of men and supervisors, as the training each year of new and untried men is a matter of serious financial cost, but unfortunately not susceptible of being shown in dollars and cents.

Another thing which would make for economy and efficiency would be the grading of rates of wage. Under the present general practice a man starts as a track laborer at a fixed starting rate of wage. At the end of the term of service he is still at the starting point, regardless of his interest in or ability to do the particular work assigned to him, unless perchance he, through push, personality or favoritism becomes a foreman or supervisor. We are too apt to consider labor as a purchasable commodity. But each of these men is a force in his own community and can make friends for the corporation or otherwise as he is satisfied or dissatisfied, and it is particularly among this class from which the majority of our revenue comes.

On our property the grading of the rate of wage is based not only on length of service but on efficiency and output. Giving continuous employment throughout the year would result in an estimated increase in payroll of $12,000 or 5½ per cent, which might be applied to the cost of training men and obtaining loyalty and efficiency. We reward our foreman and supervisors each year with a small bonus, based on an annual inspection by the general officers, to which we devote three or four days. This inspection is of considerable value in acquainting the general officers with what has been going on during the year as well as permitting the men to become acquainted with the officers and what they have been doing, but there is no reward or recognition of the rank and file except an inherent pride in doing a thing well enough to warrant bringing recognition to his foreman or supervisor, and we are now working on a system that we hope will overcome this fault.

Minimizing Street Dangers

Another thing is the safety of our track employees. Accidents are in large measure due to excessive labor turnover. A couple of years ago we began teaching and preaching safety at our trackmen's meetings, of which we have one each month on each divison, and a supervisors' meeting twice a month. These meetings were attended by the claim agent and addressed by him, with the result that the track department showed a decrease in accidents of 30 per cent from the preceding year.

Our property being mostly interurban, our men are not so subject to street accidents, but even in the cities in which we operate the men suffer, some from being struck by passing automobiles in spite of precautions to protect them, such as red lights, flags and on busy streets a watchman maintained to warn the workers. The marked reduction in accidents is directly the result of the teachings in these trackmen's meetings and constant surveillance on the road.

Co-operation and interest should be maintained among the men and it is really surprising how readily they respond to a little individual attention and recognition. Their loyalty is fostered and strengthened. They like to know in a general way what becomes of their daily reports, tool inventories, various individual reports and complaints, the operation of other departments with which they come in contact, how and why they have so many accounts and job or work order numbers to do with. Once each month a meeting of the division foremen is held at the supervisors' headquarters and twice each month we bring the division supervisors to Indianapolis, give them all a luncheon and usually discuss track and maintenance subjects. These meetings are attended at specified times by the auditor, the general and division superintendents, and the claim agents. Matters common to those departments are fully and freely discussed as well as track matters. We also have joint meetings between the line and track supervisors. We conduct also a school of applied electricity presided over by a professor from Rose Polytechnic Institute, which has been largely attended because it is conducted in language the layman can comprehend. By these meetings we believe we have raised the morale and interest of the men.

Distribution of Costs on Automotive Equipment*

By M. Zass
Assistant Superintendent of Rolling Stock
Milwaukee Electric Railway & Light Company

TO BE proper an automobile and motor truck accounting system must necessarily accomplish two things: First, it must provide for the accurate and simple accumulation of all costs of operation; second, it must provide a means of properly distributing such costs over the various accounts which have received the benefit of the operation of the various pieces of equipment.

In order that costs can readily be accumulated we should have a special account into which is charged all costs of operation and maintenance of automobile equipment. So that we may know at the end of the month, in general, what expenditures have been for, and thus gain better control of the account, as well as aid in the management of the maintenance and operation of the fleet, the costs should be classified into several components of similar nature. For ordinary operating conditions the following divisions ought to be sufficient:

1. Superintendence.
2. Maintenance and Repair of Equipment.
3. Gasoline and Oil.
4. Tires and Tubes (replacements and repairs).
5. Cleaning and Washing.
6. Tools and Miscellaneous Expense.
7. Power, Light, Heat, Water, etc.
8. Maintenance of Buildings, Fixtures and Grounds.
9. Fixed Charges.

These divisions of the automobile special account are merely arbitrary and can be added to or combined as local conditions and the size of the fleet may require. For each of the divisions which we find necessary and expedient to make, we should, of course, carry a sub-account, so that charges for labor and materials can be properly classified and allocated.

Sub-account No. 1, Superintendence, is rather self-explanatory. To this sub-account should be charged all supervisory labor, such as garage foreman's salary, assistant foremen, clerks, stenographers, timekeepers, etc., and office expenses. Where the fleet is small, naturally the supervisory force is likewise small, and in some cases perhaps only a portion of one man's time would be properly chargeable.

Charges to Maintenance

Into Sub-account No. 2, Maintenance and Repair of Equipment, should be charged all labor and material expended in the inspection, repairing and overhauling of equipment. This sub-account will, undoubtedly, show the bulk of the total cost in the account, and if further refinements are desired it may be split up to show, for instance, cost of engine and chassis repairs, body repairs, painting, etc. This is entirely optional and local conditions and size of fleet again govern.

The purpose of the next five classifications, namely, No. 3, Gasoline and Oil; No. 4, Tires and Tubes; No. 5, Cleaning and Washing; No. 6, Tools and Miscellaneous Expenses, and No. 7, Power, Light, Heat, Water, etc., are so self-evident that they perhaps do not require any further detailed explanation.

Sub-account No. 8, Maintenance of Buildings, Fixtures and Grounds, should be charged with the maintenance of garage buildings and equipment usually considered a part of the building, such as the heating plant, steam, water and air piping, plumbing, etc. If the building is owned, a rental charge should be set up, and if the building is a rented one, then, of course, the rental cost should be charged to this account. If the building is owned, the rental charge set up should be adequate to cover in-

Abstract of paper presented before a meeting of the accounting section, Wisconsin Utilities Association, Green Bay, Wis., June 17, 18, 1927.

Digitized by Google

terest, depreciation, taxes and insurance on the building. If it is a rented building, then the rent paid, naturally, covers such fixed charges.

Sub-account No. 9 covers fixed charges. This has reference to fixed charges on the automobile equipment only, and not on buildings, fixtures and grounds, as covered in the previous sub-account. Under this title of "Fixed Charges" are included:

(a) Interest on the investment.
(b) Depreciation.
(c) Taxes.
(d) Insurance.
(e) Injuries and damages.

Thus far we have an outline of an automobile special account that would give us a cost of a fleet of automobiles and trucks divided into nine general subdivisions or classifications indicating the nature of the expenditures made. With the operation of but a fleet of cars all of the same make and capacity it would be a relatively simple matter to determine the average cost of operation and maintenance per car, either on the basis of cost per mile or cost per hour or per day. But where we have more than just a few pieces of equipment, we will usually find a number of different kinds and capacities of automobiles and trucks, each best suited for the particular kind of work for which it is especially required. This, then, makes our accounting problem more complex, and especially so where there are a large number of different kinds of equipment.

Allocating Maintenance Costs for Individual Equipment

It is necessary, for a number of reasons, to know what it is costing us to operate and maintain a certain piece of equipment, or a group of certain similar kind of equipments, and our special account must produce this information. In order that this may be accomplished, it will be necessary further to subdivide our special account so that a cost will be found for each vehicle, or each group of vehicles of similar make and capacity. With a small fleet of cars it can readily be arranged to show the cost of each individual piece of equipment, and, where this is done, the results should prove, over a period of time, a good index as to whether or not such a vehicle is economical to continue in service, or whether it should be scrapped or traded in for new equipment. This will work out all right with a small group of cars, not exceeding 25 or 30. Where the number of cars is greater, this method becomes somewhat cumbersome because of the large number of sub-accounts and the resultant amount of clerical work necessary to the detail posting.

In a large fleet there will usually be found a number of similar make and size of vehicle which may be grouped together, and we can arrange our account to show a cost for a certain group of similar cars or trucks, rather than for each individual car or truck. It is very true that some particular unit in a group, by reason of age or condition of service, may cost more or less to operate than others in the same group, and by keeping a group cost, we lose the advantage, previously pointed out, of being able to determine the operating efficiency of a particular unit. However, where a large fleet is operated, some other means is usually provided by which the operating efficiency and economic life may be determined. From the accounting standpoint, and for the purpose we have in mind, it should be sufficiently accurate to use an average cost of a group of cars or trucks. Such an average cost would be determined either on a mileage basis and expressed as a certain cost per mile operated or it may be determined as a cost per hour or per day operated. Whatever method is used is contingent to some extent on how we intend to make our distribution of costs, and that leads us into the consideration of the second requirement of our special account mentioned at the beginning of our paper, namely, that it must provide a means of properly distributing costs over the various accounts which have received the benefit of the operation of the various pieces of equipment.

Distribution of Items in Special Accounts

There are several methods by which the accumulated costs in our special account may be distributed over the accounts which are properly chargeable and which received the benefit of the operation of the equipment.

Theoretically, our object should be to distribute exactly all costs of operation and maintenance into the various accounts receiving the benefit of the service rendered by the equipment and in exact proportion to the amount of service rendered. This would be ideal, but it would require entirely too much bookkeeping and clerical work to accomplish. We must, therefore, find a more simple way of doing this and yet have the ultimate results reasonably correct.

One method would be to distribute the costs as an overhead. While this method may be the easiest one to do, it is by far the least accurate or desirable and is not recommended.

Another method would be to distribute the costs on the basis of cost per mile operated. This is a great improvement over the previously mentioned method, but it still has some undesirable features, as, for instance, take two trucks of similar make and capacity. The cost of operation and maintenance would naturally be very nearly the same for each truck, and consequently the rate per mile at which the service of these trucks would be charged out at would, likewise, be the same for both trucks. One truck may be assigned to a job on which it would be employed continuously throughout the day but would make but very little mileage, while the other truck would be assigned to a job on which considerable mileage is made. It will be seen, then, that if the use of the trucks were charged out on a mileage basis, the charge for the use of the one truck making the small mileage might be considerably under the actual cost, while the charge for the other truck might be too high.

A more equitable method of distribution will be found in the hourly or daily basis, making a charge of so much per hour or so much per day for the use of the automobile or truck. This is by no means proposed as an absolutely accurate and perfect method, as it can be argued that such costs as repairs, gasoline and oil, and tires are governed entirely by mileage actually made by the vehicle. On the other hand many of the other component costs in our special account are measured on a time basis. Trucks hired on the outside are usually charged for on the hourly or daily basis and, all things considered, I believe you will find the hourly basis as the one most satisfactorily serving the purpose.

The determination of the rate per hour to be charged for the various pieces of equipment is perhaps the most difficult thing in the whole proposition. To obtain a reasonably accurate figure it is necessary to use at least a year's cost figure as a basis where possible. If you have decided to keep your costs by groups of similar equipment, then, of course, the total cost for the whole group should be the basis for determining the cost per hour and such a cost per hour would apply to each vehicle in the group whether it be new or old.

Hour Rates Should Be Checked Periodically

The rates per hour ought to be checked at least every six months to determine whether they are adequate to cover actual costs and to adjust any rates which may be found to be either too high or too low, the idea being, of course, that the charges made for the use of the automobiles and trucks, and which are entered as a credit in the special account, will be sufficient to balance the charges for operation and maintenance. It is impossible, of course, to balance the charges exactly each month for the reason that some months may show rather high maintenance charges due to considerable overhauling work, or other reasons, while other months may be lower, while the charges for the use of the trucks (which would appear as credits in the special account) would be a fairly constant figure, as it should be.

There is but one thing further that the accountant will have to have to complete the mechanism of this special account and that is a monthly report or statement from the operating department which will indicate the number of hours each truck or automobile was used and the particular work or job on which it was used, together with the charge account number for such work, so that the proper completing entries may be made. The form and manner in which this information is gathered will have to be left to you, as conditions and circumstances on your properties will govern the method used.

1,500 at New York Railroad Club Outing

BASEBALL, golf, tennis, running and track events occupied the attention of nearly 1,500 persons who took part in the annual outing of the New York Railroad Club on June 30 at Travers Island, N. Y. A special train on the New York, New Haven & Hartford Railroad took members to the grounds of the New York Athletic Club. A buffet lunch was served on the arrival of the train and in the evening over 1,000 persons enjoyed a shore dinner.

The electric railways in the New York district were well represented in the delegation. William G. Gove, president of the Railroad Club, being an electric railway man naturally drew out a good representation of his associates. Those who played golf went out early in the morning and played at the Wing Foot Golf Club at Mamaroneck until noon. Rain in the morning dampened the clothes of some of them, but did not dampen their ardor. The baseball game, which started at 2:30 p.m., was won by the publicity department team of the New York Central Lines. Their opponents were a team from the New York *Times*. Sixty-one men entered seven track events and several heats were necessary in almost every event. Perhaps the most hotly contested event of the day was a meeting at quoits between Frank Hedley, president of the Interborough Rapid Transit Company, and W. S. Menden, president of the Brooklyn-Manhattan Transit Corporation. It was reported that the B.-M.T. president was in the lead when the game was adjourned for dinner.

Model for Municipal Traffic Control to Be Drafted

PREPARATORY to drafting a model municipal traffic ordinance eighteen members of a national conference representing all classes of highway users, as well as enforcement officials named by Secretary of Commerce Herbert Hoover, met in Detroit on July 6. The movement was instituted on June 17 last when William E. Metzger, Detroit, was appointed chairman of the National Conference on Municipal Traffic Problems. The purpose of the meeting was to name chairmen and vice-chairmen, and to advocate work to be carried on during the summer months. Active work toward the preparation of the code is to be carried on through six sub-committees, each of which will draft sections of the code pertaining to specific subjects for discussion the latter part of the year at a meeting of committee chairmen in order to eliminate duplication in recommendations. After this meeting the reports will be published in tentative form for constructive comment by interested parties. In addition to suggestions for wording of the various sections of the ordinance, these reports will contain much information that can be used for educational purposes in helping to stimulate interest and show the necessity for the recommendations made. This educational work can be of much help in showing the necessity for uniformity in handling local traffic in widely separated cities even though within the same state.

Special study will be given to the question as to the extent to which exact or substantial uniformity in the traffic provisions is possible and desirable, and in what features of the traffic ordinances and regulations there must be flexibility to meet local conditions. Other questions to be considered pertain to what matters should be left to the state law and what should be covered by neither state law nor municipal ordinance but by supplementary regulations that can readily be changed as traffic conditions require. Chairmen and vice-chairmen of committees named are:

Vehicle Movement and Regulation, Dr. Miller McClintock, Cambridge, Mass., chairman, and H. D. Brown, Detroit, vice-chairman.

Pedestrian Facilities and Regulation, James L. Madden, New York, chairman, and C. W. Stocks, New York, vice-chairman.

Traffic Signs, Signals and Pavement Markings, W. B. Powell, Buffalo, chairman, and B. W. Ryark, Chicago, vice-chairman.

Parking Terminals and Garages, Robert E. Hooper, Philadelphia, chairman, and F. L. Wetland, Cleveland, vice-chairman.

Public Motor Vehicles, Including Street Cars, Buses, Taxicabs and Fire and Ambulance Emergency Vehicles, A. C. Godward, Minneapolis, vice-chairman.

Traffic Organization and Enforcement, S. J. Williams, Chicago, chairman, and G. W. Elliott, Philadelphia, vice-chairman.

Electric railway men named include E. J. McIllraith, staff engineer Chicago Surface Lines, on the committees on traffic signs, signals and markings and on parking, terminals and garages; R. J. Senter, president Philadelphia Rapid Transit Company, and H. B. Flowers, president New Orleans Public Service, Inc., on the committee on parking; Lucius S. Storrs, managing director American Electric Railway Association, and Arthur M. Hill, secretary and treasurer Charleston Interurban Railroad, on the committee on buses, street cars and emergency vehicles.

American Association News

Engineering Nominations

NOMINATIONS for officers of the American Electric Railway Engineering Association for the association year beginning October, 1927, have been made by the nominating committee as follows:

President—R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C.

First Vice-President—Frank H. Miller, vice-president and general manager Louisville Railway, Louisville, Ky.

Second Vice-President — Willard F. Graves, chief engineer Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

Third Vice-President—W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore, Baltimore, Md.

Secretary-Treasurer—J. W. Welsh, executive secretary American Electric Railway Association, New York, N. Y.

Members of the Executive Committee—L. D. Bale, superintendent of power Cleveland Railway, Cleveland, Ohio; Charles H. Jones, general manager Chicago, South Shore & South Bend Railroad, Michigan City, Ind. P. V. C. See, superintendent car equipment Northern Ohio Power & Light Company, Akron, Ohio; F. McVittie, electrical engineer New York State Railways, Rochester, N. Y.

The report is signed unanimously by the nominating committee, consisting of Charles R. Harte, A. T. Clark, H. H. George, H. A. Johnson and C. A. Smith.

Wood Preservation

ON JUNE 8 a meeting of the committee on wood preservation of the Engineering Association was held at association headquarters in New York. The following were present: C. A. Smith, chairman; W. H. Fulweiler, E. F. Hartman, M. J. Curtin.

The report of sub-committee No. 1 on "Review of Existing Manual Sections for Revision and Correction" recommended a number of changes in Manual Section WP120-26. Other changes were recommended in Manual Sections WP106-26 and WP104-26. A new specification for the open-tank treatment of poles will be submitted. The committee approved the entire subcommittee's report. Progress reports of each of the other sub-committees were considered and commented upon. In some cases suggestions for changes were made and these will probably be incorporated in the final report.

Metro Section Will Go to Luna

WHEN the third annual outing of the Metropolitan Section, A.E.R.A., is held on Tuesday, Aug. 16, one of the features of the program will be an evening trip to Luna Park, Coney Island. Members of the section will be guests of Barron Collier at the park. Athletic events will be held during the day at the grounds of the Crescent Athletic Club, Bay Ridge, Brooklyn. The program includes an eighteen-hole golf putting contest at 9 a.m. and other events during the afternoon. There will be a hundred-yard dash for thin men, and a fat man's race for those weighing 220 lb. or more, a tug of war between the railway and supply men, a hop, skip and leap competition, as well as wheelbarrow and sack races. A baseball game will be played between the railway men and supply men. Old timers can amuse themselves pitching quoits. Dinner will be served at the club at 5:30 p.m. After distribution of the prizes for the athletic events, transportation will be provided from the club grounds to Luna Park.

Chicago Still Hopes

City Council calls first meeting to speed new plans for traction settlement —Need for temporary grant

Willingness of both local transportation executives and city officials of Chicago to accept the offer of Governor Len Small to call a special session of the Illinois Legislature next fall if the city and companies can agree on an ordinance and the kind of legislation they want was indicated during the week commencing July 5 by the response to a call issued by Chairman Joseph B. McDonough of the City Council local transportation committee to begin work immediately on a new traction settlement program.

Realizing that the only hope for the bills lay in the support of the Governor, proponents of the measures turned to Governor Small at the eleventh hour. He expressed the belief that the enabling legislation is needed, but refused to make any promises about a special session. He appeared to desire a public referendum on the question of franchise duration in advance of the passage of the indeterminate permit bill, instead of after the legislation was obtained as proposed by the companies.

With the 33 amendments attached in the House committee on municipalities, it is understood that the bills were no longer acceptable to the Chicago transportation companies. Representatives of the surface and the elevated lines had not been at the capital since June 25 and in the closing hours of the session no one in the House or among those who backed the bills seemed concerned with their progress.

The program which will probably be followed in the new negotiations will first require that the city and companies come to a full agreement on the fundamental principles of a settlement. Following this, an ordinance will be drafted and submitted to the voters for a referendum with the explanation that if they approve it the enabling legislation will be obtained. The purpose behind the recently defeated company bills was first to obtain this legislation before negotiating an ordinance.

Further evidence of the desire of traction officials to co-operate with the city in working out a plan to take the place of the lost bills was revealed in a letter dispatched on July 1 to holders of the Chicago City & Connecting Railway collateral bonds by B. E. Sunny, chairman of the protective committee.

"The demand for a settlement," said Mr. Sunny, "'is so universal and urgent as to amount to a guarantee that a new program of procedure will be promptly arranged."

The letter also informed the security owners that pending settlement of the $39,458,000 principal of the first mortgage bonds of the Chicago City Railway and Calumet & South Chicago Railway, which has been in default since Feb. 1, dividends on the companies' stock will not be paid.

With only a little more than three weeks remaining before the six-month franchise extension granted last February to the Chicago Surface Lines, anxiety is again being expressed for the future of the lines. It is considered probable, however, that a new extension for six months will be granted on terms similar to the one now in effect with either the city or the companies having the right to terminate it upon 30 days notice.

New Ordinance to Be Drafted in Toledo

Terms of operating agreement, long under negotiation, are referred to committee of Council for drafting— Many changes made in Milner grant

SUBSTANTIAL concessions affecting the capital account of the Community Traction Company, Toledo, have been agreed to by the Henry L. Doherty & Company group in an effort to provide a basis for a new exclusive railway and bus franchise for Toledo.

The general plan of the present Milner service-at-cost ordinance will be followed, but numerous important changes which are aimed to provide better streets, improved service and which may lead to more reasonable fares are included in the recommendations.

$1,300,000 of New Money

The greatest concession made by owners of the property is the bringing in of $1,300,000 of new money against which no securities will be issued. Of this amount $1,050,000 will be required for carrying out the Riggs plan of rehabilitating, rerouting and building up the entire system of co-ordinated bus and railway service, $50,000 will be for added working capital and $200,000 will be placed to the credit of the stabilizing fund.

In addition to this new capital the Community Traction Company will be relieved of $400,000 of floating debt which was incurred when the management borrowed funds to pay interest on outstanding bonds and $240,000 of accumulated dividends on preferred stock. Dividends on preferred stock sold to small investors in the city will be paid regularly under the basis of settlement. These dividends have been paid in the past by Henry L. Doherty & Company, which has taken up receipts pending the resumption of dividends.

The deficit in the stabilizing fund is slightly more than $1,000,000. The effect of the new arrangement will be to relieve the fund of $640,000 of debt, provide $200,000 in cash and $50,000 of new working capital, or a total of $890,000. This, together with possible adjustments in the power contract, would start the new franchise off with a clean slate.

Under present conditions and the new basis of settlement the company would begin with $6,594,000 of 6 per cent bonds outstanding and $96,000 of 8 per cent preferred stock in the hands of the public. However, $140,000 more of bonds will be retired through sinking fund on July 31. This will further reduce the amount of earnings to be applied to capital charges. Under the change proposed in the ordinance interest on retired bonds would not have to be paid into the sinking fund. This has been a big drain on current revenues.

In return for all these concessions the company will be granted an exclusive franchise for ten years and with renewals possible in ten-year periods, together with a final fifteen-year amortization or city-purchase plan as provided under the Milner ordinance. The exclusive privilege shall apply only to the territory in the city adequately served by the company and all territory within ¼ mile of any transportation line shall be considered adequately served. Strengthening of the forfeiture clause to cover both bus and railway service is provided.

The Board of Street Railway Control will have added powers of right of inspection, with reasonable discretion to be used by it in approval of terms of contract respecting wage scales and major purchases of equipment, materials and supplies. These rights it must exercise so as not to interfere with the expeditious operation.

The company is also required to prepare and submit to the board an annual budget in which yearly earnings and expenditures are to be estimated.

The $1,300,000 to be provided by the management is not to be capitalized and it must not be amortized or ever considered a liability. However, the $400,000 from which the company is to be relieved is to be funded in the event that the franchise is renewed and extended, without interest and paid without interest at the rate of $16,000 a year. No such payment is to begin earlier than ten years from the date of the proposed new ordinance.

The basis of settlement has been referred to the rules, by-laws and ordi-

Digitized by Google

nance and railroads committees of City Council and the city authorities will now proceed with the work of drafting the ordinance. It is not considered possible that the measure will be ready to submit to voters for approval for several months.

The terms of the new settlement were negotiated by the Board of Street Railway Control, members of which have had close contact with the operation during more than six years.

Old and New Equipment in Independence Day Parade

The first electric car ever operated on Springfield, Mass., streets, the first bus and the latest type of carrier to be installed, the model car embodying many bus features, were all exhibited in a street parade in that city July 4. The occasion was to celebrate the 75th anniversary of the incorporation of Springfield as a city.

You May Be Victimized Next!

An impostor is at work in the electric railway field. Part of the time this man has been using the name of Walter A. Draper of Cincinnati, and so glib is the story he tells that he has succeeded in victimizing a number of people in the electric railway supply field. His story is a plausible one and the manner of the man carries conviction. In one of the cases in which he operated in New York, the impostor represented himself as a friend of a man formerly in the Chicago office of the company he was seeking to victimize. The story he told ran like this:

His wife, her sister and his boy were automobiling from Cincinnati to New York. He alone made the night run from Philadelphia to New York. His family took the train. He was held up between New Brunswick and Metuchen. There everything was taken from him—cardcase, letters, automobile, etc. As evidence that he had been held up he showed his empty pockets. He said he had gone to the police at New Brunswick and reported to them, but had trouble in getting money to come to New York. He threatened to see the Mayor of New Brunswick, as he purported to be well acquainted with the Mayor of Cincinnati. He professed to have made a mistake in not returning to Philadelphia and seeing a prominent official of the P.R.T. whose name he mentioned, or certain equipment people there. His family was due in New York at 5 o'clock. They were to stay at the McAlpin. The burden of his lament was that he would like to be helped out. His promise was that he would return the next day and reimburse the lender. He was profuse in his thanks and extended an invitation to the good samaritan to call on him in Cincinnati.

The man is described as being about 5 ft. 10½ in. high and weighing 170 lb. He is well built, has brown eyes, a rather round face with a complexion slightly red. One of those he victimized described him as wearing a brown suit, a brown hat and a light overcoat. On this occasion there was a gold ring around his tie.

$4,000,000 Job Completed by Long Island Railroad

Interchange of through freight traffic among the Long Island, the Pennsylvania and the New Haven Railroads, by means of electrically operated freight trains commenced on July 8, when electric locomotives replaced steam locomotives in the movement of freight cars from Bay Ridge, Brooklyn, to Port Morris, in the Bronx, via the Bay Ridge division of the Long Island Railroad, and the Hell Gate Bridge Route of the New York Connecting Railroad.

The complete electrification of the Bay Ridge division, between the float or transfer bridges at Bay Ridge and Fresh Pond, is now nearing completion, and within a few weeks the electric operation will be extended to include the entire freight service of the Long Island Railroad on the Bay Ridge division.

In April the Long Island started partial operation with electric locomotives between the New Lots classification yard, located west of East New York, on the Bay Ridge division, and Fresh Pond, and on June 29 a test train was operated between Bay Ridge and Port Morris, with an electric locomotive.

Now all through freight service between the waterfront at Bay Ridge and points on the New Haven Railroad as far east as New Haven, Conn., is operated by means of electric locomotives, eliminating entirely the use of steam motive power between the Long Island Railroad float bridges at Bay Ridge and the existing electrified system of the New Haven Railroad at Port Morris.

The Bay Ridge division of the Long Island Railroad and the Hell Gate Bridge Route of the New York Connecting Railroad serve as connecting links for the interchange of through freight traffic between the Pennsylvania and the New Haven Railroad systems.

Electrification of the Bay Ridge division covers more than 85 miles of main track.

Fourteen electric locomotives were purchased by the Long Island Railroad to carry on the electric freight train operations on the Bay Ridge division.

In conjunction with the electrification of the Bay Ridge division of the Long Island Railroad, the New York Connecting Railroad electrified its freight tracks between Fresh Pond and Port Morris, known as the Hell Gate Bridge Route. This is the first step taken by the Long Island Railroad to electrify its freight lines in Greater New York.

The estimated cost of electrifying the Bay Ridge division exceeds $4,000,000.

St. Paul Southern to Be Extended

An extension of the St. Paul Southern Railway from Hastings, Minn., to Zumbrota, 52 miles, is assured by Rice Associates, Minneapolis, which has acquired an option on all holdings of the company. The road now extends from St. Paul to Hastings. It has been operating under a receivership. This will give a new short route to Rochester, Minn., from the Twin Cities, with train service to inland points. To reach Minneapolis existing rail lines will be tapped at Inver Grove, just south of South St. Paul.

Westchester Road in Harrison

The New York, Westchester & Boston Railway's extension of its eastern division to a new terminal at Harrison, N. Y., was completed on July 2 and opened for regular service on July 3. With the opening, Harrison became the eastern division terminal, which since March, 1926, has been at Mamaroneck. For fourteen years prior to that time the terminal was at Larchmont. The joint station nearing completion at Harrison is of permanent fireproof construction and is one of the largest on the line, but it probably will not be a terminal for more than a year, as the Dwight P. Robinson organization, under contract, already is cutting through rock and erecting bridges for a further extension to Rye which will mark another step toward the projected establishment of a permanent terminal at Port Chester, at the Connecticut State line.

Chicago Surface Lines Wage Arbitrations Still in Deadlock

Efforts to break the long-existing deadlock in negotiations for a new wage scale for Chicago Surface Lines employees were renewed at a conference on July 6, but the session was adjourned without any real progress. The men's demands for a wage increase of 15 cents an hour over the present maximum rate of 75 cents an hour, together with $1,000 insurance policies and sick benefits of $20 a week, have been rejected.

Rumors current last week that the Surface Lines was considering a compromise adjustment of 5 cents an hour wage increase with sick benefits were denied by William Quinlan, president of the local union, at the close of the meeting on July 6.

Company officials have indicated a disposition to grant the men's demands for the free insurance and sick benefits, a concession which they estimate would amount to a 2 cents an hour increase, but they have made it clear that a wage increase is out of the question at the present time unless fares are increased.

Officials of the Chicago Rapid Transit Company and Chicago, Aurora & Elgin Railroad and representatives of the 5,000 trainmen of the former and 800 of the latter road who likewise met on July 6 to consider demands for a 15-cent increase in hourly wages, appear to have encountered the same difficulties as the Surface Lines wage conferees. The elevated men were granted free insurance and sick benefits a year ago last month and are now receiving a maximum rate of 77 cents an hour. It is believed that the elevated trainmen, who have also voted strike powers to their representatives, will support the Surface Lines employees in any action taken. Another meeting with elevated officials will be held July 12.

Coach at Grand Rapids Named After Col. Charles Lindbergh

Public ceremony attends dedication of car to flying colonel by Michigan railway. The historic vehicle now in active service

IMMEDIATELY after Col. Charles A. Lindbergh made his historic flight across the Atlantic Ocean L. J. DeLamarter, vice-president and general manager of the Grand Rapids Railway, Grand Rapids, Mich., conceived the idea of a timely dedication of a rail coach in honor of the colonel. This thought was conveyed to the officers of the Grand Rapids Flying Club, in the belief that in the spirit of aviation the club's efforts to gain greater public support of the local airport could be realized and also that the public ceremony which would attend such an event would not only be fitting but profitable. The club agreed. Accordingly a request was made by the Flying Club, through its president, Carl Batts, to Mr. DeLamarter to permit the club to sponsor such a coach at a public dedication. Immediately Mr. DeLamarter ordered a new rail coach built by the company's workmen in the company's shops and it was equipped, painted and completed in record time. Then came the public dedication of the coach on Sunday, June 19, in honor of the New York to Paris flier.

News stories and advertising informed the public of the event, held at the railway's amusement park loop at 5 p.m. This hour was chosen so as not to conflict with a public band concert in John Ball Park, at which, during the afternoon, the Elks band played for the first time in Grand Rapids the selection "Spirit of St. Louis," dedicated to Colonel Lindbergh. At 2 p.m., however, the Lindbergh rail coach was placed on public exhibition and inspection on the loop. More than 3,000 persons passed through it during the hours until the dedication, in spite of the counter attraction at the other park.

In the dedication speech, delivered by Mr. Batts, he sponsored the coach in behalf of the Grand Rapids Flying Club and thanked the railway for its cooperation in aiding both the local airport and the club by building the coach.

Lee H. Bierce, secretary of the Grand Rapids Association of Commerce, was introduced by Mr. Batts as the principal speaker. He made an inspiring talk on Colonel Lindbergh's achievements and praised and thanked the railway for its enterprise in being the first city to dedicate a railway coach to the flying colonel. He said that news of the coach dedication had been carried to all the leading newspapers of the country by the Associated Press, in addition to which the story was broadcast by the local radio station, WOOD.

During the dedication several thousand people crowded the loop as airplanes from the local airport swooped from the sky and flying low dropped floral tributes upon the attractive coach.

Telegrams telling them about the Grand Rapids coach dedication were sent by the local flying club to Colonel Lindbergh and his mother in St. Louis, Mo., where at that very hour the colonel was being welcomed home. An attractive album of photographs of the event, autographed by Mr. Batts, Mayor Swarthout, Mr. Bierce, Association of Commerce officials and Mr. DeLamarter, was sent to the colonel.

As a feature of the dedication one of the car operators, who will be known as "pilot" instead of chauffeur of the coach, was attired in the regulation one-piece flying uniform with goggles and helmet, in keeping with the atmosphere of the coach.

The new coach harmonizes with the quality of the railway's new equipment. It is made unusually attractive by the outside decorations, which include the name of Colonel Lindbergh and the flying insignia with American shield and gold star signifying a senior aviator. The coach panels are illuminated with artistic reproductions of the famous Lindbergh airplane, "Spirit of St. Louis." An unusual but very appropriate decoration is an 8-ft. airplane propeller that graces the full front of the coach. It is placed on a standard midway between bumper and illuminated dash. Small models of airplanes with revolving propellers are placed at the two front corners of the coach roof, and small American flags adorn the rear.

In the interior of the coach in the bulletin board rack is a crayon portrait of Colonel Lindbergh, with these words in gold letters: "This car named in honor of his world famous flight." Over the portrait in a bulkhead panel in gold letters is this inscription: "This car is sponsored and dedicated to Col. Charles A. Lindbergh by the Grand Rapids Flying Club."

The Lindbergh coach was placed in regular service the day after the public dedication. It is painted in desert sand color, with red and black trimmings, lettering being in gold. The seats are an innovation, being round-top reed, upholstered with leather, with air cushions.

Offer for Bridge Line Made by Philadelphia Rapid Transit

The Delaware River Bridge Joint Commission has received from the Philadelphia Rapid Transit Company an offer to pay to the Joint Commission a toll of ½ cent per passenger for the exclusive right to operate over the proposed trolley car line on the Delaware River Bridge. The offer was sent by President R. T. Senter of the P. R. T. to General Manager Joseph K. Costello of the Joint Commission.

In the first suggestion Mr. Senter said that if the Joint Commission should issue bonds to cover the costs of construction the railway would guarantee that in each year the total payments for toll should equal interest and sinking fund charges on the bonds. In the second, Mr. Senter said that if the railway were to finance the costs of construction the company would collect the tolls and pay to the Joint Commission the balance remaining after the deduction of 8 per cent per annum and 1 per cent per annum sinking fund, both cumulative, upon the actual costs of construction.

If the latter plan is accepted, Mr. Senter wrote, the company will agree that the Joint Commission shall have the right to take over the track, overhead and carhouse by paying to the railway its original expenditure, less accumulation in the sinking fund, "and substituting the arrangement as outlined above." In either event, Mr. Senter added, the improvements are to become part of the bridge and the property of the Joint Commission, "and the license or lease shall cover the full period until the costs of construction, whether represented by our expenditure or your bonds, are fully amortized through the sinking fund payments named."

The route of the proposed trolley line will be from the loop in the underground station at the Philadelphia bridge plaza, thence over the bridge to Fourth Street, Camden: thence to Mickle Street, to Fifth Street, to Linden Street, to Fourth Street and over the bridge to the Philadelphia station. The round trip length is 4.42 miles.

Suggests City Take Rockaway Lines

Purchase by the city of the Rockaway Beach and Far Rockaway divisions of the Long Island Railroad and the inclusion of these lines in the city's rapid transit system were suggested on June 28 by the Chamber of Commerce of the Rockaways in a letter to John H. Delaney, chairman of the Board of Transportation. The letter declared that the time was favorable for the purchase because the railroad was faced with an expense of millions in eliminating grade crossings on these divisions and set forth three offers to sell or lease the lines made by George Le Boutillier, vice-president Long Island Railroad, in recent talks with members of the chamber.

A letter from Mr. Le Boutillier was quoted to the effect that the Rockaway peninsula was the only part of the city not tapped by rapid transit facilities, although it had a permanent population of 70,000 and a summer population of 250,000, and that its transit service was unsatisfactory, inadequate and discriminating against the residents in the matter of fare. The letter added that the chamber did not ask any stipulation regarding the rate of fare to be charged if the city should take over the lines, and least of all would attempt any agitation that would jeopardize possibility of operation at a profit.

St. Louis Must Not Invade Commission Territory

The Missouri Supreme Court decided *en banc* on June 27 that the city of St. Louis was without the power to regulate to any extent, directly or indirectly, the rates of a public utility, or to prescribe regulations or practices which affect such rates. This decision was handed down in the test case by Victor Packman and Jesse Bishop, young St. Louis attorneys, who had been fined in the City Court for violation of a city ordinance which prohibits the selling or giving away of street car transfers. The court held this ordinance invalid on the grounds that it invades the province of the Missouri Public Service Commission, which has sole authority to regulate rates and charges and practices of public utilities, including street railways. The ruling reasserts previous decisions by the same court on public utility rate matters. The court, however, held that the city could require individuals in their dealings with the railway to observe the company rules and regulations affecting rates, because of the public interest involved in maintenance of just, reasonable and non-discriminatory rates, but this was the limit of the city's authority.

Service Resumed

After a lapse of two months, service on the Rockford-Belvidere Elgin line of the Rockford Traction System, Rockford, Ill., was resumed on July 2. During the suspension rehabilitation of the line, necessitated by the devastating storm which swept the district in April, was completed. Old lines and poles have been replaced by new ones, new ties laid and several sections of track replaced. The line was purchased from Bion J. Arnold by Milton J. Ellis, Rockford. Some of the eight new cars ordered for the Ellis lines will be placed in service on this property. Interurban schedules will be so arranged as not to conflict with the bus service maintained by the Ellis line along this route.

Contract for Operation Renewed in Minneapolis

The City Council of Minneapolis, Minn., has made a contract for another year with the Minneapolis Street Railway to operate the city's Columbia Heights filtration plant trolley line at a cost of $3,300. This line connects with the Columbia Heights car line of the railway.

Houston People Seek Election on Fare Ordinance

Petitions are being circulated requesting an election at an early date at which the people of Houston, Texas., can vote on the recent ordinance granting an increase in fares to the Houston Electric Company. Under the referendum provision of the Houston city charter the ordinance must be submitted to the voters if petitioned by a certain per cent of the qualified voters of the city. It seems assured that the required number of signers can be secured. Robert Brewer, secretary of the Houston Automobile Club, is in charge of the movement.

Free Service Increases Traffic

It is estimated that 50,000 persons in Springfield and vicinity availed themselves of the free service privilege granted between 9 and 12 o'clock in the morning of July 1 through an arrangement between the Chamber of Commerce and the Springfield Street Railway, Springfield, Mass. The purpose was to promote publicity for store windows exhibiting the products of Springfield industries and also to increase the store trade. Extra receipts on the regular fare basis offset the operating expenses incurred.

Omaha Company States Its Franchise Problem

Under date of June 17 the Omaha & Council Bluffs Street Railway, Omaha, Neb., addressed a letter to the Mayor and City Council directing their attention to the following conditions:

The bonded indebtedness of the company matures on Jan. 1, 1928, and we have been engaged for several months in negotiations for the refinancing of this indebtedness.

We find that it is impossible to obtain the funds to meet these maturing bonds until we receive franchise rights that are unquestioned.

From our negotiations up to this time we have been convinced that a franchise period of 30 years will meet the requirements of investors in this class of securities. This, however, we feel to be the minimum period which would meet their requirements.

We therefore ask that you call a special election for the purpose of submitting to the electors a franchise in ordinance form to be prepared in the manner provided by the statutes of the state.

It is highly desirable, we think, from the standpoint of the city and the car riders, as well as from the standpoint of the company, that the franchise be submitted as long in advance of the maturity of the bonds as careful and orderly procedure will permit.

We shall be pleased to meet with you for discussion and conference when and as you may desire.

It is understood that upon the new franchise becoming effectual we will waive all claims to a perpetual franchise.

This communication was read in the Council meeting on June 21 and referred by that body to the Corporation Counsel with instructions to prepare an ordinance and report it back to the Council at a future meeting.

The hope is publicly expressed by the company that a franchise which will fully protect the rights of the public and at the same time deal fairly with the company may be agreed upon at an early date, in order that the latter may be enabled to serve the community in the best possible manner.

Legal Preliminaries in Boston Explosion Case

Litigations involving the Boston Elevated Railway, Boston, Mass., growing out of a film explosion in the subway on Jan. 3, 1925, are about to start. The case is to be tried before a jury and Judge Williams in the Suffolk Superior Court. The jury has been chosen and the case temporarily suspended. Eighty-eight law suits, with a total damage claim of more than $1,000,000, have been entered as a result of that explosion. The defendants are the Boston Elevated, the Famous Players-Lasky Corporation and John F. Bowditch. At the outset only three cases, brought by one plaintiff, Madeline F. Guinan, are to be tried, on the question of liability. They are test cases.

Films carried by a passenger on a street car exploded in the subway and hurt several passengers. At the time of the accident it was contended that the elevated had no knowledge of the presence of the films in the car and that the transportation was not in conformance with the rules and regulations.

No Decision in Jersey Case

Pending a decision by the Board of Public Utility Commissioners of New Jersey, it is understood the Public Service Railway will not avail itself of its right under the law to put into effect its fare zone adjustment on eleven bus lines and one railway line.

The proposed adjustment of fares was to have been effective as of Jan. 1, but the commission has twice suspended it for three-month periods, which it is authorized to do under the law.

The adjustment in fare zones, it was estimated by Public Service witnesses during the hearings, will bring in additional gross revenue of $600,000 annually. The municipalities affected are Irvington, Bloomfield, Elizabeth, Roselle, Kenilworth, Hawthorne, Clifton, Passaic and Rutherford, as well as Newark. In most instances, the effect of the readjustment in fare zones, if approved, will be to increase fares.

Johnson City Agrees to Fare Increase

The Board of Trustees of Johnson City has approved a written stipulation with the Binghamton Railway, Binghamton, N. Y., agreeing to withdraw the village's objections to the railway's petition for a fare increase providing the company sells four tickets for 30 cents. This provision already had been accepted by the railway. The trustees directed their attorney to withdraw the objections before the Public Service Commission and send that body a certified copy of the stipulation. The fare agreed upon permits a charge of 10 cents for a single ride with four tickets for 30 cents. By purchasing tickets, the fare will be increased one-half cent as the rate now is 7 cents.

Recent Bus Developments

Shore Line Officials Take Over Carey & Leach Bus Lines

At a meeting of the stockholders of the Carey & Leach Bus Lines, Inc., held in Kalamazoo, Mich., recently, the name of the company was changed to Southwestern Michigan Motor Coach Company. Operation of the company is now under the direction of J. C. Johnson, general manager of the Shore Line Motor Coach Company, who became general manager of the Carey & Leach line several weeks ago. A. B. Carey, who resigned as president and general manager, continues as a member of the board of directors and will serve the company in an advisory capacity. Walter C. Loy of Michigan City, Ind., has been appointed assistant general manager. The Southwestern Michigan Motor Coach Company will continue to operate the same service formerly rendered by Carey and Leach between Chicago and Detroit and between Kalamazoo and Benton Harbor, South Bend and Sturgis.

The Shore Line Motor Coach Company is owned jointly by the Gary Railways and by the Chicago, South Shore & South Bend Railroad.

Jersey Coast Bus Fares Discussed

Commissioners of Long Branch, Allenhurst and Deal, N. J., are objecting to the three 10-cent fare zones which the Coast Cities Railway demanded as the basis of the proposed substitution of buses for the present railway line between Long Branch and Asbury Park. The commissioners favored five 5-cent zones instead. The matter was deferred until a future meeting, when the 5-cent zone proposal is expected to be passed. The railway operates buses south of Asbury Park as far as Manasquan, through Belmar, Avon and a number of other Atlantic Coast resorts, and north of Asbury Park to Long Branch.

Terminal Project Proposed in Providence

Eugene J. Phillips, vice-president of the New York, New Haven & Hartford Railroad, has proposed to the Council of Providence, R. I., a plan for the construction of a bus terminal on Railroad Street, behind the Union station, by the New England Transportation Company, a subsidiary of the railroad, and for the use of this terminal only by the buses of the New England, United Electric Railways, Interstate Limited Motor Coach Company, Newport Electric Corporation, Interstate Buses Corporation and "quite likely" another line operating between Boston and Providence. A clause in the plan provides that companies in the combination be protected against competition in the center of the city by the creation of an area in which all highway motor stops, excepting those of the United Electric Railways, which operates both local railway and bus lines, shall be forbidden. The restricted area is roughly bounded on the east by Benefit Street, on the south by Crawford Street, on the west by Empire Street and on the north by the New Haven Railroad property.

Co-ordination Essential

Minnesota state body passes upon fares and comments on the need for unification

The Minnesota Railroad and Warehouse Commission has ordered a charge of 12 cents for local fares on the Selby-Lake interurban bus line in St. Paul. Minneapolis was not represented and the order does include local fares in that city. Passengers must use tokens to get this half rate. The through interurban rate continues at 25 cents and in Minneapolis the local rate will continue to be the same as the through rate, or 25 cents. The company is equipping itself with tokens and special fare boxes.

A petition of the city of St. Paul for half fares for local travel on the other two interurban bus lines of the Twin City Motor Bus Company, subsidiary of the Twin City Rapid Transit Company, has been denied on the ground that where bus lines parallel railway lines a higher charge should continue. The Selby-Lake line therefore will be rerouted via Smith Park to Minneapolis. The order is to be effective in the near future.

Twin City Rapid Transit Company officials and the bus committee of the St. Paul City Council reached an agreement for this reduction in local bus rates at a conference on May 13. This followed the suggestion by the commission at a hearing earlier in May on a petition by the city for reduced local bus fares on all lines of interurban travel. Commissioner Ivan Bowen said he did not believe buses along car lines should be placed in competition with trolley cars and recommended that the Council and the railway agree on a plan for rerouting bus lines to avoid this competition. This may be considered further in relation to the Como interurban bus line, which could compete with the Como-Harriet interurban railway.

In reporting on a study of electric railway and bus transportation in Philadelphia, Washington, Indianapolis and other cities the statement read in part:

In all of these cities efforts have been made and are now being put forth to coordinate local transportation systems under one operating company. This commission is convinced that the proper co-ordination of bus and railway transportation is essential to protect the interests of the street car riding public who are particularly concerned with the low cost of transportation.

Duplication of Service Protested by Oklahoma Railway

The Oklahoma Corporation Commission on June 20 heard an application of the Yellow Cab Transit Company for a permit to extend its Oklahoma City-Sapulpa bus service to Tulsa, with the understanding that it should not carry local passengers between Sapulpa and Tulsa.

The Yellow Cab Transit Company operates small passenger cars from Oklahoma City to Bristow and buses from Bristow to Sapulpa, transferring to the interurban line of the Oklahoma Union Railway at the latter point passengers who desire to go on to Tulsa. The applicant says that there is a demand on the part of the traveling public for through passenger service between Oklahoma City and Tulsa and that many of its passengers object to the necessity of transferring at Sapulpa.

J. A. Frates, vice-president of the Oklahoma Union Railway and president of the Union Transportation Company; R. V. Miller, general manager of those companies, and others opposed granting the permit. Mr. Frates stated that there was absolutely no necessity, in his opinion, for additional service between Sapulpa and Tulsa, and that the proposed through service would not be practical until the roads are paved the entire way between Tulsa and Oklahoma City. He expressed the opinion that the immense investment of his company in rails, cars and bus equipment should be protected against direct competition so long as his company stands ready and is able to furnish any additional service needed. He stated that his company has furnished the Yellow Cab Transit Company terminal facilities in its Sapulpa depot, answered all telephone calls and handled other business of the motor transportation company. Mr. Miller supported Mr. Frates' testimony with figures showing that daily passenger transportation service between Tulsa and Sapulpa now constitutes nineteen interurban trains, two through buses, six other buses and nine Frisco trains, a total of 36 trains or buses each way daily. He expressed the belief that this was sufficient transportation facilities to meet present requirements and that additional competing service would immediately result in loss of business to his company and would probably ultimately result in curtailment of service or discontinuance entirely of interurban service between Tulsa and Sapulpa.

The hearing was continued to a later date to be set by agreement of counsel when testimony will be taken at Tulsa.

Employees Selling Chartered Bus Service in Baltimore

Since it was announced that a commission would be paid to employees of the United Railways & Electric Company, Baltimore, Md., who aid in the leasing of chartered buses and de luxe motor coaches many employees have

Digitized by Google

earned these commissions. As far as convenience is concerned, the Baltimore company arranges to take members of a tour party from any gathering place they may select and to the very gateway or door of the point they wish to visit. Not only that, but the coach will pick up each member of a party at his or her door, and at the end of the trip deliver them home in the same manner. This applies, of course, to chartered coaches or buses, and not to the company's scheduled tours, for which individual seats are sold.

In the matter of equipment for this service, the railway has two major types of vehicles — one it designates as "buses," and the other as "coaches." The difference is in the construction and the character of furnishings of the vehicles.

Of their respective types the vehicles of the company are the best procurable. They are ample in size, provided with roomy seats, and in every way built and maintained to afford comfort. These points are stressed by the company to stimulate the employees to still greater efforts in selling this service.

Coast Coach Service Out of Los Angeles

De luxe motor coach service between Pershing square, Los Angeles, and Castellammare, on the coast above Santa Monica, has been started by the Pacific Electric Railway. The new line is known as the Beverly Boulevard Motor Coach line. It operates over the new scenic Beverly Boulevard via Beverly Hills, Holmby Hills, Bel-Air, U.C.L.A. site, Brentwood Park and Pacific Palisades. Service is hourly in both directions, leaving Los Angeles at 6:30 a.m. and 11:30 p.m. on Hill between Fifth and Sixth Streets, and leaving Castellammare at 6 a.m. and 10 p.m.

When Is a "Restricted" Area Restricted?

A new interpretation is sought by bus interests in Massachusetts of the law under which the State Department of Public Utilities issues licenses or certificates of public convenience and necessity for certain bus lines. A test case is being made of the complaint against Alphonso Roberto, who operates a bus through Revere. He is charged with taking on and discharging passengers in a restricted area—an area in which, under his license, he was not permitted to do a local business. The defence, as outlined by Herbert Parker, his counsel, is that a passenger cannot be held a prisoner in a bus, but must be permitted to get out when he desires, even if it is in a restricted area. Mr. Parker takes the position that the Public Utilities Commission cannot even grant express or non-stop permits between two points. "I do not believe," he says, "that you can grant express rights through a territory and prohibit the holder of those rights doing a local business."

Financial *and* Corporate

Railroad After Interurban

Western Pacific Railroad would purchase stock of 100-mile California road

Bondholders of the San Francisco-Sacramento Railway will be asked to take concerted action to obtain the remaining common and outstanding preferred stock of their company unless the shareholders accept the offer of $5 a share on the common and $20 a share for the preferred by Western Pacific Railroad interests. Action by the bondholders is expected to mean foreclosure after Aug. 1 if the offer for the purchase of the stocks to straighten the line's tangled finances is unsuccessful.

Some time ago interests identified with the Western Pacific Railroad agreed to advance funds to pay bond interest and to redeem the payment of bonds of the San Francisco-Sacramento Railroad, Oakland, Cal., operating about 100 miles of electric railway. At the same time they offered $5 a share for the common stock of the railway.

For some time past the condition of the San Francisco-Sacramento Railroad has been critical. Its income has not been sufficient to meet bond interest and redemption payments upon its bonds, not to mention necessary capital expenditures. On Jan. 1, 1927, there came due $23,640 of bond interest, with $42,000 additional needed for bond redemption. The company did not have funds sufficient to meet these demands and a committee pointed out that unless they were met the bondholders would foreclose with a resultant wiping out of both preferred and common stock issues.

To the end that foreclosure might be averted the officers of the company succeeded in interesting the Western Pacific Railroad owners in the future possibilities of the road. These interests then agreed to advance $75,000, a sum sufficient among other things to meet the January bond interest and redemption. These advances, together with past advances, are now secured by a second mortgage on the road. Coupled with this loan the officers of the interurban also succeeded in procuring an offer of $5 a share for 40,000 shares of the outstanding common stock provided, of course, that the holders of at least 40,000 shares of the common stock avail themselves of the offer. The committee that acted in connection with this deal are members of the board of directors of the San Francisco-Sacramento Railroad. It recommended the acceptance of the $5 offer for the shares because considering the financial condition of the road the members of the committee regarded the offer as liberal and because the Western Pacific interests in making any offer at all did so in order to secure operating control of the road so as to effect economies by joint operation and protect their loans.

It was explained that if the Western Pacific interests could not secure the stock through ownership they would undoubtedly have to resort to collection of their loan through foreclosure, a position particularly unpleasant. It was suggested to the stockholders that in order to avail themselves of the offer, they deposit their stock with the Wells Fargo Bank & Union Trust Company, San Francisco.

This proposal lapsed, and was succeeded by the purchase of 40,000 shares of common by Arthur Curtis James. Then an additional offer was made to save the road from foreclosure, and unless this offer succeeds shareholders seem likely to be wiped out.

Traffic Fare and Wage Figures

The decrease in the number of passengers carried by electric railways noted in the month of April compared with April of 1926 was continued in May. The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 202 companies for the latter month, compared with the similar month of 1926, is as follows:

May, 1927	789,050,061
May, 1926	806,061,648
Decrease, per cent	1.00

Average cash fare in cities of 25,000 population and over:

	Cents
June 1, 1927	7.8488
May 1, 1927	7.8304
June 1, 1926	7.6946

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate, Cents	Index Number 1913 = 100 Per Cent
June 1, 1927	57.12	209.61
May 1, 1927	57.10	209.54
June 1, 1926	56.82	208.51

Legal Railway Bonds Certified in Massachusetts

The Department of Public Utilities of Massachusetts has transmitted to the Bank Commissioner its annual list of Massachusetts public utility securities that have met the requirements of law relative to legal investments for savings banks. A long list of gas, electric and water companies have earned at least 4 per cent on their capitalization for the past three years, with gross income in 1926 of at least $100,000, making their bonds legal investments for Massachusetts savings banks. In addition, the bonds of the following electric railways are legal investments through the companies having earned and properly paid, without impairment of assets or capital stock, dividends equal to 5 per cent on all outstanding stock in each of the five preceding years: Boston Ele-

Digitized by Google

vated, Boston & Revere Electric Street Railway, Holyoke Street Railway, Union Street Railway, New Bedford, and Eastern Massachusetts Street Railway series "A" bonds—the latter being those issued in exchange for the old Bay State Street Railway bonds under terms of the special act.

Gain in Traffic in Cincinnati

During May 11,447,372 passengers were transported by the Cincinnati Street Railway, Cincinnati, Ohio, an appreciable increase over May of last year, it is set forth in a report submitted to Edgar Dow Gilman, Director of Public Utilities. Walter A. Draper, president of the company, pointed out that the $1,505 surplus, as in previous months, was less than it would otherwise have been by reason of the use of available funds for paying as large a part as possible of the cost of track replacements.

The increase in the number of revenue passengers on cars alone over the corresponding month of last year was approximately 500,000. Mr. Draper said this indicated the tendency on the part of the public to use the improved facility offered by the street car.

Decrease in Baltimore Traffic

The number of revenue passengers carried on the lines of the United Railways & Electric Company, Baltimore, Md., in May decreased 777,440, compared with the similar month in the year previous, totaling 19,001,550 against 19,779,990. In the first five months of 1927, 1,761,984 fewer revenue passengers were transported than in a similar period a year before, the figure being 93,381,855, against 95,143,839 in 1926. For the five months period the net income was $305,758, against $386,569 for the firve months period ended May, 1926.

Line in Batavia to Suspend

Stephen W. Brown, president of the Batavia Traction Company, Batavia, N. Y., said on June 12 that although the company had made every effort to keep up the service it was useless to continue, as the receipts would not warrant any further effort on the part of the officers of the company.

About two months ago the company asked the Common Council to permit operation of buses under sanction from the Public Service Commission, but the officers were not in a position to promise the Councilmen that they would furnish such a service. As yet the Common Council has taken no action on the request.

The line in Batavia is part of the project begun about 25 years ago to build an electric railway from Buffalo through Williamsville to Rochester, of which the line in Batavia was to have been a link, but the proposition never went through. There are only 2½ miles of line in Batavia.

Surplus of Midland Utilities Up $250,068 for Year

Total income of the Midland Utilities Company, Chicago, in 1926 was $4,096,498, compared with $2,985,781 in 1925. Surplus earnings were $1,385,908 after payment of dividends on the prior lien and preferred stocks, interest on loans and funded debt, contingency reserve appropriations, administration expenses and miscellaneous charges. This figure shows a gain of $250,068 over surplus earnings in 1925. Total surplus account of the Midland Utilities Company on Dec. 31, 1926, was $1,951,579.

Operating revenue and other income of the Midland Utilities Company and subsidiaries for 1926 was $20,191,060. Net income for the year, after deductions for rentals, interest on funded debt and other charges and expenses and contingency reserve appropriations, was $4,127,867, which after dividends and earnings accruing to outside subsidiary stockholders to the amount of $845,669 were deducted left $3,282,198 available for Midland Utilities Company dividends.

Gross earnings of the subsidiary companies for the year from electric utility were $7,179,244, from gas utility $7,400,673 and from railway utility $4,928,937.

The consolidated balance sheet of the Midland Utilities Company and subsidiary companies as of Dec. 31, 1926, showed total assets of $113,854,494. Assets of the Midland Utilities Company alone, as of the same date, were $43,558,022, an increase of $11,102,844 over the preceding year.

Passenger traffic in 1926 on the Gary Railways, Gary, Ind., increased 14.4 per cent over the volume handled in the preceding year. The total number of passengers was 17,843,470, compared with 15,597,784 in 1925. During the month of December, always the heaviest month, 1,588,276 passengers were carried, the largest number handled in any month in the history of the company.

Approximately $410,000 was expended by the company during 1926 for the betterment of its present facilities and for extensions required by the transit needs of the district that is served.

The total mileage of the local and interurban railway system of the Indiana Service Corporation, Fort Wayne, Ind., amounted to 282.4 miles at the close of 1926. Car mileage figures for 1926 show an increase of more than 300,000 over the total for the year preceding. Total car-miles for 1926 were 6,766,522. The total number of passengers carried on all lines in 1926 was 25,677,845, compared with 18,403,811 in 1921, or an increase of 39.4 per cent in six years.

INCOME ACCOUNT OF MIDLAND UTILITIE COMPANY

	Year Ended Dec. 31 1926	1925
Total income	$4,096,498	$2,985,781
Total expenses including administration and other charges	508,000	333,779
Interest on loans and serial gold notes	310,368	214,089
Income for year	$3,278,130	$2,437,912
Appropriated as reserves for contingencies	150,000	150,000
Net income for the year	$3,128,130	$2,287,912
Dividends declared	2,391,905	1,747,997
Proportion of subsidiary companies' aggregate undistributed surplus for the year accruing to Midland Utilities Company	155,090	376,877
Combined surplus earnings of the Midland Utilities Company and subsidiaries	1,385,908	1,135,840
SURPLUS ACCOUNT		
Surplus Jan. 1	$1,115,607	$638,228
Net income for the year	3,128,130	2,287,912
Dividends paid	2,391,905	1,747,997
Surplus Dec. 31	$1,951,579	$1,115,670

Receipts and Traffic Increase in Winnipeg

As a result of the continuance of good business conditions in Winnipeg, Canada, in 1926 the railway utility of the Winnipeg Electric Company registered further improvement. This fact was disclosed in the annual report of the president and directors.

The railway carried 57,985,000 revenue passengers, compared with 55,096,000 in 1925. Its gross receipts increased $179,000. Operating or working expenses of the railway end of the business showed an increase of $97,000

INCOME ACCOUNT OF THE SUBSIDIARY COMPANIES OF THE MIDLAND UTILITIES COMPANY FOR YEAR ENDED DEC. 31, 1926

	Indiana Service Corporation	Chicago, South Shore & South Bend Railroad	Gary Railways
Operating revenue	$4,345,946	$1,056,858	$1,349,331

Digitized by Google

over the preceding year. This increase was due to several factors, among which are the operation of a greater number of street cars and buses to take care of the increased traffic and extensions to service required by the city of Winnipeg and municipalities served, a wage increase for trainmen, which was made effective May 1, and increased expense for fuel to heat street cars and removal of snow from tracks on account of the severe climatic conditions experienced in November and December.

The company did considerable extension work during the year, including the construction of a new double track on Osborne Street and Memorial Boulevard, construction of a single track extension on St. Anne's Road to the extent of 8,200 lineal feet, laying a second track of 1,100 lineal feet in East Kildonan, alterations and equipping with treadles 60 of the street cars to make them adaptable for one-man, two-man operation. Four new buses were purchased.

The retiring of the outstanding balance of 5 per cent first mortgage bonds of the Winnipeg Street Railway which matured Jan. 1, 1927, amounting to $468,000, was largely taken care of by selling an equal amount at par value of first refunding 30-year 5 per cent sinking fund gold bonds, due Jan. 1, 1935.

In line with its policy of enlisting as many local shareholders as possible, the company conducted its second customer-ownership campaign on Dec. 13, 1926. Only 2,500 shares of the company's 7 per cent cumulative preference stock were offered and the campaign was advertised to run for ten days, but so great was the demand that the sale closed within 48 hours, with 11,377 shares applied for by 2,222 customers and cash receipts of more than $635,000.

At a meeting of the shareholders held on Jan. 20, 1927, an increase in the 7 per cent preference shares from $3,000,000 to $10,000,000 was authorized. The stock is not to be offered for sale at one time, but is to be held in the treasury and sold from time to time as the company requires funds for extensions and improvements. The call price of the existing $3,000,000 of preference stock, as well as the additional $7,000,000 authorized, was increased to 105 and accrued dividend.

One-Car Road Would Suspend

George Tunnell, manager of the Milledgeville Railway, Milledgeville, Ga., recently filed with the Georgia Public Service Commission a petition asking for authority to discontinue the passenger car between the Georgia depot and the State Sanitarium. The car has been in operation since the charter was granted permitting the railroad to run its tracks through the city. At the hearing before the commission Representative McCluney argued that the franchise provided for both passenger and freight service, and the company should be required to stop both if it stopped either. Judge E. R. Hines, G. E. Barnes, C. E. Yeomans, an engineer, and Mr. Tunnell appeared in behalf of the petition to stop passenger service, undertaking to show that it was unprofitable, because of bus and other competition.

Line to Mount Clemens Dropped by Detroit United

Direct service between Detroit and Mount Clemens on the Lake Shore line of the Detroit United Railway, Detroit, Mich., ceased at midnight on June 22 with the expiration of its 30-year franchise. According to W. S. Rodger, general traffic agent of the line, the service will be discontinued only in Grosse Pointe Shores and Harrison Township. The line will continue to operate from Alter Road at the city limits to Gaukler Point, near Defer Road. The discontinuance of the schedule through Harrison and Grosse Pointe is being made at the requests of the residents in those sections.

According to the Mount Clemens dispatches a request by the railway for a day-to-day permit to operate would be refused by Harrison Township, where objections to the line and service have been prevalent for some time. Negotiations are under way now in Mount Clemens and St. Clair Shores to start a bus service in both places and connect the two. The change by the railway will not affect passengers going directly from Detroit to Mount Clemens, as the company has a direct line on Gratiot Avenue. In fact, the shore line has not offered this service in the last two years, as the cars have only come to the city limits.

Railway Service in Maine Curtailed

Further curtailment in service by the York Utilities Company between Sanford and Biddeford, Me., via West Kennebunk, Kennebunk and Kennebunkport, became effective on July 1. The new schedule cuts down the number of trips to Sanford to four, while cars to Biddeford, from West Kennebunk, will run on a two-hour schedule. About fifteen men, including motormen, conductors and mechanics employed in the carhouse, will be affected by the curtailment. This reduction in service has come about through lack of patronage.

While during the year 1925 and 1926 the revenue from railway service between Sanford and Biddeford remained about the same, during the first six months of this year there has been a decrease of about 20 per cent, and this in spite of the fact that the company has run cars frequently and at convenient periods. A few years ago the company was forced to abandon its line to Wells, and on April 30 of this year the line to Cape Porpoise, at one time a well-patronized section of the road, was discontinued. Last year the company made the Kennebunkport branch a freight line, providing buses for passenger service to that town and Cape Porpoise.

Earnings Record of Third Avenue Railway Continues Good

The report of the Third Avenue Railway, New York, for the eleven months ended May, 1927, shows record high operating income of $14,017,662, an increase of $627,421 over the corresponding period of last year. After all deductions, including liberal allowances for maintenance of way and equipment and allowance for full interest on the adjustment 5 per cent bonds, there was a surplus of $263,186, an increase of $233,827 over last year. With the company in a strong current position and income steadily increasing, the *Wall Street Journal* anticipates payment of the regular 2½ per cent interest on the adjustment 5 per cent bonds, due on Oct. 1.

Santa Monica Line to Go

The Pacific Electric Railway, Los Angeles, Cal., has been authorized by the Railroad Commission to discontinue service and remove its track on Broadway and Third Street in the city of Santa Monica on the following routes: A single-track railway commencing at the switch points of the turnout in the northerly track on Ocean Avenue, easterly of Broadway, thence northerly across Ocean Avenue to Broadway, thence northeasterly along Broadway to Third Street, thence northwesterly along Third Street to the switch points of the turnout in said Third Street west of Santa Monica Boulevard, also the curve at the south corner of Santa Monica Boulevard and Third Street, connecting the tracks on Santa Monica Boulevard with track on Third Street.

MISSOURI COMPANIES MERGE.—The Springfield Gas & Electric and the Springfield Traction Company, Springfield, Mo., both under the same ownership, have been merged as the Springfield Electric Company.

NET INCOME LOWER.—For the eleven months period ended May 31, 1927, passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $10,503,453, against $10,430,556 for a similar period of the year previous. Operating expenses and taxes were $9,166,999, against $8,892,381 for the 1926 period. After the consideration of income deductions a net corporate income remained of $1,041,750, against $1,321,424 for the period ended May 31, 1926.

ABANDONMENT PETITION HEARD.—Decision on the proposed abandonment of part of the service of the Geneva, Seneca Falls & Auburn Railroad, Seneca Falls, N. Y., is under consideration by the Public Service Commission following a hearing conducted at Seneca Falls on June 20 by the Public Service Commission. The railway is in the hands of a receiver and foreclosure proceedings are pending. The Seneca Falls branch from Fall and Cayuga Streets east is operated at a loss and the company seeks to cut it off.

Book Reviews

Public Utility Finance

By Walter E. Lagerquist. Chicago and New York: A. W. Shaw Company. 671 pages. Price, $7.50.

Another important accession has been made in this volume to the growing list of titles on utility subjects. In fact, Mr. Lagerquist's book is the first of several volumes to be sponsored by the Institute for Research in Land Economics and Public Utilities to be entitled "Materials for the Study of Public Utilities," which contemplates a closely co-ordinated series in which each volume will be devoted to a particular subject, yet represent only a part of a unified whole. These volumes will include works on public utility economics, regulation, labor, accounting, operation and management, and rate making.

"Public Utility Finance" really grew out of the need the author met in searching for material in connection with a special purpose in the field of public utility finance. This search covered the technical periodicals on utilities, the proceedings of all the technical societies, and financial periodicals of the past fifteen years which might have any bearing on the field, together with innumerable pamphlets, all of the important financial books, and a considerable number of technical publications. Of such superior character was the material thus unearthed that it seemed desirable to offer the results for publication.

Many short paragraphs on finance dealing with rates, regulation, etc., could not be used, as no practical sequence could be developed out of the material. Only such complete articles or excerpts were selected on respective topics as would fit into the scheme of the author's outline. The author frankly says that differences of opinion will arise among those familiar with the fields of literature mentioned as to the selections made, but this is a responsibility the collector of materials assumes. In certain controversial matters an effort has been made to include each side of the controversy.

It is, indeed, difficult properly to appraise a book like "Public Utility Finance," but whatever the defects inherent in a compilation of this kind from the point of view of coherence, there can be no question about the wealth of material contained between its covers or its value and availability to every one seriously concerned with public utility management. The very diversity of the subjects is at one and the same time both distressing and pleasing. This is made true by the dissimilarity of the styles of the authors of the articles. The book cannot be taken at a gulp. Such books are never so intended, but the volume is not without its leaven of sweetness, best instanced, perhaps, by the recollection of F. B. H. Paine's quotation of a sentence from a rate case as presented by *Life* to this effect:

To determine a fair price for any commodity or service take one dozen investigators at a large salary, 57 lawyers, eighteen statisticians, and any desired number of detectives, experts, stenographers, and so forth. Mix in a large hall. Add the testimony of a couple of dozen buyers as to the amount they want to pay for the commodity or service. Sprinkle in 400 absurd and insulting questions to sellers of the same. Stir briskly; boil six weeks, allow to simmer 14 months, and divide the product by 2. The result may not have any sense in it, but it will have as much as by any other way of getting at the matter, and it will please more voters than it will immediately ruin.

Or, as the *Wall Street Journal* more recently said about a contemporary who took itself very seriously, that it did not know any better than Joe Eastman or Will Rogers what the invested capital of the railroads is.

Of course valuation is only a part of the problem, but, as Mr. Paine says, it is for all of us, now, to eliminate the travesty which amounts always to a tragedy; to do so the closest analysis is essential of what constitutes a "valuation." "Public Utility Finance" is a source book, and a very valuable one.

Experimental Electrical Engineering

Third edition, revised. By Vladimir Karapetoff. New York: John Wiley & Sons, Inc. 620 pages. Price, $5.

More than 100 teachers of electrical engineering and many of the leading engineers in industry have helped in the preparation of Vol. II, new revised third edition of Professor Karapetoff's book. The book represents the culmination of more than 25 years of studies in electrical literature in various languages; theoretical research, experimental work, practical work in industrial concerns, designing and teaching. Besides a table of contents, the text has a list of experiments, with an extensive index to all subjects mentioned and to the keywords as well.

Universal Directory of Railway Officials

Westminster, London, S.W. 1: The Directory Publishing Company, Ltd. Price, $5.

The 33d annual edition, 1927, of the Universal Directory of Railway Officials has been compiled. There are sections on Great Britain, Ireland, Europe, Asia, Africa, Australasia, North America, Central America, Mexico, West Indies, South America. It also includes the personal index of railway officials. Many engineering firms doing business with railways at home and abroad use this book.

Captains in Conflict

By Robert R. Updegraff. Chicago & New York: A. W. Shaw Company. 286 pages. Price $2.

If American big business were ever afflicted with a fit of self-complacency or smugness a few doses of "Captains in Conflict" would prove an efficacious cure. For a reading of this book would awaken the business generation of today to a realization of its noble heritage which has been the main subsidy in the present day spectacular ventures.

For 25 years business pioneers sailed uncharted waters. Many a gale had to be weathered, many a rough wave buffeted and countless ventures foundered before serenity replaced anxiety. But that business generation which set sail in 1900 had the attributes of the pioneer—courageous, long suffering and resourceful. Disguised as a novel, this recital of a business struggle is both entertaining and enlightening. John Rowntree struggles to play the business game fairly. His competitor, H. B. Lockhart, a former employee of Rowntree's father and an absconder of the latter's stove patent, is a hardened, unscrupulous money-hound who overcapitalizes his corporation and cares not a tinker's dam for widows and orphans. The indomitable courage of young Rowntree, a noble scion of a still nobler father, continues over a period of 25 years. Through many anxieties, unfortunate breaks and heart-breaking defeats he comes up smiling on a platform of honesty, service and progress. When the hour struck for him to make a spectacular condemnation of his opponent, the epitome of sordidness and chicanery, he passes up the chance and unostentatiously puts the screws on the business wrecker.

But "Captains in Conflict" does much more than tell the story of the Rowntree stoves versus the Consolidated ranges. Herein is enfolded an epoch in the business drama, human and stirring. The era of great business combinations and industrial consolidations had dawned; the quintessence of selling was in the product and not in the personality of the salesman. Business promoters typified by Rowntree talked of simplification, of a human attitude in building up business and of the trend toward capital "fast coming to represent savings of the working millions."

Business leaders today will find inspiration in Mr. Updegraff's portrayal of business in the making. They will profit by this tale of rivalries and legerdemain to the end that they too may become Rowntrees in an effort to keep business on the ascendent scale it reached at the turn of the century. It should teach the leaders of today that severance with the past is neither possible nor desirable, for who would gainsay that the future stability of business is not dependent upon the wise moves of today as the courageous undertakings of a quarter of a century ago made clearer sailing for the present day promoters. "Without the learning of the past, there can be no future" should be an important part of big business philosophy.

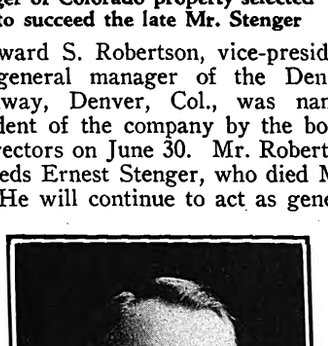
Personal Items

H. S. Robertson Denver President

Former vice-president and general manager of Colorado property selected to succeed the late Mr. Stenger

Howard S. Robertson, vice-president and general manager of the Denver Tramway, Denver, Col., was named president of the company by the board of directors on June 30. Mr. Robertson succeeds Ernest Stenger, who died May 28. He will continue to act as general manager in his capacity as president. Mr. Robertson made this brief public statement:



H. S. Robertson

There will be no change in policies. I shall try, as Mr. Stenger did, to give the people of Denver a first-class street car service.

Mr. Robertson knows Denver, and he certainly knows the Denver Tramway. He has been connected with the property for 26 years. Just about two years ago he was made general manager, following the resignation of Edward A. West as general superintendent to join the Utah Light & Traction Company, Salt Lake City. Of course, his initiation into that office was a little more formal than the newspaper account of it at the time made his promotion appear, but in sum and substance it ran like this: "Mr. Robertson, you are thoroughly familiar with the policies of the company, and as our general manager you will please direct us." That's how the vacancy was filled. His advancement to the presidency was largely a repetition of this procedure, with its implied vote of confidence in the man.

For about twelve years previous to his appointment as general manager, Mr. Robertson had been secretary of the company and a member of the board of directors. While he did not take an active part in the operating details, he knew what was going on. Because of this and his untiring devotion to duty, his advancement to the general managership followed. Exercise of the same attributes has won for him the place of president.

Up to the time of his appointment as general manager, Mr. Robertson had worked so silently for so many years at Denver as to escape the attention of practically all but his friends and immediate associates. He was born in Cheyenne, Wyo., on May 23, 1878. When he was only three years of age the family moved to Denver, and he has been there ever since. After finishing in the public schools he was graduated from West Denver High School, and in due time walked from the University of Colorado's Law School carrying his sheepskin. This was in 1901. He lost no time in having a gold-lettered sign printed, but went to work in the claim department of the Denver Tramway. Two years later he joined the legal department as an assistant to C. J. Hughes, Jr., the general counsel. In 1908 he was appointed general attorney, serving with Gerald Hughes, who had succeeded his father as general counsel.

Those who know the man well realize that he will do just as he says, namely, try to give the people of Denver a first-class service. Mr. Stenger was never able to do for Denver all that he had hoped to do, but nobody will ever accuse him of not having tried. Neither is it ever likely to be said of Mr. Robertson that he did not try. Not all of us realize our ideals. It is not fair to hold a man to accountability for that, but it is reasonable to hold a man to accountability in so far as he does not apply his talents to the fullest extent in the effort to attain the ideal. Judging the man from past experience, Denver will never have cause to complain about Mr. Robertson on this score.

C. A. Babtiste Retires from "Journal"

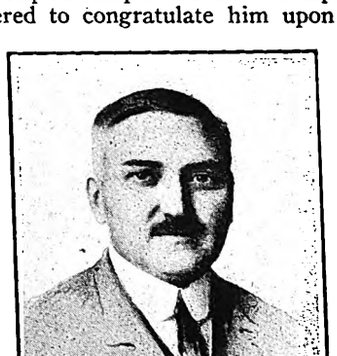
Carl A. Babtiste has resigned as New York district manager of the ELECTRIC RAILWAY JOURNAL and *Bus Transportation* at the suggestion of his physician and the solicitation of his family so as to rest for a period and then devote himself to his avocations. Mr. Babtiste has been actively associated with the McGraw-Hill Publishing Company, Inc., without interruption for 28 years. Up to the very day of his resignation he had always been a consistent business builder and, what is even more important, an institution builder. With him the company always came first. Perhaps that is why he was always so happy and so successful in his work. One thing is sure. For perseverance, loyalty and capacity to produce, he has always upheld the very highest ideals of the McGraw-Hill organization.

Associates of his on the ELECTRIC RAILWAY JOURNAL, officials of the McGraw-Hill company and a few intimates gave expression to these sentiments at a farewell luncheon at the Engineers Club, New York, on July 7. About four years ago, at the completion of 25 years of service with the company, James H. McGraw tendered a dinner to him, at which his services were substantially recognized.

Effective July 15 T. F. Mueller, long associated with the business staff of the ELECTRIC RAILWAY JOURNAL, will take over the sales territory, or its equivalent, made vacant by the resignation of Mr. Babtiste.

Friends Honor R. T. Senter

In a testimonial dinner at the Ritz-Carlton Hotel in Philadelphia on July 7 friends of R. T. Senter, president of the Philadelphia Rapid Transit Company, gathered to congratulate him upon his elevation to the presidency of the P.R.T. and to wish him well in his new post of broadened responsibilities. Prominent railway executives, leading citizens of Philadelphia and officials of his own organization joined in extending their good wishes.



R. T. Senter

E. A. Ballard, chairman of the dinner committee, acted as toastmaster. Among other things he said:

The greatest asset in the world is friendliness—the power to make and to hold friends. Among his many technical and executive qualities, Ralph Senter makes friends wherever he goes and draws them close with bonds that strengthen with time.

By his own chief, T. E. Mitten, president of Mitten Management, Mr. Senter was characterized as the "pinch hitter" of P.R.T. Mr. Mitten said:

We depend on him to deliver when others fail. Though one of the country's greatest engineers, Mr. Senter is practically self-educated. He has grown up with us. While possessing technical knowledge and judgment surpassed by few men, he has at the same time the human qualities of executive ability and friendship which make him the logical man to head P.R.T. at this period, when the primary object of our company is to establish closer bonds of friendship with our patrons and our public.

Other speakers included L. S. Storrs, W. G. Gove, C. C. Pierce, Judge W. J. Conlen, R. P. Hooper and Mr. Senter.

Mr. Storrs said that "Mr. Senter's background of technical and disciplinary training furnished an ideal foundation for his present position of executive responsibility." Mr. Gove expressed satisfaction at the appointment of a

Digitized by Google

technical and mechanical man to the post of chief executive. He testified also to the ability and sterling qualities of the new president. Mr. Pierce, Mr. Conlen and Mr. Hooper joined in attributing Mr. Senter's elevation to sheer merit. "He has paid the price of his success in hard work," was the keynote of their remarks.

Mr. Senter has been associated with Mitten Management for 28 years. He was born in 1876 in Columbus, Ohio. He was educated in the public schools of that city, Michigan Military Academy and the University of Michigan. His engineering education was obtained at Armour Institute of Technology and his practical experience with the Twin City Rapid Transit Company, International Railway, Chicago City Railway and Philadelphia Rapid Transit Company.

Paul D. Cravath Acting Chairman of Westinghouse

Following the annual stockholders' meeting, the board of directors of the Westinghouse Electric & Manufacturing Company met on July 6 for organization. The board re-elected the existing officers, except that, in view of the death of its late chairman, General Guy E. Tripp, it elected as acting chairman Paul D. Cravath, a director and for upward of thirty years general counsel of the company, to serve until the election of a permanent chairman. It was stated on behalf of the executive committee that it had no one at present in view for that office. The following resolutions were adopted in memory of General Tripp:

It is with profound sorrow that we record the death on June 14, 1927, of our friend and chairman, Guy Eastmann Tripp. General Tripp was elected chairman of the board of directors of the Westinghouse Electric & Manufacturing Company on Jan. 10, 1912, and served continuously in that capacity until his death. The qualities of leadership, courage, judgment and human sympathy which he possessed to such an extraordinary degree created for him a place in the esteem and affection of his associates and friends which it is given few men to enjoy. The company has lost a great leader, and we, together with all who have been privileged to know him and work with him, have lost the inspiration of a helpful, firm and loyal friend.

As a tribute of respect to his memory, which will always remain a most cherished possession, and in token of sorrow for his decease, the board of directors order this minute entered on the records and a copy thereof, suitably engrossed, sent to the family of General Tripp with an expression of deep sympathy in their loss.

J. W. Howard, general superintendent of the Galveston-Houston Electric Company, which operates the interurban line between Galveston and Houston, Tex., has gone to Lowell, Mass., to become sales manager of the Lowell Gas Light Company. This is the third promotion for Mr. Howard within the last six years. He is now only 28 years old. In 1921 Mr. Howard was graduated from Stevens Institute at Hoboken, N. J., with a degree in mechanical engineering. He started as a student engineer with Stone & Webster and his rise has been rapid. His first important post was as industrial engineer of the Pawtucket, R. I., Gas Company. From Pawtucket he went to Houston as general superintendent of the Galveston-Houston Interurban.

E. A. Cordell has assumed his new duties as traveling passenger and freight solicitor for the Illinois Traction System in St. Louis, Mo. He formerly was in a similar position at Bloomington, Ill. The latter post has been filled by Harold U. Jolly, who was with the I.T.S. at Peoria for eighteen months prior to moving to Bloomington.

OBITUARY

Percy Warner

At dawn on Sept. 20, 1863, an old blind mule was hitched to a covered wagon near Chattanooga, Tenn., so the story goes, and the Warner family, hearing the strains of "Yankee Doodle," started out on a perilous journey. One occupant of that vehicle was Percy, then two years old. The hardships of that immemorial peregrination revealed the courage and forbearance of the travelers, yet the arrival in Nashville was quiet and unceremonious. For one of the principals in that early migration the final lap of the journey was completed on June 21, when Percy Warner was conducted to his final resting place at Mount Olivet Cemetery. The same simplicity attended the final journey and the same flair for courage was somehow discernible in his descendants. Nashville mourned quietly for the man who played so active a part in the commercial and civic life of the community, who had left his impress on the very contours of the country and the compass of whose heart had stretched into many and varied Southern circles. Electric railway cars were halted, flags were at half mast and ball players stood in reverential silence to give a last tribute.

One of Percy Warner's notable successes was the Nashville street railway property. He became receiver of the company in 1902, effecting a reorganization in 1903. Later the present Nashville Railway & Light Company was to emerge with Mr. Warner as president. He retained this post until 1914. From a utility company of 60 cars and 62 miles of track he converted it into a public service system of 125 cars and 105 miles of track. He seemed to anticipate the present-day slogan for better and more comfortable cars and improved track. Other railway properties, namely those in Birmingham and Chattanooga, also claimed his attention.

Since 1914 Mr. Warner had been connected with utility development over the entire South. He was interested in hydroelectric power. But that again was only one of the many interests of the man. Early in his career he devoted his energies to the mining and furnace business with his father and elder brother. He became general manager of the Aetna Iron Company and the La Grange Furnace Company.

In 1925 he was elected a member of the city board of park commissioners. He had already built up Glendale Park, a project owned by the Nashville Railway & Light Company. His idea was to surround the city of Nashville with a chain of parks linked by a scenic roadway.

News of his death brought tributes from all over the South, from the lowly negro to the aristocratic Tennesseean. As one of the old-timers on the cars put it, "He's been the inspiration for dozens of improvements that people will never know of, and if he lived, there's lots of things he would have done yet. . ." It was only after his sudden death that a few friends who were with him at the recent convention of the National Electric Light Association at Atlantic City recalled that he had complained of a slight affection of the heart. But with his usual habit of self-effacement he declined to talk of it. He had gone to New York after the Atlantic City convention to confer with an anonymous donor of $50,000 in paintings and art pieces for the Parthenon in Centennial Park. He had returned on June 16 and he died on June 18, before he could inform the other members of the park commission at Nashville of the results of the journey.

William Charles Kidd

William Charles Kidd, sales representative of the Ramapo Ajax Corporation, Hillburn, N. Y., and secretary-treasurer of the Track Supply Association, died at his home in Suffern, N. Y., on July 5 following several months' illness. Mr. Kidd had been known intimately for many years by many railway and supply company representatives. He was born on April 23, 1858, in Burnley, England. In 1881 he went with the Ramapo Iron Works, now the Ramapo Ajax Corporation, at Hillburn as a machinist, in which capacity he was instrumental in the development of the Ramapo automatic switch stands. Later he was taken into the sales organization of the company, where he had been for more than 25 years. Mr. Kidd was particularly active in the Track Supply Association, an organization of supply concerns which exhibits at the Roadmasters' annual convention. In 1921 he was instrumental in organizing the Metropolitan Track Supervisors' Club of New York, and until early this year was secretary-treasurer of the club. At the time he relinquished this office he was made honorary secretary and treasurer of the club for life.

Manufactures *and the* Markets

110,032 Sq. Ft. Sold by A.E.R.A.

Exhibit to open Saturday noon, Oct. 1, and it is predicted that it will break all records

SINCE the exhibit committee of the 46th annual convention of the American Electric Railway Association met in Cleveland on June 22 and assigned 108,272 net square feet to 226 exhibitors, reports from Fred C. J. Dell, director of exhibits, have raised these figures to 110,032 net square feet to 235 exhibitors, which are exclusive of any track space for the display of street cars. The space demand has exceeded all expectations.

Three months still remain before the opening of the convention. Experience has shown that space applications pour in at association headquarters all summer—in fact, until just a day or two preceding the opening. There are always the last minute applicants to be cared for, if possible. When the 1926 convention opened there was a waiting list of more than twenty concerns that had applied and which it had been impossible to care for. Present indications point to a similar condition this year, except that the list will be larger.

When discussing the situation Direc-

List of Exhibitors Assigned Space for A.E.R.A. Convention by Exhibit Committee, June 22

Name	Booth Number
Adams & Westlake Co.	407
Ahlberg Bearing Co.	674
Aluminum Company of America	143 - 145

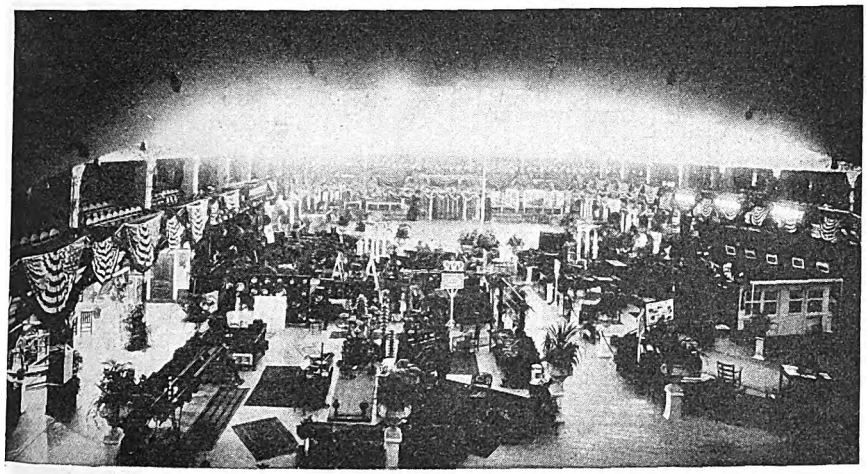
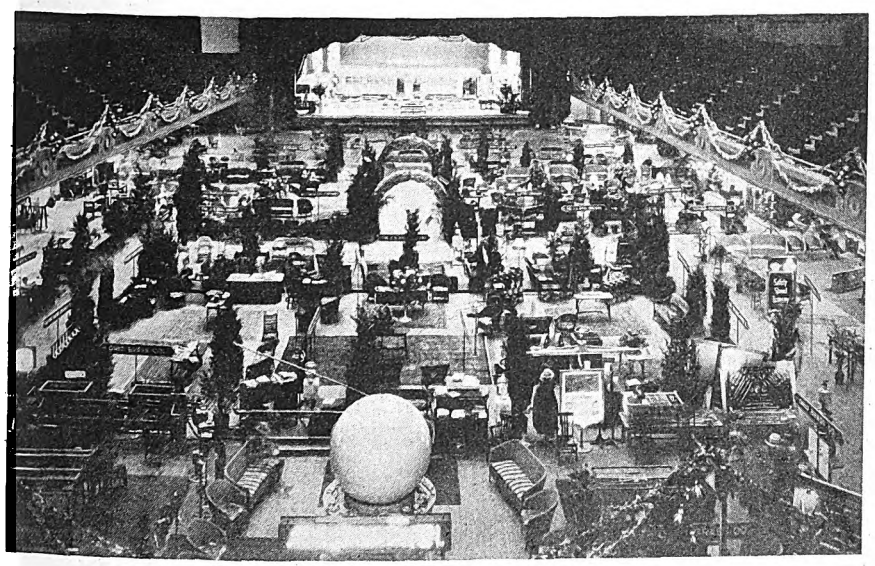
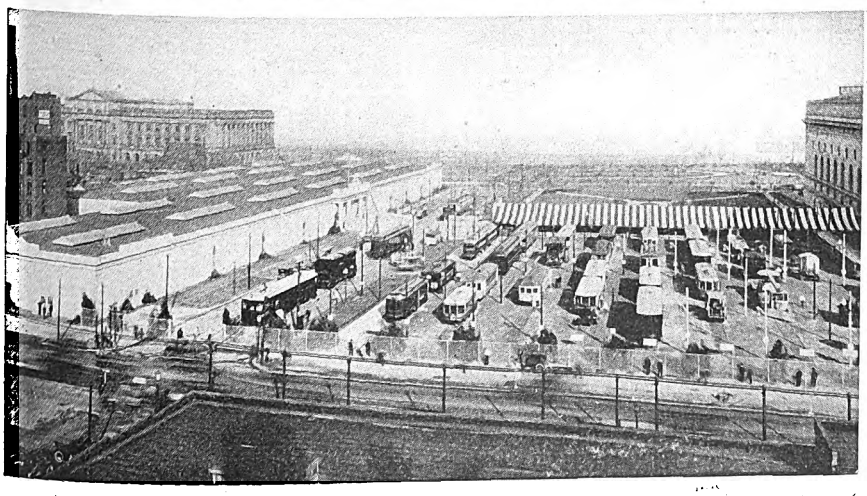
COMPARISON OF ATTENDANCE AT EXHIBIT CONVENTION OF A.E.R.A.

Year	Location	Convention Registration	Manufacturer Company Members	Number of Exhibitors	Total Space Sold, Sq.Ft.
1916	Atlantic City	3,271	208	125	57,329
1919	Atlantic City	3,166	206	157	62,219
1920	Atlantic City	3,300	200	136	59,529
1921	Atlantic City	1,189	225	No exhibit	No exhibit
1922	Chicago	4,200	244	141	61,895
1923	Atlantic City	4,404	274	162	75,681
1924	Atlantic City	5,804	330	192	86,349
1925	Atlantic City	7,147	371	204	100,030
1926	Cleveland	8,623	423	271	119,007

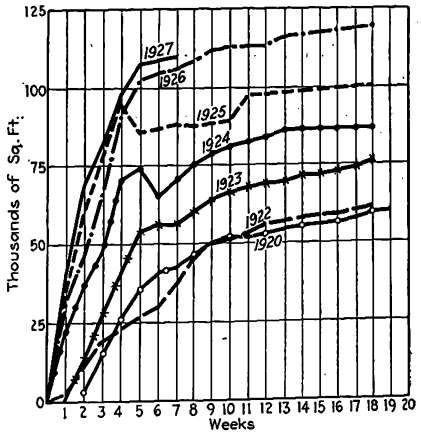






Ten years of progress!

The upper view shows the Atlantic City exhibit of 1916. In the two other pictures will be seen what the manufacturers exhibited at Cleveland in 1926. It is a story of 57,329 sq.ft. against 119,007 sq.ft. Here is conclusive proof of the growth of the industry during an epoch as tense and disquieting as any in American history. Producer and consumer alike have expressed their faith through the years.



A graphic illustration of what exhibit committees have wrought in seven years

tor Dell pointed out that "many a sales manager has questioned the advisability of participating in exhibits. The convincing argument to his question is found in the facts: A.E.R.A. attendance records at conventions with exhibits as compared to registration figures at conventions where no exhibits were held is the answer. The tabulation given elsewhere is a most eloquent argument for exhibits. In making up this tabulation the war years of 1917 and 1918, when only conferences were held, have been excluded."

Westinghouse Favors Newspaper Publicity

J. C. McQuiston of the Westinghouse Electric & Manufacturing Company in an address before the International Advertising Association convention at Denver, June 28, said that his company favors the newspapers to get its story before the public and to secure the good will of the people, which is of paramount importance. He said, in part:

Take, for instance, the electric railway business, which is an important branch of the electrical industry. It is quite as important to Westinghouse to have the public in friendly sympathy with the street railway companies as it is to the street railway companies themselves, for our prosperity depends upon the prosperity of the electrical industry in its entirety. The street railways have a wonderful story to tell the public. Many of us remember the old horse-drawn street car with straw on the floor to keep the car warm. Transportation was slow, distances traveled were short; of comforts there were none, and still the price was a nickel a ride. Then came the cable car with longer hauls, faster time and somewhat more comfort, and still the fare was a nickel. Then came the advent of electricity, until now the cars offer great distance, rapid speed and every convenience of travel and still the public is inclined to complain if the fare exceeds the proverbial nickel.

He mentioned other innovations in the electrical industry, and while the public may take exceptions to charges now and then, it will be inclined to receive increases or decreases more gracefully when it is fully and properly advised about them.

Six One-Man, Two-Man Cars for East St. Louis Railway

As reported in ELECTRIC RAILWAY JOURNAL for May 28, the East St. Louis Railway, East St. Louis, Mo., has ordered six one-man, two-man, double-end, steel units. Contract was placed for these cars on May 24 with the St. Louis Car Company. Subjoined are preliminary specifications. These units are a part of the company's program for modern rolling stock and they will augment the units recently rebuilt and placed in service on May 11. Full details of the rehabilitation program were presented in the JOURNAL of June 4, page 1,000.

Number of units	5
Type of unit	One-man, two-man, motor, passenger, city, double-end, double-truck
Number of seats	48
Builder of car body	St. Louis Car Co.
City and state	St. Louis, Mo.
Date of order	May 24
Date of delivery	October, 1927
Weight	Approximately 32,000 lb.
Bolster centers	22 ft.
Length over all	47 ft. 3 in.
Length over body posts	31 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	10 ft. 6 in.
Window post spacing	2 ft. 6 in.
Body	All steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse
Axles	Heat treated
Car signal system	Faraday
Compressors	DH-16
Control	K 75-low level
Curtain fixtures	National Lock Washer
Curtain material	Pantasote No. 86
Destination signs	Hunter
Door mechanism	National Pneumatic
Energy saving device	Economy meters
Finish	Enamel
Floor covering	Linoleum
Gears and pinions	Tool Steel Gear & Pinion Co.
Glass	Plate in side windows; non-shatterable in vestibule
Hand brakes	St. Louis Car Co.
Hand straps	Electric Service Supplies No. 26572
Heaters	Consolidated
Headlights	Golden Glow
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain, 3¾ in. x 7 in.
Journal boxes	St. Louis Car Co.
Lamp fixtures	Safety Car Lighting, dome fixture
Motors	General Electric No. 264, inside hung
Sash fixtures	Dura
Seats	St. Louis Car Co., leather reversible
Seat spacing	30 in.
Seating material	Genuine Spanish leather
Steps	Folding
Step treads	Feralun
Trucks	St. Louis Car Co. EIB 64
Ventilators	Nichols Lintern
Wheels, type	Rolled steel, diameter 26 in.
Special devices	Oakelite; National Pneumatic treadles; variable load brake

Roy Hauer Made Mack Vice-President

Roy A. Hauer, manager of the general bus department of the Mack-International Motor Truck Corporation, New York City, has been elected a vice-president of the company. He will continue as general manager of the bus department. Mr. Hauer has been with the company many years and has filled various positions in the field and at the head office.

The Mack company announces also the election of A. C. Fetzer, assistant general sales manager; J. N. Bayne, Newark branch manager; K. M. Blake, New York branch manager, as vice-presidents. Mr. Bayne and Mr. Blake will head the North Jersey division and Greater New York division respectively. O. J. Evers was also elected a vice-president. The elections were effective July 1. William R. Rhoades has been appointed branch manager of the Scranton sales and service branch. The Albany, N. Y., branch of the company has moved from 135 Ontario Street to 1062 Broadway, a new building constructed and owned by the Mack company. This is the fifteenth branch to occupy its own building since this real estate policy was put in force by the company some time ago. The new building on Broadway occupies 56,414 sq.ft. of floor space. F. F. Staniford is manager.

Una Sells Bond Business to Ohio Brass

The Una Welding & Bonding Company, Cleveland, desiring to concentrate its efforts in the commercial and industrial welding field, has sold its rail bond business to the Ohio Brass Company. This includes the entire rights in and to all patents covering the various types of bonds and bond welding processes developed by the Una company and the exclusive right to sell and use the Una welding rods in connection with rail bonding. The patents covering rail joint welding were not included in the sale nor the Una dynamotors.

It is understood that the Ohio Brass Company will continue to supply the field with the various types of Una bonds. This will enlarge the line of bonds available from the Mansfield manufacturer.

Copper Moves in Dull Market

Until July 6 the non-ferrous metal markets had been generally dull, with tendencies toward weakness. On Wednesday, however, an unusually large business was done in copper at 12.50 cents and producers seem confident that a buying movement has started. Lead has been quiet and prices are lower than a week ago. Much the same situation exists in zinc, silver, tin and quicksilver.

Copper producers, according to *Engineering and Mining Journal*, who have been virtually out of the market, quoting nominally 12.625 cents or higher, with one or two possible exceptions, came to the 12.50 cent level July 6. On the other hand, consumers who had hoped to break through the 12.50 cent figure have had little success, although at least one good-sized sale was made at 12⅜ cents for delivery in the New York district and a still larger tonnage was booked for delivery in the so-called Middle West at 12.50 cents. With excellent buying for Connecticut delivery at 12.50 cents today, it seems as though the events of last February and April, when bottom was touched at this figure, have been repeated. Most of the orders today have been for August and September delivery, with a lesser quantity for July.

Five successive days of lower lead prices in London made it necessary for prices on this side to be cut also if foreign ore lead were to be kept out of the country, so the American Smelting & Refining Company reduced its contract price of New York lead from 6.40 to 6.30 cents on Friday, July 1.

Sales of zinc in the domestic market have been in less than normal volume and prices are easier than a week ago. At the same time producers have not endeavored to force an unwilling market, and the decline in price has been comparatively small. There is little profit to be made in smelting $41 and $42 concentrate and selling slab zinc at 6.10 cents and 6.15 cents, and for this reason producers prefer to hold their metal. Mine production in Joplin should be particularly small this week, for the reason that many of the largest properties were closed down for four days or more over the holiday.

The premium on spot and prompt tin continues to decline, October deliveries being quoted July 6 at only about 1¼ cent below spot Straits. The visible supply of tin in the United States was 8,724 long tons at the end of June, compared with 7,709 at the end of May; and in the world, 15,638 long tons, compared with 14,655 a month before. The June shipments of 10,681 long tons were divided as follows: Straits, 7,607; Banka, 1,418; Standard, 1,251; Chinese, 291, and Australian, 114.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	July 5, 1927
Copper, electrolytic, cents per lb.	12.20
Copper wire, cents per lb.	14.50
Lead, cents per lb.	6.30
Zinc, cents per lb.	6.47
Tin, Straits, cents per lb.	64.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.32
Somerset mine run, Boston, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	2.02
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons.	†
Kansas screenings. Kansas City, net tons	2.67
†Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.15–5.20
Weatherproof wire base, N.Y., cents per lb.	16.00
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.1
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.00
Turpentine (bbl. lots), N. Y., per gal.	$0.57

TRADE NOTES

MARSHALL ELECTRIC COMPANY, formerly of St. Louis, is occupying its new factory at Elkhart, Ind., removing its assembling plant and main offices to the Indiana location, where the headquarters, as well as the factory, will be housed. The company is only five years old, but claims the distinction of being the pioneer manufacturer of constant potential battery charging equipment. Thomas Marshall, Chicago, is president. G. H. Fournier, an electrical engineer, is vice-president and general manager.

SHOPS AND BUILDINGS

SPRINGFIELD STREET RAILWAY, SPRINGFIELD, MASS., is remodeling its building in Bond Street, formerly used as a freight terminal, into a garage for its buses. A repair shop and laundry will be included in the establishment. The improvements on the building will cost $15,000.

An Exhibit for the Maintenance Man

INTEREST in this year's exhibit at Cleveland increases apace. Each day's development points more clearly toward the greatest convention and the most impressive electric railway exhibit of all time. But for the maintenance man this year's convention holds a particular appeal.

During the year discussion of car improvements has become transformed into action. Within the period of the past few months there have been formulated by practically every car builder in the industry plans for developing and exhibiting radical changes from conventional designs. New manufacturers have come into the field and, in addition, many operating companies have gone ahead with experimental work in the improvement of cars. Practically every outstanding development of this kind is expected to be in the exhibit.

Interest in the improvement of cars has been reflected to track and overhead line. In fact, there is considerable evidence that the track manufacturers have been the most alert of all to identify themselves with the demand throughout the industry for better transportation. Improvement of line practice is also entitled to careful study and attention.

For the maintenance man in particular this year's convention should prove a literal mine of ideas and suggestion. It is important that the cost of staging such a stupendous exhibit as this be capitalized to the limit by every man who has the opportunity to attend.

Making Questions Help Standardization

QUESTIONS are being asked so frequently by maintenance men regarding details of repair shop practice, particularly on such subjects as tolerances of refinished parts, that it would appear sufficient attention is not being given to the work of the American Electric Railway Engineering Association. This body, through its technical committees, has done and is doing much to standardize the methods employed in the maintenance and repair of cars, track, line and all other elements of the electric railway plant.

That acceptance of the practices recommended by the association is not universal is indicated by the diversity of replies given by various operating men. Some of them, of course, have practices which have been established over long periods and do not feel that it is necessary or desirable to change. Others, however, are not familiar with the work of the committees and the range of subjects covered in the Engineering Manual, and for that reason are not conversant with the best and latest developments. It is to be noted in this connection that the personnel of the committees includes many men connected with small and moderate-sized properties as well as the largest ones, so that the recommended practices promulgated by them are almost invariably suited for railways large or small.

The association has progressed much in its work. It is even now planning for greater effectiveness, so that standardization of materials, methods and practices can be carried along and always brought up to date as the industry progresses. Questions dealing with practices not already standardized can be of great help to the committees, as they should bring out answers from many operating men that will put before the industry the diversity of methods and will suggest the best means of standardizing.

There Are Many Causes for Flashing of Railway Motors

MANY master mechanics remember the time when the lathes in electric railway shops were kept busy turning out flat spots in commutators. Slotting of commutators and the use of higher grade carbon brushes have overcome this condition. Now that commutator slotting is used so universally, it is difficult to believe that its desirability was ever questioned. The issues of ELECTRIC RAILWAY JOURNAL 25 years ago, however, contain many articles in which the question is debated. Even the engineers of railway motor manufacturers were against the practice of slotting, the argument being that the slots would be sure to collect carbon dust soon and cause short circuits and more trouble than the flat spots that resulted from high mica.

Slotting of commutators has not overcome all railway motor flashing, however, as is pointed out in the article by Jesse M. Zimmerman in this issue. Flat spots sometimes occur on commutators, but now they are the result of poor maintenance. Carbon dust does accumulate and cause trouble, but ordinarily there is no excuse for such conditions, as motors and brush-holder mechanisms can be blown out with compressed air as a part of regular inspection if necessary, and so be kept clean easily.

Poorly maintained brush-holders are responsible for many present-day motor troubles. Sparkless commutation requires that the brushes and commutator keep in continuous contact, with sufficient pressure to permit carrying the maximum current that results from an overload. Dirty brush-holder mechanisms, tight carbon-brush boxes, weak spring tension and shortness of the carbon itself cause sluggish action of the brushes so that they hit the high spots of the commutator only.

The other extremes of worn carbon boxes, loose brushes, heavy brush tension or brushes too long to act properly cause just as much trouble. Looseness permits the brushes to swing off neutral and sparking results. Improper alignment of the brush-holders or incorrect spacing has the same effect.

This is the issue in July that is devoted essentially to maintenance and construction subjects

Digitized by Google

Commutator troubles and flashing do not always come from an improper condition in the motor. Anything that produces motor vibration will result in poor commutation. Flat wheels, poor track, improperly adjusted or faulty brake rigging, poor motor suspensions and loose bearings are some of the contributing causes, but all can be overcome easily with proper attention to the maintenance of all car equipment parts.

Contact Lines, Too, Need Modernization

WITHIN the past few years much has been published about modernization of cars and service. Occasionally an article has dealt with modernization of the track. The overhead contact line, on the contrary, has received little or no consideration from the engineers and operators who are preaching the doctrine of fitting the electric railway to present-day conditions. For this reason, if for no other, the article by L. W. Birch appearing in last week's issue of this paper is worthy of study.

Close scrutiny of Mr. Birch's article reveals that it is possible to revamp the trolley system and fit it for high-speed operation at slight expense. It may be surprising to line engineers of the old school to learn that half of the poles of an existing direct suspension overhead system can be removed to the benefit of the line. The cost of material for conversion to the catenary system is surprisingly small, as the article brings out; in fact, the annual cost may be reduced after the change is made.

As to the merits of the catenary suspension there is little argument. It has been developed so that it is suitable for much higher car speeds than was the direct suspension. Hard spots in the wire are absent and hence trolley wheel wear is lessened. The maintenance of the trolley wire should be reduced for the same reason. When one reads of the advantages it seems the more surprising that all the interurban lines and many city properties have not adopted the plan. To say the least, it merits careful scrutiny by every operator of an electric railway with an overhead contact line.

To Be Attractive, Service Must Be Competitive

WHILE on a recent motor trip the writer drove his automobile for a considerable distance along a highway paralleling an interurban electric line. The railway track was on a private right-of-way and was laid with rail of fair weight. There were no grade crossings. Stopping places were not so close together that moderately high speed would have been impossible. The car was modern and should have been able to make good time. Yet its speed, as measured by the speedometer of the automobile alongside, never exceeded 30 m.p.h. The automobile could have been driven considerably faster, even though there was a great deal of traffic on the highway.

Inquiry developed that there is a second rail route between the terminal cities which the company adopted as its high-speed line, reserving the one in question for local traffic. The curves on the latter are not banked for high speed and the track is not maintained well enough to make high speed practicable. But that must be looked on more as an excuse than a reason for the slow speed. If the track maintenance is not good enough to permit of high speed under conditions such as this it is not acceptable to the patrons who must use the road, nor is it good enough to obtain economy in operation, as the slight saving in repairs will be eaten up in higher car maintenance cost. Certainly there was an opportunity to make better speed if the car had been accelerated and braked quickly, even though higher maximum speeds could not be attempted. While the public conveyance which must stop for passengers cannot hope to make the same speed as the individually owned vehicle making no intermediate stops, it has the advantage of a private right-of-way which permits of higher speed while it does run, and the passengers at least can get a thrill out of passing the vehicles on the adjoining congested highway. By making the best speed possible, certainly no passengers will be driven away and others undoubtedly will be attracted. Operating expenses can be but little higher and if the schedule can be adjusted so that a car is saved costs will be materially reduced.

When interurban railway managements learn to understand better the public's desire and demand for getting somewhere quickly, and make it appear that they are straining every nerve to make speed, eliminate waste time and get the patron to his destination on the minute, there is likely to be a change in the belief that the interurban is doomed. Those few roads that have such a policy of appealing to the public have found that it pays.

Another Interurban Stops Drifting

ON APRIL 27, 1926, the Cincinnati, Hamilton & Dayton Railway acquired, through foreclosure, an interurban property that had been in continuous receivership for ten years. To be exact, it acquired 72.95 miles of interurban trackage running through the Miami Valley, from the outskirts of Cincinnati to the heart of Dayton, Ohio, and 13.8 miles of trackage used in giving local street car service in Hamilton, Ohio, a city of approximately 50,000 population. Beyond this and the traffic possibilities of the rich Miami Valley—which have existed for many years—it acquired little more than an obsolete, run-down and decrepit interurban infested with bus competition and ready for the scrap pile. The receiver had heroically endeavored to plow back its limited resources into tie and rail replacements needed to avoid a total suspension of service. The right-of-way had become grass grown and weedy. The cars in use were from thirteen to 30 years old. Most of them were obsolete, uncomfortable and uninviting and excessively costly to operate and maintain. The power supply was likewise obsolete, unreliable and inefficient. The shops were inadequate and crude.

In short, the C., H. & D. acquired a run-down interurban property, which if not typical of many similar properties in the country had at least much in common with them so far as general condition, history and outlook are concerned. Like many similar properties, also, it was the victim of a series of financial manipulations —leases, mergers, consolidations and "recapitalizations" —which loaded upon it a staggering burden of fixed charges and resulted in prolonged litigation among its mortgage creditors.

On June 22, 1927, the Cincinnati, Hamilton & Dayton Railway staged a mammoth civic celebration, which, as reported in the June 25 and July 2, 1927, issues of ELECTRIC RAILWAY JOURNAL, attracted a crowd of people conservatively estimated to have exceeded 25,000, and including financial, business, industrial and civic

Digitized by Google

leaders from the entire Miami Valley, together with many leading executives of the electric railway industry. Automobiles blocked the highways for miles in a vain effort to reach the place of the celebration. Residents in all the towns along the line turned out in force to wave and cheer as the company's cars carrying civic leaders passed along the streets. Motormen and conductors alike threw back their shoulders and held up their heads with new pride in their jobs. Newspapers throughout the territory and in many other parts of the state devoted many columns to laudatory comment about the road. Congratulatory letters and telephone calls poured in on the management from prominent people in the territory and the industry.

What had happened in the short period of barely more than a year? Did some fairy wand transform this tottering and cadaverous "streak of rust" into a modern, efficient and popular transportation machine capable of playing a vital and welcome part in the development of the Miami Valley? No, there wasn't anything magical about it. There wasn't anything much different than has brought the same complete reversal of outlook on other interurban properties; on the Chicago, North Shore & Milwaukee Railroad, on the property of the Interstate Public Service Company, on the properties in the South and Southwest under the management of Stone & Webster, on the Buffalo & Erie and on the Chicago, Aurora & Elgin, where Dr. Thomas Conway, Jr., J. H. McClure and their associates, who are now engaged in rebuilding the C., H. & D., brought a tottering railway system from receivership to prosperity and financial credit in three years. A management took charge of the property which had the vision to foresee its possibilities, the courage to spend good money in developing them, and—to furnish the necessary motive and incentive—a direct financial interest in the result.

No, there wasn't any magic. It was only hard business sense. There was confidence in the transportation business. There was foresight. As a result, another interurban has stopped drifting. Those at the helm are steering the only course that lies open to a larger destiny. In their example there is something serious for those to think about who cover up their own timidity and inaction by reciting the difficulties of the interurban, instead of taking steps to surmount them.

Tragic Accidents—The Response to Summer Salvo

ONLY two weeks of the summer passing show—and observers already are turning away with horror from the diorama of tragic deaths due to careless accidents. Whether the 1927 canvass shows any more gruesome shades than in the years previous only the experts can answer. In any event, possible predictions of statisticians for the summer period ended Labor Day, based on the accident toll so far recorded, might well provoke foreboding, if it weren't for the opportunity afforded by a recent proclamation of Governor Smith of New York, and worthy of emulation by other state heads, setting aside three weeks beginning July 18 as Public Safety Period. The period was recommended for stress by teachers, public speakers and clergyman "to the end that greater success will attend the effort to reduce our accident hazard."

Though primarily addressed to automobile drivers, the appeal is really made to every operator of a vehicle in the entire transportation field. With all that has been accomplished in familiarizing the people with the safety language, in profitable rendezvous with Aunty Jay Walker and Mr. Will Livelong, it seems incredible that many people not only remain passive on this vital subject but also continue to turn a deaf ear to what is now a national entreaty. Tragedy, it appears, must make its foray onto their very hearths before preventive measures enter the process of their cerebrations.

ELECTRIC RAILWAY JOURNAL has talked "safety," and not in vain. Let the electric railways continue to make every year a banner safety year as well as a banner business year. The crucial season is on when week-enders are many and vacationists unguarded. Now is the acceptable time for every trainman worthy of his hire to assemble all his mental and physical forces in the expeditious, courteous and careful transportation of passengers to their destination. If recent tragedies in the air have provoked the question whether we are as yet prepared for such chances, no such debatable point arises concerning daring on the highway. Courage and recklessness are not one and the same. An impassable chasm separates them.

A Public Utility Should Set Good, Not Bad, Examples

DISCUSSION now raging in one of the suburbs of a large city is a warning that a public utility cannot be too careful about any acts that make it appear indifferent to the public welfare.

In this suburb growth has been very rapid in recent years. This led to a zoning act which would, as the British say, enhance the amenities of the town instead of making it less attractive. Particular care was directed toward making the business district one in which the run-down frame buildings of a past generation would be replaced by handsome, substantial structures. Much of this development is the main station and right-of-way of one of the railroads passing through the town.

With the coming of electrification it has been found possible to use part of the right-of-way for business buildings. The earlier constructions were entirely unobjectionable. Now a controversy has arisen because the real estate department of the railroad has leased space for a lunch wagon directly opposite the newest and finest building in the community's business center.

Now that protests against this cheapening of the neighborhood have been brought up to the board of directors, the apology is made that the lease was really handled through a local realtor, who might have been expected to know local sentiment. So far, however, the railway has not offered to remove the blotch by reimbursing the would-be restaurateur for his outlay. The latter, of course, has the law on his side, but the likelihood of a boycott should make him amenable to reasonable compromise.

This incident suggests how carefully a public utility should watch its step in any enterprise that contacts with good public relations. No matter how badly it may be in need of additional revenue, it cannot afford to permit itself to become embroiled with the communities through which it operates. It may "get away" with its legal rights today, but when it wants some favor tomorrow it will be astonished to find how many influential citizens have not forgotten that it set an example of bad—or at least indifferent—citizenship.

In the Wake of the Raging Torrent

NOW the Valley of the Mississippi is in the aftermath of the flood. Desolation stalks in the far reaches of the river that ran wild for weeks. The land of Evangeline is laid waste. As recently as July 1 Secretary Hoover estimated that 59 of the 101 counties inundated were practically out of the water, 22 were mostly out, but twenty were still under water. Approximately 3,500,000 acres of crops were destroyed by the high water, and of these 1,300,000 acres are in the twenty counties still inundated. Little can be done toward producing crops this year on the land now under water. This dire peace-time disaster has claimed a total of more than 600,000 sufferers, who must bear with property damage estimated to be between $200,000,000 and $400,000,000. Of the more than 600,000 persons who became dependent on public support, 555,000 have returned to their homes, leaving only 45,000 yet to be cared for away from home. There are still some 250,000 persons receiving temporary supplies of food, together with feed for their working animals.

THESE are the cold facts reduced to terms of acreage desolated, people prostrated, and money losses sustained. Back of them is the story of the fortitude with which the people are bearing their colossal losses. No other farm lands in America are richer than those in the Arkansas Valley. In the lower Mississippi cotton that should be waist high is only a few inches out of the ground. Corn, the tops of which under normal conditions should be from 5 to 6 ft. high, is less than a foot. It is not all quite so bad as this, but in St. Martinsville not a train whistle has been heard for nearly two months, and it was not until June 30 that automobile traffic there was possible. In the parish of St. Martins, the heart of the Evangeline country, hundreds waited in file on July 9 in the bread line before a garage which the Red Cross was using as its relief headquarters. The descendants of the Acadians are proud people. They were ashamed to be there, but there was no alternative. Nearly everybody had lost his all. Out in the open Father Peeters said mass in French. Only the fortitude of faith sustains many of them. It is against his will that the Acadian has had to become a ward of the Red Cross. Even Mr. Hoover has been unable to convince him that by so doing he did not become a receiver of alms.

But the work of succor is being carried on. The resources available for relief have amounted to approximately $26,000,000. Of this total $16,000,000 came through the Red Cross funds raised by popular subscription, $7,000,000 represents outlay of the federal government in equipment and supplies, and $3,000,000 represents free railway transportation of supplies. Of the Red Cross funds some $3,000,000 remains in a reserve which is expected to be sufficient to provide until the end of October for the needs of the twenty counties still flooded. An additional sum of $1,600,000 raised from various sources will be used for a campaign against malaria and other forms of disease to which the flood has made that region particularly susceptible.

WITH the slogan "Rally for Rehabilitation," the public utilities of Louisiana and Mississippi are actively co-operating with the agricultural and educational authorities of the two states to hasten restoration in the flooded sections. The medium for this work is "Miss Lou," the information bureau conducted by the utilities to tell the people the facts about their problems and progress, and to forward the prosperity of these states in every way. To this end the committee has employed W. I. Smith, a man thoroughly acquainted with the territory by birth and breeding, a trained writer, and an experienced teacher. He is now working under instructions from Prof. W. R. Perkins, director of Agricultural Extension at L. S. U., and Superintendent T. H. Harris, head of the public school system in Louisiana. The expense of this work is completely borne by the public utilities contributing to the Miss Lou Committee, of which H. B. Flowers is chairman and C. P. Couch vice-chairman. Both these men are well known in electric railway and other utility circles. They ask the full co-operation of all newspapers in both Louisiana and Mississippi and the aid of business leaders in the communities affected, to the end that farms and schools may be successfully rehabilitated without costly delay.

GRIEF, of course, is personal. It can be made endurable and prevented from becoming tragedy only as human agencies rise to a proper appreciation of the need of the work of succor. The agencies of mercy have done heroic service in the devastated area, but much still remains to be done. This is the reason for the plea of the representatives of the public utilities, "Rally for Rehabilitation!"

Five steel wheels are heated in the annealing furnace at once. This picture was taken by the light of the wheels and the interior of the furnace

Heat Treatment

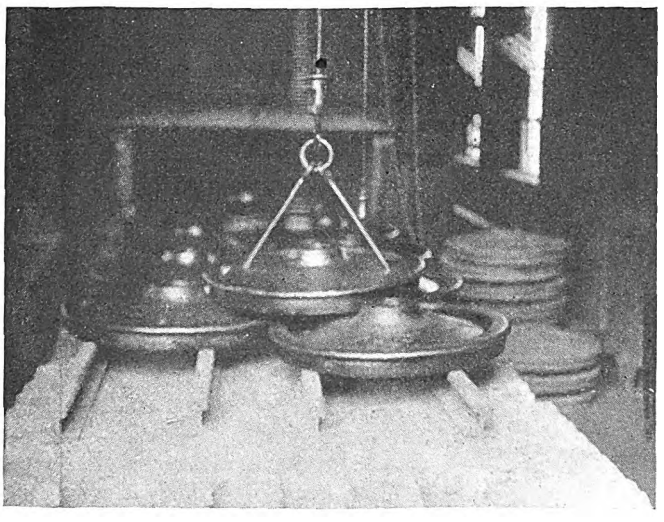
Eliminates Wheel Failures

Process of hardening and tempering rolled steel car wheels has been developed by Twin City Rapid Transit Company. Wear is reduced and so far no failures have occurred

HEAT treatment, which has been used quite extensively for car axles by the Twin City Rapid Transit Company, has within the past few months been developed for the preparation of new rolled steel car wheels. At present no wheels are being used without the treatment.

Prior to the adoption of heat treatment, there had been a certain amount of difficulty due to failures of the steel wheels, particularly during the severe winters that are experienced in Minneapolis and St. Paul. Usually a crack would begin at the periphery, extending to one of the four holes drilled in the web, after which the fracture might extend completely around the wheel unless detected during inspection. A few fractures also occurred in the hubs, although these were much rarer.

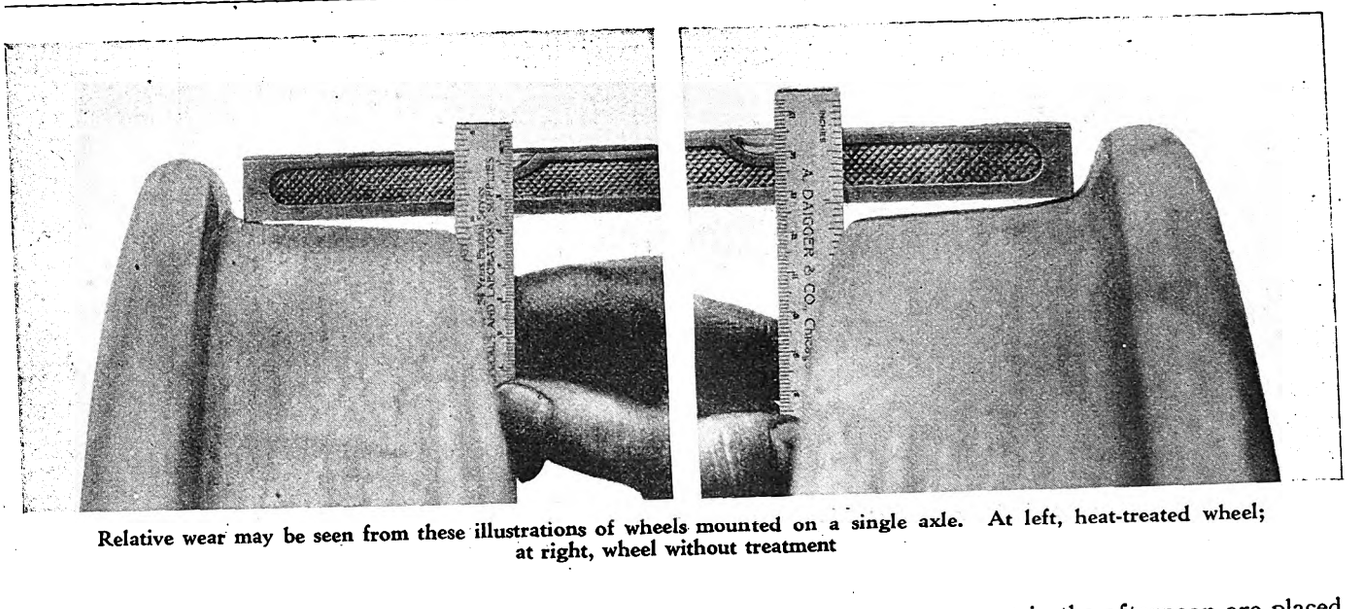
Ordinarily, the fractures in untreated steel develop soon after the wheels go into service. They become apparent at once or when the wheels are returned to the shop for truing up after the first 13,000 to 15,000 miles of operation. A few more become apparent after the second dressing at 26,000 to 30,000 miles. If the wheels have not failed at this point there is little likelihood that cracks will develop before the tread is worn out. Thus it would seem probable that failure is due to shrinkage strains set up in the metal in the process of manufacture rather than to any condition developing from operation under the car.



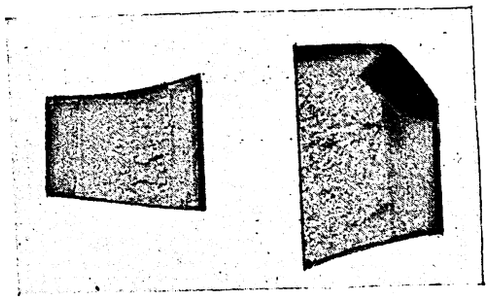
Ten wheels, after heating and quenching in oil, are placed on a truck and run into the annealing oven for tempering

Some four years ago the heat-treating process was worked out for axles, resulting in a marked reduction in failures and decrease of wear. Accordingly W. J. Smith, master mechanic, decided to develop a similar process for the treatment of rolled-steel car wheels. Approximately 1,000 wheels were

Digitized by Google



Relative wear may be seen from these illustrations of wheels mounted on a single axle. At left, heat-treated wheel; at right, wheel without treatment



Fractures of steel car wheels. At left, heat-treated metal; at right, metal without treatment

treated, and at present the first ones have seen 50,000 to 60,000 miles of service. As yet there has not been a failure of a treated wheel. This excellent record led to the decision to give heat treatment to all wheels used by the company.

A standard procedure for the preparation of wheels has been worked out under the supervision of David Tissing, testing engineer, which is as follows: The rolled-steel wheels, when received from the manufacturer, are stored in the yard adjacent to the furnace room so that they can readily be rolled in by hand. They are first placed in a furnace fired with crude oil and heated to a temperature of 1,450 to 1,475 deg. F. This takes about two hours. The temperature is watched carefully, being taken by a recording pyrometer. When the indication of the pyrometer shows that the proper temperature has been reached, the wheels are inspected by eye to see that all parts are evenly heated.

The appearance of the wheels in the furnace is shown in one of the illustrations. The wheel is quenched down to a temperature of 400 deg. in an oil bath, the oil being circulated by a motor-driven pump and cooled in a tank on the roof.

Following the quenching, the wheels are placed in an annealing oven and the temper is drawn by heating to 1,000 deg. This is controlled by a recording pyrometer and takes approximately two hours. The heat is then cut off and the wheels are allowed to cool for fifteen to twenty hours.

At present the schedule calls for treatment of twenty standard 34-in. wheels a day. The heating furnace holds a charge of five wheels. Two heats are made in the forenoon and the ten wheels are laid aside. The annealing furnace is opened after the lunch period at noon and the previous day's charge of ten wheels is removed, after which the new charge of ten wheels that were heated and quenched in the morning is placed on a truck and run into it. One of the illustrations shows the ten wheels ready to be run into the annealing furnace. The furnace is then sealed and the heating begun.

The ten wheels that have undergone the heating treatment in the afternoon are placed, after quenching, back into the furnace in which they were heated. The heat remaining in this furnace is sufficient to bring them up to the required temperature for annealing, so that additional heating is not required. They are allowed to remain in the furnace over night, and are ready to be withdrawn in the morning. In this way the heat is conserved and only half the heat is needed for the anneal.

Wheels produced by several of the leading manufacturers are being used. A typical analysis of the steel used shows the following composition:

	Per Cent
Carbon	0.73
Manganese	0.75
Phosphorous	0.037
Sulphur	0.034
Silicon	0.23

The change in physical properties incident to the treatment may be seen from the following comparative tests made on a typical wheel before and after treatment:

	As Received	Heat Treated
Tensile strength, lb. per sq.in.	125,600	158,050
Elongation in 2 in., per cent	10.5	13.5
Reduction in area, per cent	14.9	35.7
Brinell hardness index, front face of rim	260	311

The most marked change due to the treatment is the increase in ductility, as shown by the much greater reduction in area. The change in properties may also be seen from the illustrations. The fracture shows a striking reduction in size of the crystalline structure, indicating a more homogeneous material.

In regard to wear, the treated wheels have not been in service a sufficient length of time to get any average figures. For purposes of comparison, however, an axle was fitted with two wheels of identical make and composition, one of which was mounted as received from the manufacturer and the other first given the heat treatment. This set was placed on a car in service. Since the wheels had to rotate at the same speed, there was a tendency to equalize the diameters, although the wear at the outside of the tread was almost 50 per cent greater on the untreated wheel, as seen in the illustration.

Brush-holder for Westinghouse type 333 motor rearranged to use twin-washer mechanism

Good Maintenance Produces

Improved Commutation*

By Jesse M. Zimmerman

Renewal Parts Engineer

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

GOOD commutation means a reduction in operating expenses. Two of the benefits derived are: (1) Commutator and brush wear are less. In addition to the money saved on commutator and brush replacements there is a reduction in copper and carbon dust accumulation in the motor. This dust forms a good conductor and often causes the insulation of the armature or field coils to break down; (2) roughening of the commutator is avoided. A rough commutator causes vibration which leads to unnecessary wear of the brush-holder as well as chipping and breaking of carbons.

Good commutation can be obtained only by eliminating flashing and sparking. Flashing is caused by the establishment of an arc between the brush or brush-holder and a commutator bar, and which is maintained by a high voltage. Since an arc always vaporizes the copper where it starts, it will stick to that bar. As the rotation of the commutator carries the bar away from the brush-holder, the arc either is extinguished when the distance is so great that the voltage cannot maintain it or when the voltage behind the arc is great enough it carries over to the brush-holder of the opposite polarity. It is the purpose here to deal with the mechanical causes of these arcs and not with the theoretical principle involved.

If it were possible to eliminate all sparking and arcing from the commutator face one could feel very much at ease concerning motor flashing. Many cases of flashing have been eliminated by proper maintenance of brush-holders or by increasing the brush tension, if the field and armature coils are installed correctly with no shorts or open circuits, and the control circuit is connected properly. Broken brush springs and sluggish mechanisms are serious offenders, as they allow the brush to leave the commutator face when the motor is running at high speed over a rough track. All brush springs should be inspected carefully and replaced if broken or weak. If the mechanism is sluggish it should be removed so that the moving parts can be cleaned, and all badly worn parts should be replaced. Usually the brush tension should be set from 5 to 7 lb. per square inch, sometimes as high as 10 lb., depending on the type of brush-holders, condition of the track or other service conditions. A careful study will determine the proper

*Ninth and last of a series of articles on commutators for railway motors. The others were published as follows: "Choosing Materials for Railway Motor Commutators," Aug. 21, 1926; "Important Considerations in Replacing Commutator Bars," Oct. 23, 1926; "Accurate Machining of the V's of Assembled Commutators Is Essential," Nov. 20, 1926; "Mica V-Rings and Bushings Have Important Functions in Commutators," Dec. 18, 1926; "Methods and Equipment for Efficient Assembling of Commutators," Jan. 15, 1927; "Soldering of Railway Motor Commutators," Feb. 19, 1927; "Preventing Flashovers Is an Important Part of Commutator Maintenance," March 19, 1927, and "Turning and Slotting Commutators," April 16, 1927.

Digitized by Google

brush pressure. If the roadway is in bad condition, the speed of the car high, or the brushes light it may be necessary to use a brush tension of from 9 to 10 lb. per square inch.

Use of a mechanism where the movement is confined to the spring has eliminated the trouble experienced from sluggish operation. There are no moving parts to wear and cause poor alignment; also the parts to be maintained and replaced are few.

Incorrect brush spacing will cause vicious sparking. On a four-pole motor the brushes should span one-fourth of the commutator bars. Usually on a railway motor the center of the carbon brush box is aligned with the center of the main pole. In repairing carbon boxes or replacement of brush-holders this position should be checked carefully. If there is any doubt as to the correct location of the brushes the motor manufacturer should be consulted.

Worn carbon boxes will allow the brushes to swing off neutral, thus provoking sparking. Worn boxes should be repaired or replaced, as loose carbons will vibrate and chatter. On the other hand, if the carbon is tight in the box its action will be sluggish, so that it will tend to hit only the high spots on the commutator face instead of following any irregularities. When using standard brushes the clearance between the brush and the side of the carbon box should be from 0.002 in. to 0.010 in. for the length and from 0.001 in. to 0.002 in. for the width of the carbon way. These are the manufacturer's allowances for new brush-holders and new brushes.

If commutation is poor it may be improved by using a good brush. Also when the brushes are too long the effective force of the spring is reduced greatly, which also happens when the brushes are worn too short.

A commutator may cause flashing directly or indirectly. A commutator worn to a small diameter will flash at a lower line voltage than a new one. This was demonstrated very clearly in tests by decreasing the diameter of a commutator and lifting the brush to make the motor flash. When the commutator was the original diameter the motor would not flash at a high voltage, such as occurs near a substation, but with the commutator worn to a small diameter it would flash. This test was carried out with the same armature winding and commutator.

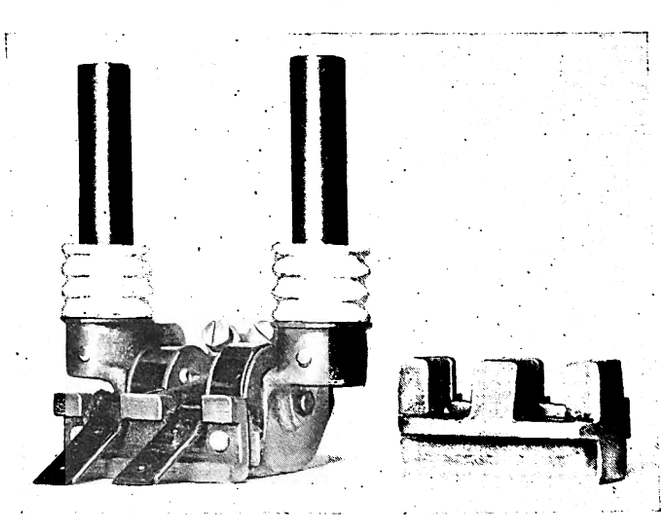
Sharp edges are undesirable on the face of the commutator, as any vaporization will concentrate there. Since the contact area is so small there will be little or no cooling effect on the arc which causes the vaporization. Therefore, all corners of a commutator should be turned to a radius of $\frac{3}{16}$ in. In handling a commutator, burrs at sharp edges should be avoided as they induce shorts between bars.

Sharp edges remaining between bars when the commutator is undercut should be rounded off by drawing a three-cornered file across slots between bars.

Sparking due to vibration of the brushes over rough commutators is inimical to good commutation as well as to the life of the brush-holder. Bars high or low due to looseness should be eliminated by heating the commutator and tightening the commutator nut after subjecting the detachable steel V-ring to a pressure of from 20 to 30 tons. The brush surface should then be given a smooth polish. This has been discussed in the fifth of this series of articles.

Flat spots are another cause of brush vibration. They often are caused by heavy currents flowing through the armature before it starts to rotate. If the flat spots are at the exact spacing of the brushes, one can usually trace the trouble to faulty brake rigging, as when the brakes on one side of the truck do not release until the car starts. Under these conditions the brake rigging should be inspected carefully. Many times flat spots are caused by a heavy starting current due to rapid feeding of the controller or starting before the brakes have had time to release. Flat spots are also caused by poor undercutting of the mica. When the mica is high, the brush will ride on it, burning away the copper. If the mica is high in only a few places the burning will cause flat spots.

Anything which permits the motor to vibrate tends to cause the brushes to jump with resultant flashing. Worn armature bearings are one cause of vibration, especially if the motor is in a car that must operate over a rough track. Flat wheels also cause excessive vibration. These conditions can be altered by better maintenance. If, however, a car must be operated over a rough track



Twin-washer mechanism applied to a new detachable box brush-holder for Westinghouse type 306 motor

and better motor maintenance does not prevent flashing, then the schedule speed should be reduced. It may be necessary only to reduce the speed at points along the route where the motor flashes badly. A careful study may locate these points and the motorman can be instructed to coast across them.

Oil is deadly as it penetrates the bond between the mica splittings in the V-ring and in the strips between the bars. When the commutator heats from flashes and sparking the oil will carbonize. This causes a creepage path from bar to bar or from the commutator bars to ground, which will eventually become a direct short and a hole will be burned in the mica V-ring. A short between bars may be caused by oil in the mica strip. It may produce pitting and burning between bars at the surface of the commutator, or it may not be visible. The latter is more dangerous as the commutator must be dismantled before the short can be discovered and removed.

Flashing from the front of the commutator bars to the front steel V-ring is due largely to the presence of oil, carbon dust and moisture on the mica V-ring. This tends to collect dirt and dust. It forms a creepage path to ground for the vaporized copper to break down the insulation of the air, thus causing a flashover. Obviously to minimize this trouble the mica V-ring should be kept clean and the surface as smooth as possible so the dirt

Digitized by Google

will not adhere to it. Mica V-ring protection was discussed in the seventh article of this series.

Arcing between adjacent commutator bars is an initial cause of vaporization. The phenomena called "ring fire" is known the best. It occurs when a conducting material such as graphite is scraped from the brush by high mica and deposited on the mica or between the bars, causing a short circuit. By carbonizing in the mica, oil in or on the commutator will intensify ring fire, which will continue until the mica is burned from around the piece of carbon. This action is usually called "pitting." The intensity of ring fire is dependent on the maximum voltage between bars and the resistance of the armature coil. It may become so intense that the copper will vaporize, forming minute beads on the ends of the bars or burning cavities in the copper next to the mica. If the voltage between bars is sufficient to maintain the arc a conical shaped cavity will be burned in the copper. These arcs are explosive and resemble small "buck-overs." If the vaporization breaks down the air insulation where the difference of potential is high a general flashover will occur.

Interruption of the power circuit and re-establishing it suddenly unbalances the magnetic circuit, causing spitting at the brushes. If there is any indication of bad commutation prior to this spitting a flashover may occur. Violent spitting may itself cause a flash. Therefore it is necessary to determine the cause of the power circuit interruption. One cause is due to the motorman permitting his car to pass with power on over a section breaker in the contact line. This trouble can be prevented by proper instruction and obedience to rules.

Broken rail bonding which causes a dead section in the return circuit, breaks in the third rail or bouncing of the trolley are three conditions which should be investigated carefully. Wooden guide troughs in tunnels or underground crossings are offenders because the trolley tends to ride the wooden trough so that each time a support is passed an arc is formed. Even though the motor does not flash over there will be spitting at the commutator every time a support is passed.

Rapid feeding tends to make the motor spark and spit. Operating the car down grade at high speed with power on may also cause flashing, especially on rough track. These conditions can be remedied by instructing the motorman properly as to the troubles resulting from careless handling of the car and how he can overcome them.

In discussing this subject R. E. Hellmund in an article in the *Electric Journal* makes the statement:

> The subject of flashing would not be complete without reference to two conditions of operation under which almost any rational motor design is liable to flash. The first is that motors are at times subjected to very high over-voltages; it has been found, for instance, especially in third-rail installations, that when a heavy load is suddenly taken off the line, voltage surges up to two to three times the line voltage may occur. It would hardly be possible to design commercial motors that would stand this under any condition of load without flashing under over-voltage conditions; however, the effect is usually negligible. This is probably due to the fact that high voltage surges are usually of very short duration, so that the flashes caused and maintained thereby do not have time to do much burning; usually the damage due to flashing consists in very slight heating of the commutator bars without affecting the service given by the motors in any way. The damage caused by voltage surges through insulation breakdown may, of course, be quite serious.
>
> Another cause which will make practically every motor flash at times, and which often results in serious damage to the motors, is the practice of throwing the reverse handle of a four-motor equipment car while it is running at a fairly high speed, commonly known as bucking the motors. With the motor connections established under these conditions it is possible for the motors to pick up as generators under practically short-circuit conditions. It seems that the rush of current in his case is so big and the building up of the flux so rapid that the voltages referred to as inductive and self-inductive are very high, and will, together with the effects of field distortion, nearly always cause a severe flashover if the motor is running at fairly high speed. Even if it were commercially possible to design motors that would not flash in this case, it would hardly be worth while doing, because the torque exerted by the motors when they are bucked is so great that it unduly strains the gears, shaft and other mechanical parts. For this reason alone the practice of throwing the reverser handle while running should not be tolerated, except possibly in order to avoid accidents and damages more serious than the burnout or breakdown of a motor.

A weak field due to a short-circuited coil will result in poor commutation because it has a damping effect that tends to oppose a sudden change in the magnetization. A reversed main field coil also reduces the field flux. Field-control motors are sometimes so connected that the additional field winding is in circuit for the running position, overloading that particular motor. A motor operating with a weak field is overloaded, and has a very sensitive neutral commutating zone, so that it will flash more easily than if it were operating with a strong field.

Shop Work Centralized

An addition to the general repair shops of the Washington Railways & Electric Company permitted concentration of repair work at one location

PRIOR to September, 1919, a large portion of the motor, truck and wheel repair work for cars of the Washington Railway & Electric Company, Washington, D. C., was done at eight different carhouses. These are located around the system at widely separated points, as can be seen from the accompanying map. The doing of work at so many locations made it necessary for the daily transportation by motor truck of materials involved in these repairs between the general repair shops and the carhouses. This proved unsatisfactory for several reasons. Armatures and fields were sometimes damaged in transit and in the work of installing, which, together with other repair work, was necessarily done by men who were essentially carhouse workmen and were not trained properly in this class of work. Supervision lacked care, since the carhouse foremen were unable properly to inspect and test these cars after repairs, their time being taken up with other details necessary to proper inspection of car equipment.

The designation of the eight carhouses, together with the number of miles which separated them from the main repair shop and information as to the number of cars maintained at each carhouse, is given in the accompanying table.

CARHOUSES AFFECTED BY CENTRALIZATION PLAN AND MILEAGE FROM THE GENERAL REPAIR SHOP

Name of Carhouse	Distance from General Repair Shops in Miles	Number of Cars Assigned
East Capitol	4	116
Eckington	3	86
Columbia	4	50
4½ Street	3½	50
Eleventh Street	3	43
Brightwood	6	48
Tennallytown	4½	30
Great Falls	1½	25

Tag used for reporting car equipment defects which are to be repaired in the general repair shop

With these facts in mind it was decided early in 1919 to build an addition to the general repair shops at 24th and P Streets so that all repairs to car equipment could be made there. This addition, shown in the accompanying drawing, cost complete $26,000.

The building is of brick with a concrete roof. It is 90 ft. long and 42 ft. 4 in. wide. Each of the three open pits accommodates one car. The floor throughout the building, including the pits, is of concrete except in the section where trucks and motors are overhauled, which has a floor of wood blocks. Each pit is equipped with a Columbia motor-driven car hoist. Two heavy jib cranes, each with a Sprague Electric Company 1½-ton hoist, serve the work floor. These are found ample to care for the three tracks. Particular attention has been given to heating and lighting the building.

Since the shop has been in operation the results have been very gratifying. The only disadvantage of the centralization of work is the extra dead mileage and cost of switching cars between the carhouse and the shops. To offset this, the company was able to dispense with the services of 26 men in the mechanical department as a direct result of the centralization. There has also resulted a large decrease in equipment failures since the new plan went into effect, largely because the men can concentrate on the class of work for which they are particularly qualified. Carhouse forces are now permitted to do only inspection and lubrication and to make slight repairs. As a result inspection work at the carhouses has improved, for the men and foremen can concentrate on it.

The big decrease in yearly maintenance cost with the centralized plan can be seen from the graph. The number of armatures rewound yearly has decreased from 275 in 1919 to an average of but 100 in 1923-26, but of course the reduction actually attributed to the centralized repair work is somewhat less, as other improvements in maintenance methods have also been made.

Before a car is shopped for any reason it is inspected by the foreman of the carhouse where it is assigned. The foreman reports on a tag all defects noted. An accompanying illustration shows this tag, which provides

space for the most important parts of the body, trucks and motors, subdivided into groups for work to be done in the truck shop, carpenter shop, electrical repair department and air equipment department. When filled out by the carhouse foreman the tag is attached to the car.

When the car arrives at the shop each foreman responsible for the repairs listed on the tag makes a note of the work to be done. When repairs are done and final inspection is made he signs his name in the space provided. He also reinspects the car for defects that may have been overlooked by the carhouse foreman, and notifies the office of any defects which he finds.

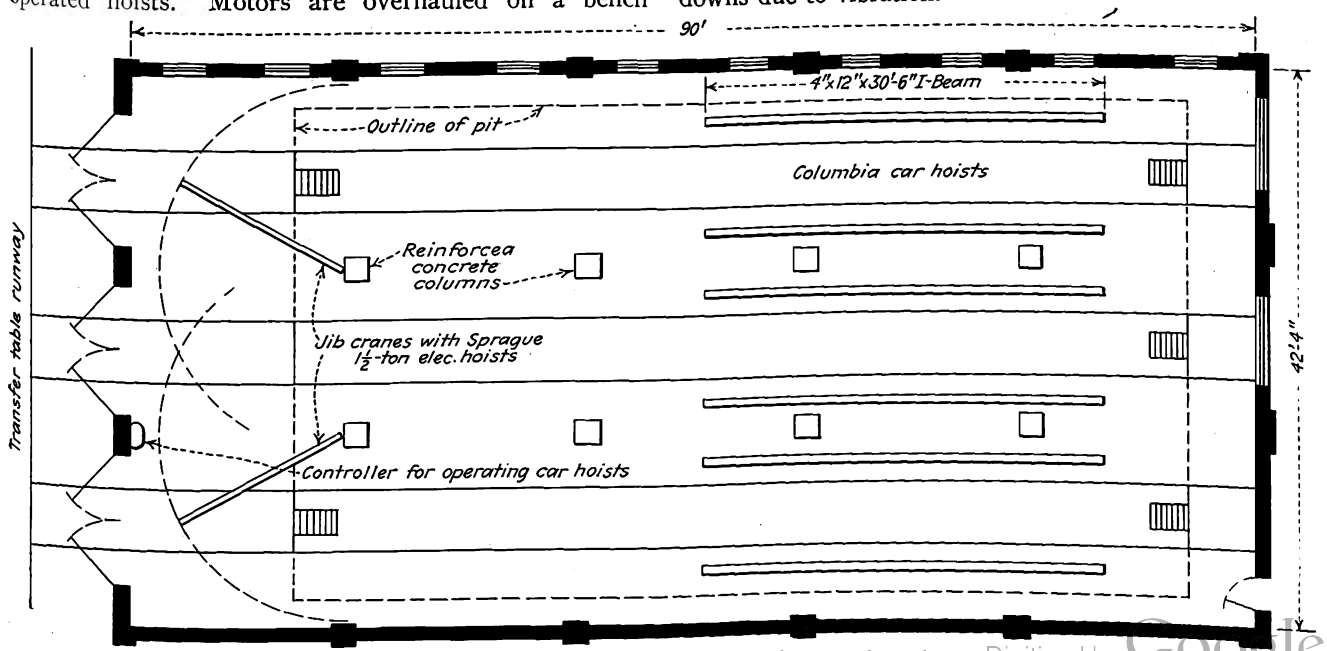
The tag stays in the car until it goes back to the carhouse. The foreman there examines the car thoroughly to see if the defects he reported have all been properly repaired. He then either marks the tag "O.K." on the back or indicates in a space provided any defects remaining. The tag is then sent to the office of the superintendent of equipment. It is filed if O.K., but if any defects have been found in the work they are discussed with the foreman who had charge of that particular job.

Besides the increased facilities provided in the repair shop there is a motor overhauling shop with three tracks, each with a hydraulic car hoist. Over the truck overhauling floor there is an I-beam with carrier and hand-operated hoists. Motors are overhauled on a bench placed in the center of the floor in line with the middle track. This is served by an electric hoist, traveling on an I-beam.

Two-man cars are overhauled on a 65,000-mile car basis and one-man cars are shopped at 55,000-mile intervals. This overhauling basis is varied somewhat by conditions as reported by carhouse foremen.

The car bodies are gone over thoroughly and all electrical apparatus and air brake equipment are cleaned and repaired where necessary. Cables are cleaned, inspected and painted. Trucks are inspected thoroughly for loose and worn parts. Electric arc welding is used wherever practicable to build up worn parts. Axles are removed, tested for flaws and wheels or gears are replaced when necessary. The motors are opened and armatures are rebanded, dipped and baked. New bearings are fitted if necessary. Motor housings, both armature and axle, are washed clean in a hot alkali bath before being sent to the machine shop. Where motor fields are found dried out, damaged or burned they are removed and retaped or repaired.

When the fields are reassembled in the motor frame final tests are applied to the whole equipment. The motor frame is preheated, filled with varnish and allowed to air dry. This keeps out moisture and oil and holds the fields tight in the frame, reducing insulation breakdowns due to vibration.



Additional shop facilities which were provided for motor and truck repair work

Tamping and mopping cold-patch joint to finish paving job. W. N. Hardeman, resident engineer, El Paso, for Stone & Webster, Inc., inspecting the job

Effective Track Repair Methods

in El Paso

Rails were welded to steel ties. Paving was replaced with one course of rich concrete. Joints between concrete and bitulithic pavement were filled with asphalt cold-patch mixture

AN ELECTRIC railway repair job which includes several unusual and interesting methods is now being carried out on about 1 mile of double track along Myrtle Avenue in El Paso, Tex. The 12-in. wood block header courses had disintegrated along both sides of the rails, the gage of the track spread over ½ in. and many joints failed. The primary cause of the trouble was due to loosening of clips and rail fastenings on the steel ties on which the rails were laid.

The steel ties were bedded in a 9½ to 10-in. concrete course which extended to within 2 in. of the top of the 90-lb. A.R.A. rail. The paving course consisted of 2 in. of bitulithic pavement with wood block headers. The web of the rail was protected by a cement mortar filler. Loosening of the clips and tie fastenings had allowed movement of the rail with respect to the tie. This movement caused failures of the wood block header courses and resulted in water getting into the ties and rails. Corrosion then aided the general disintegration.

The paving and concrete courses are now being excavated down to the tops of the ties and the rails are being welded to the ties. Concrete under the failed joints is being excavated and the joints are boosted on white oak blocks, 8x10x24 in. The blocks are ballasted on crushed rock and are fastened to the rail with screw spikes. The flange angles of the old continuous joint straps are sheared off with gas torches and the straps are turned upside down and welded to the rail with electric welders. Compressed air equipment is used for excavating, removing scale from ties and rails and for cleaning joints previous to welding. Cupped joints are built up and are ground to a true surface. The grinding operation consists, first, of the use of small hand grinders, followed with a reciprocating grinder.

In the reconstruction work the spread in the track gage is corrected first by aligning the rail and then welding it in place. One rail is started, after which the lugs and wedges are removed from the ties under the other rail and it is moved to true gage by means of blocking and screw jacks. The rail seams of the second rail are then welded to the ties.

The paving is replaced with one course of rich concrete. A mix of approximately 1 : 1½ : 2½ is used. The joint between the concrete and the bitulithic street pavement is filled and surfaced with a "cut-back asphalt cold-patch" mixture made up by the construction forces.

The entire work is being done without interruption to the movement of electric cars, which at this point have a headway of about four minutes. This feature of the job is a source of satisfaction to the El Paso Electric Company, which operates the line, since the company desires as little interference with service as possible.

Special Overhead Construction Necessitated by New Building

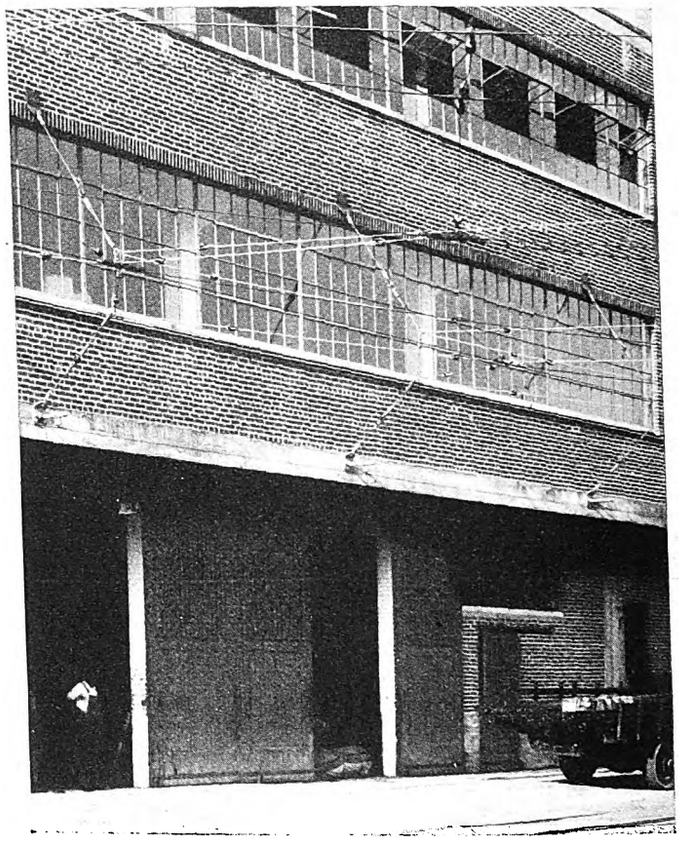
CONSTRUCTION of a storeroom and distribution building for the Memphis Street Railway opposite its carhouse necessitated the removal of the trolley poles and the rearranging of the overhead trolley special work at that point. It was decided to fasten guys from the trolley frogs to the building at a distance of 20 ft. above the ground. To allow for sag between the two buildings, bull-ring guys for supporting the special work were fastened 22 ft. above the ground. This method of construction was complicated somewhat by the new building having a row of windows along the front at the place needed to fasten these guys.

It was decided to use a special arrangement at the building and provide anchors above and below the windows. During the construction of the building 5/8-in. bolts were placed in the wall. At each point where an anchor was to be installed two bolts were installed 6¼ in. apart in the wall. The bolts above and below the windows were in line with each other and were arranged at heights of 16 ft. 4 in. and 29 ft. 2 in. respectively above the ground at each place where a guy was needed. The bolts protruded from the wall a distance of 2 in. and provision was made for the installation of anchors at thirteen places along the wall.

As the windows of the building opened outward in a semi-circle, it was necessary to use a special attachment so as to provide clearance for the windows when opened. The construction as shown in the accompanying illustrations was carried out. Iron plates 5/8 in. x 9 in. x 12 in. were provided for installation as anchors. These were cut and drilled to fit the bolts in the building and then were bent to angles necessary for the construction. Extra high strength 5/16-in. galvanized steel wire was used for the attachment. The anchoring construction was made up on the ground and then was installed on the building. Guys of galvanized steel were installed between the fixtures to secure them in their proper position. After installing the anchor construction, the new trolley special work was built and the old guys and other construction were removed as the job progressed. The amount of special work attachment was reduced to a minimum in order to make it as simple as possible.

The new storeroom has a track running parallel to the side of the building for unloading material. One rail of this track extends under the edge of the building. To support the trolley wire other special construction was necessary, as may be seen from the accompanying illustration. The construction used consists of a piece of iron 9 in. x 5 in. x 3/8 in., to which was welded one end of a 2-in. pipe coupling. A piece of 2-in. galvanized iron pipe 16 in. long with a galvanized iron cap at the extreme end was screwed into this coupling. Ohio Brass Company's type N swivel pole bracket hangers were clamped on the pipe over the center of the track.

To insulate this device from the wall a piece of fiber was placed behind each plate with fiber washers and fiber tubes over the bolts. A round 5/8-in. iron washer was placed between the fiber washer and the nut of the bolt. This made a very rigid and substantial fixture. When the erection of these devices was completed the trolley special work was carried out and was strung with No. 00 phono-electric hard-drawn copper trolley wire.



Type of construction used along new building provides for anchoring overhead special work

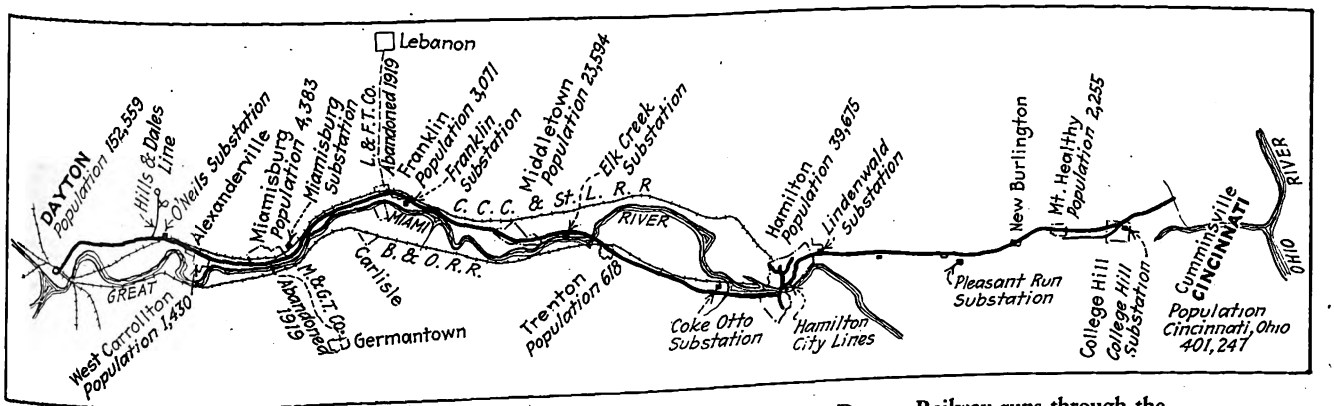
A New Era Dawns for the C., H. & D.

High finance and receivership give way to rehabilitation and progress on the Cincinnati, Hamilton & Dayton Railway. This 53½-mile interurban has expended nearly $1,500,000 on new cars, shops, substations and track improvements

NEWS stories in ELECTRIC RAILWAY JOURNAL of June 25 and July 2, 1927, carried reports of the celebration staged to commemorate the completion of the first stage in the rehabilitation of the Cincinnati, Hamilton & Dayton Railway. This rehabilitation was both physical and financial. It has brought about a complete reversal of the outlook for the property. In the short period of barely more than a year, mere public tolerance has given way to enthusiasm and good will; the employees have caught the spirit of the management, and a property which was headed for the scrap heap holds promise of becoming an invaluable asset to the territory it serves and a source of attractive profit to its investors.

Under the leadership of Dr. Thomas Conway, Jr., J. H. McClure and their associates, the new management of the C., H. & D., which acquired this property on April 27, 1926, through foreclosure, is confident that the disappointing financial results of the operation of the property in the past are in large part—as in the case of many other interurban properties throughout the country—attributable to failure to keep pace with the times. The object of this management's policy is the upbuilding of a revitalized and thoroughly rehabilitated property; first-class track, an economical, modern and reliable power supply, adequate and properly equipped shop facilities, and, above all, cars which will offer a fast, comfortable and attractive ride to passengers. In the short period since April, 1926, there has already been



The 53½-mile interurban line comprising the Cincinnati, Hamilton & Dayton Railway runs through the Miami Valley from Dayton to the outskirts of Cincinnati

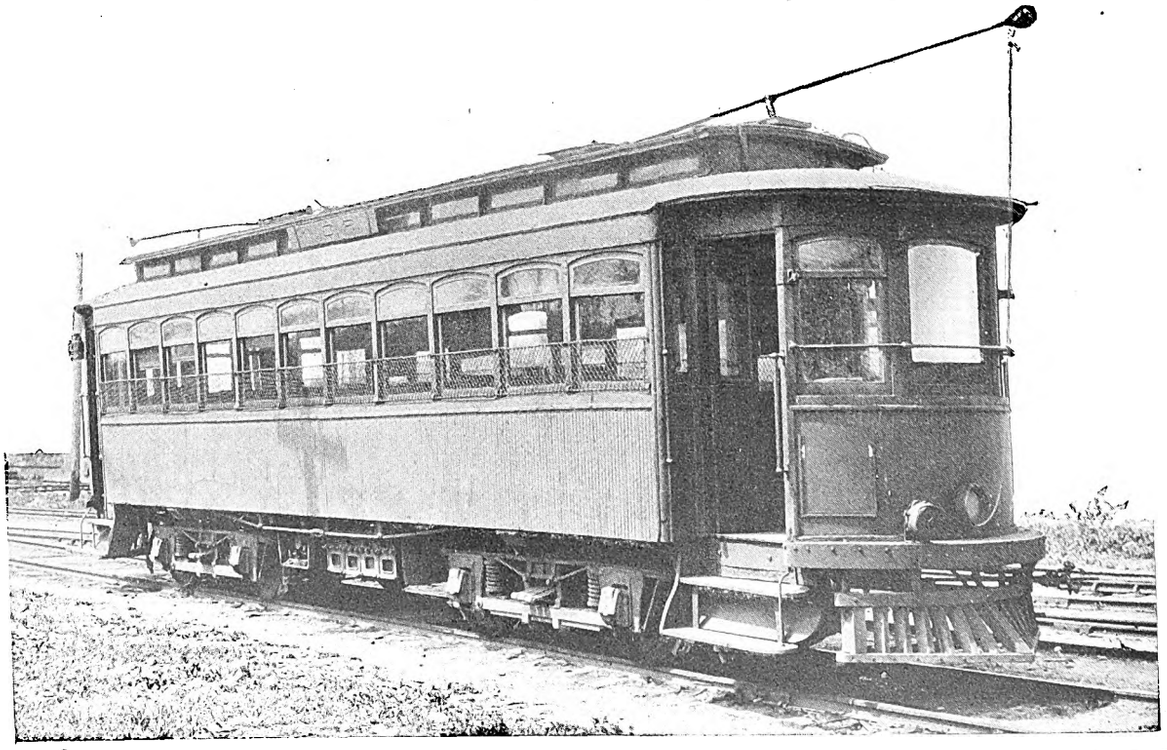
substantial evidence that the road is on the way to becoming a credit and a source of pride to the communities it serves, and a means of recovering some of the losses of its investors. By accepting a radical scaling down of fixed charges through exchanging former bonds for junior securities, thus permitting new money for improvements to be raised and put into the property, old investors have opened the way for the road to be built back and expanded out of earnings so that it promises not only to show attractive returns on new money but to compensate for former losses.

The Cincinnati, Hamilton & Dayton property comprises 53½ miles of interurban line running through the rich Miami Valley from the heart of Dayton, Ohio, south through Miamisburg, Franklin, Middletown, Trenton, Hamilton, Mount Healthy and College Hill to Cumminsville in the outskirts of Cincinnati. Including double track, there is a total of 72.95 miles of interurban trackage. At the Cincinnati end of the line a 5-mile bus extension is operated to the heart of the city. The property also includes 13.8 miles of city track serving the city of Hamilton, Ohio, a community of approximately 50,000 population.

Rehabilitation Program Extensive

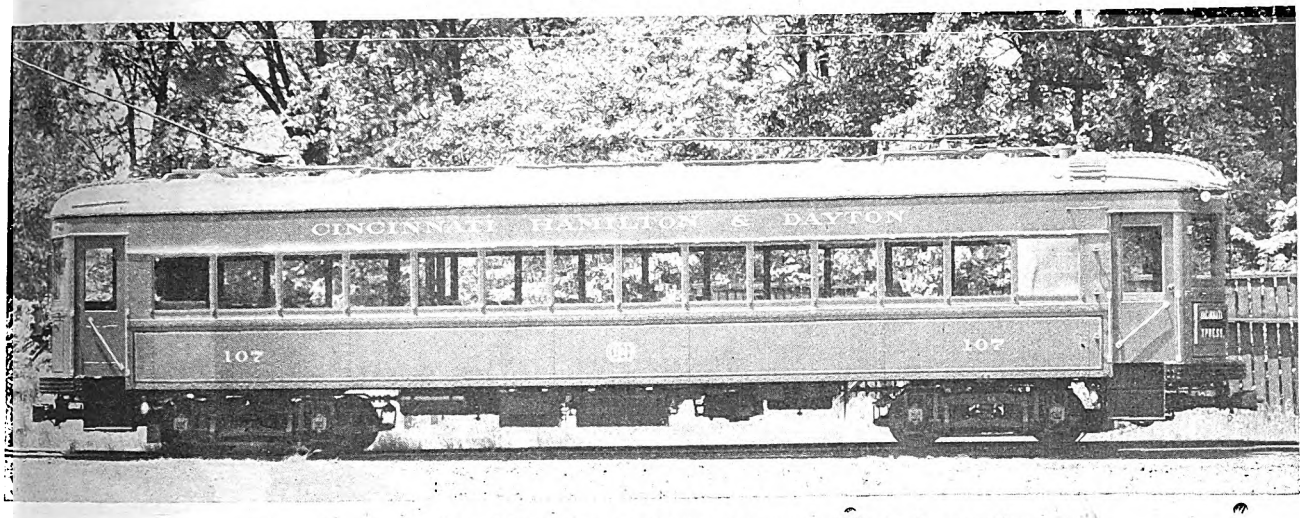
Almost a million and a half dollars has already been expended on the rehabilitation of the property. Additional improvements aggregating $180,000 are authorized for this summer. Ten new high-speed de luxe interurban cars were purchased to replace the present equipment used in through service between Cincinnati and Dayton. Ten new double-truck de luxe one-man, two-man cars were purchased to replace old equipment in use at the Dayton end of the line. Six new single-truck one-man cars were purchased for service in the city of Hamilton, and sixteen of the 22 existing Birney safety cars were completely rehabilitated for that service. Equipment purchased included also 40 C.E.R.A. standard freight box cars and a new 50-ton freight motor car to be used as a locomotive.

The company's old power house will be shut down, contracts having been made for purchased power at an attrac-



These cars, formerly used in Dayton city service, formed the funeral pyre which marked the coming of a new era in the C., H. & D.

Digitized by Google



One of three double-end interurban passenger cars arranged for train operation

tive rate, and eight new full automatic substations were substituted for six old manually operated 25-cycle stations formerly in use. Nearly a mile of new high-tension line was constructed; direct-current feeders were overhauled and necessary switching facilities installed to insure adequate protection in the event of line failure or other emergency. In addition, trolley wire replacements were made where needed and the line department provided with utility equipment required to insure adequate inspection, maintenance and freedom from interruptions to service and to cut line maintenance costs to the minimum.

A large modern concrete and steel shop building, together with necessary machinery and labor-saving hoists and cranes, was purchased. Land was obtained with this plant to provide a storage yard for approximately 75 cars, conveniently arranged for movement in and out of the shop and to the main-line tracks. The former inadequate and inconvenient shop was shut down and sold.

Track Improved and Freight Facilities Added

During the receivership extensive tie replacements had been made, so that this part of the roadbed was in fair shape. There has followed a determined program of weed extermination, track alignment and reballasting. Paved track on Pleasant Avenue in Hamilton has been completely rebuilt at a cost of more than $105,000. New wyes have been installed, bonds replaced where necessary, new electric switches put in to cut down delay while operating through city streets, and the telephone system has been rehabilitated. Service equipment and machinery needed by the track department have been purchased.

In addition to the new freight equipment, terminal facilities have been provided to enable this class of business to be handled efficiently. A new double-track connection with loading facilities within the building was constructed into the enormous new Delco-Frigidaire plant of the General Motors Company at Moraine, Ohio, at a cost of more than $37,000. A new fabricated steel freight house, together with necessary trackage, was built in Cumminsville, the Cincinnati terminal, and further additions at this point are contemplated.

All of the above work has been practically completed. Additional track improvements to be made this summer include reconstruction work in Dayton, south of Miamisburg, between College Hill and Mount Healthy and in Hamilton. These involve an expenditure of some $137,000. Construction of new sidings, extensions to freight stations and trackage, rehabilitation of passenger waiting rooms and the installation of block signals will bring this sum to more than $180,000.

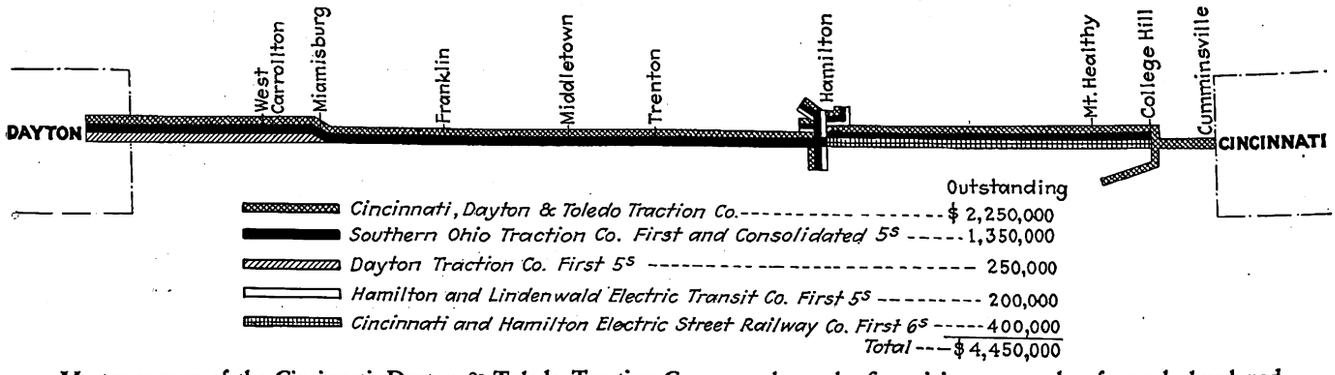
Ten of these de luxe city cars built by the Cincinnati Car Company replace the former dilapidated equipment which is illustrated elsewhere

Like many other interurbans of this type, the present property was built piecemeal. In 1894 the first section was constructed from Dayton to Miamisburg and was called the Dayton Traction Company. The section from Miamisburg to Hamilton, built in 1896, was known as the Cincinnati & Miami Valley Traction Company. Two years later, in 1898, the Cincinnati & Hamilton Electric Street Railway built that part of the line which connects Hamilton to College Hill in the outskirts of Cincinnati. In 1900 all three of these properties were consolidated into the Southern Ohio Traction Company, which also absorbed the Hamilton & Lindenwald Electric Transit Company, comprising the local street railway lines serving the city of Hamilton. In 1902 the Cincinnati & Northwestern Railroad, approximately 6 miles of steam railroad running from Cumminsville north to Mount Healthy, was consolidated with the Southern Ohio Traction Company to form the Cincinnati, Dayton & Toledo Traction Company. Then in 1905 the entire property was leased to the Cincinnati Northern Traction Company. This company operated the property for two years, built the Lindenwald power plant, high-tension line, substations and 27 miles of new track on private right-of-way to replace other track originally constructed on the highway. The new power system replaced the separate d.c. power plants that had been formerly operated and that had been built by the various original operating companies. In 1907 the Cincinnati Northern Traction Company assigned its lease to the Ohio Electric Railway, and the property was operated by that company until 1918. In 1916, default of interest on bonds of the Cincinnati, Dayton & Toledo Traction Company led to the appointment of a receiver, but the Ohio Electric Railway was permitted to continue operation until two years later.

The property was reorganized in 1918, following a foreclosure sale which wiped out $2,250,000 of Cincinnati, Dayton & Toledo Traction Company bonds, and became the Cincinnati & Dayton Traction Company. This company then issued bonds on segregated portions of the property. A question of priority in interest payments on these latter securities, raised by the holders of the general underlying bonds, and default having occurred in the payment of principal and interest upon certain underlying bonds, litigation was begun which resulted in a receiver being appointed in 1920. Both the litigation and the receivership continued until 1926. At their termination the property was sold to the reorganization managers representing the Southern Ohio Traction and the Cincinnati & Hamilton Electric Street Railway bonds, which organized the present Cincinnati, Hamilton & Dayton Railway.

Financial Structure Simplified

Two small underlying mortgages are retained. The Dayton Traction Company first 5's, shown on the accompanying chart, were extended as 6's to 1931. The Hamilton & Lindenwald first 5's on the Hamilton city lines were refinanced as 6's to 1931. The total of these two issues amounts to $450,000. The new company created an open-end mortgage over the entire property and issued $850,000 in bonds, which were purchased for cash by the holders of the old Southern Ohio Traction Company bonds, the Cincinnati & Hamilton Electric Street Railway bonds, and a syndicate organized by the new management. There were then issued 60,000 shares



Mortgage map of the Cincinnati, Dayton & Toledo Traction Company shows the financial structure that formerly burdened the property. There is now outstanding a total of only $1,300,000 of bonded indebtedness

Digitized by Google

of no par value common stock to represent the balance of the equity in the property, the minimum value of which was fixed by an engineering appraisal at $4,675,890. All of the common stock is held by a holding company known as the Cincinnati, Hamilton & Dayton Corporation. This financial structure is expected to permit earnings to be plowed back into improved and extended facilities, so that the road may keep pace with the needs of its territory and may continue the program of modernization so auspiciously started. Part of the cost of new equipment was financed by an issue of $450,000 of car trust certificates.

Planning Has Been Done for the Future as Well as the Present

It has been the general object of the new management to develop and execute an over-all plan for the rehabilitation of the property that should bring the maximum results for the territory served and for the investors, utilizing existing financial resources so as to bring about the greatest possible immediate improvement, but at the same time fitting each step into an over-all program. This was particularly important in the selection of the interurban passenger cars, in providing new shop and yard facilities, in expenditures for the development of freight business and in planning improvements to power facilities and right-of-way.

There are roughly 600,000 people at the Cincinnati end of the line, and a large amount of freight moves between Cincinnati, Dayton and points north thereof. In addition, the entire Miami Valley is a heavily settled district with many important industries scattered throughout its length. Further improvements in the line, relocations to give a better right-of-way so as to make fast transportation of freight and passengers possible, development of passenger business at the Cincinnati end of the line and of through passenger travel from Dayton to Cincinnati following completion of the subway under construction by the city of Cincinnati, all constitute future possibilities that are taken into consideration in the present program. The Miami Valley is believed by the management to be destined to become a very much more heavily settled industrial district. The new Delco-Frigidaire plant alone has led to the development of a 2,000-acre tract for residential puposes in its immediate vicinity. At Middletown the American Rolling Mills Company has recently acquired the Coke Otto by-products plant as part of a program to extend its operations in the valley. There is believed to be a strong prospect that the entire valley will develop into a continuous string of industrial and residential communities.

The general features of the rehabilitation program and the design of new equipment will be published in subsequent articles.

Chicago "L" Employees Have Long Service Records

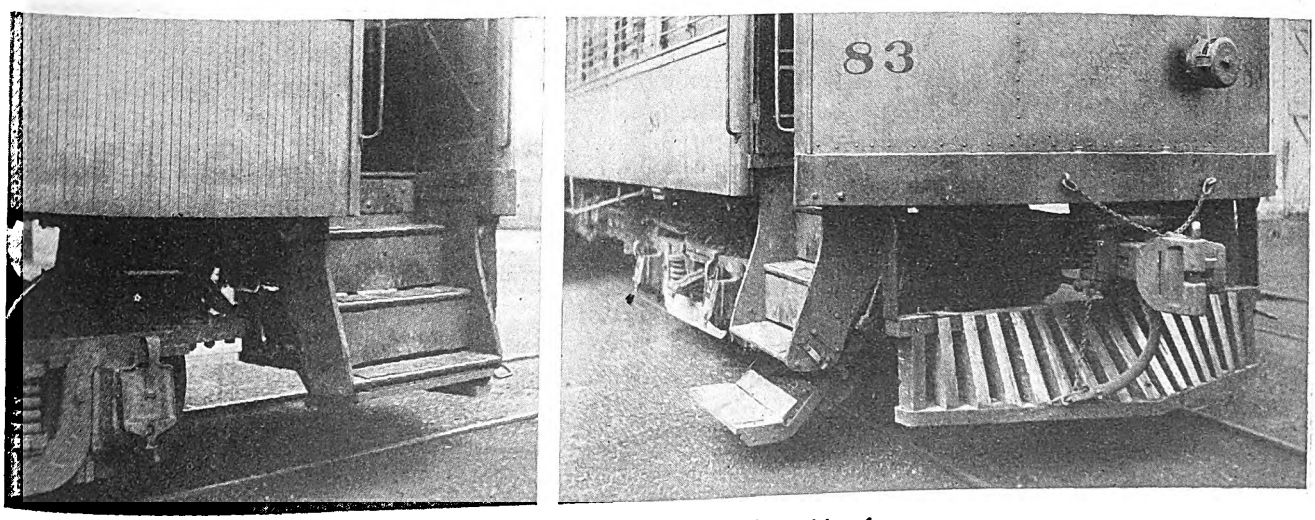
CHICAGO RAPID TRANSIT employees cannot have extremely long service records, as the first line, the South Side Elevated, was only partially opened for traffic in 1892. Still there are 114 employees with from 30 to 35 years service, including many who started with the company in its first few months.

The Lake Street Metropolitan and North Side divisions opened in the years between 1893 and 1900. The survey showed 221 employees with between 25 and 30 years of service to their credit and 363 employees who have been with the company and its predecessor companies between 20 and 25 years. A significant point shown by the survey is that only 915 employees have been with the company less than one year, while 1,571 are in the one to five years class and 1,543 in the five to ten years class. In the ten to fifteen years class there are 684 employees and in the class from fifteen to twenty years there are 616 employees.

Folding Extension Steps for Interurban Cars

SOME time ago the Southern Ohio Public Service Company, Zanesville, Ohio, decided to discontinue the use of old style Pullman stools for unloading and loading passengers and to provide an extension step to the permanent step construction of its cars. The accompanying illustration shows the step construction, which has proved entirely satisfactory, and since its installation there have been no accidents to passengers when boarding and alighting from trains.

The step consists of a tread and toeboard mounted on strap-iron hangers. These hangers extend upward at an angle to an operating shaft which is attached to the step skirting. The shaft is rotated by means of a handle installed alongside the permanent step construction. The step is lowered by raising this handle and when pulled down the step pulls into its running position.



At left, step in folded position; at right, step in position for passengers

The Prize Winner for June Is

CHARLIE HERMS

Commutator bar spacing attachment for slotting machine gets $25 monthly prize for June in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest. Robert Harris receives honorable mention for method of setting car window glass in rubber tubing

Charlie Herms

THE winner of the June prize, Charlie Herms, went to the San Diego Electric Railway in 1923 as shop foreman and early the following year was promoted to general shop and carhouse foreman, his present position. He began his electric railway experience in 1919 with the San Antonio Public Service Company in Texas as general repair man. He continued in this capacity for four years, when he was promoted to foreman over a crew engaged in remodeling cars.

Mr. Herms has always been particularly interested in mechanical construction and during the war was attached to the first army headquarters in a motor repair unit. Other experience outside of the electric railway field included supervision of the mill department of the San Antonio Portland Cement Company and a position with the Boston & Superior mine in Arizona to recondition the electric and telephone system of that company.

"COMMUTATOR Bar Spacing Attachment for Slotting Machines," an article submitted in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest by Charlie Herms, general foreman of the San Diego Electric Railway, San Diego, Cal., was given the $25 monthly award by the judges. It was further agreed that honorable mention should go to Robert Harris, master mechanic of the New Brunswick Power Company, St. John, N. B., for his description of the method used by that railway in setting car glass in rubber tubing.

Competition for the June prize was close. Twelve articles were published in the Maintenance Data Sheet section of ELECTRIC RAILWAY JOURNAL for June 18. All these were considered as very high class by the judges. The spacing attachment for a commutator slotting machine showed special thought on the part of the developer to devise a successful machine which would accomplish the work in a partially automatic manner, thus relieving the operator from the care and thought that must be given to manual spacing of commutator bars. The device is ingenious and will prove of great benefit in the slotting of commutators which is now universal practice on all electric railways. By use of such an attachment the slots will be lined up accurately so that a wider saw can be used without danger of cutting away the copper bars and so that less mica which requires removal before the armature is to be placed in service will be left along the edges of the slots. The time for slotting with such an attachment should be reduced materially.

Breakage of glass is one of the annoying occurrences on electric railway cars. Glass set in rubber tubing as described in the article by Robert Harris should prevent the tendency to loosen and rattle, eliminate some noise and decrease materially the breakage. On a number of properties the replacement glass costs a considerable sum in a year. A large saving should result from the use of rubber tubing.

The Maintenance Data Sheet section in this issue includes another group of articles submitted in ELECTRIC RAILWAY JOURNAL'S competition. The amount of material which has been received is now far above what can be published in one issue so that many interesting descriptions of methods and devices are being held for publication in future issues. The articles published this week will be judged for the monthly prize of $25 for July. These should serve as a guide to contributors as the kind of material that is being submitted. Full information regarding the rules of the contest was given in the April 16, 1927, issue of ELECTRIC RAILWAY JOURNAL, pages 700-701, and condensed rules and instructions for the contest have been published each week since then. Contestants should read the rules carefully in order that they may comply with all conditions.

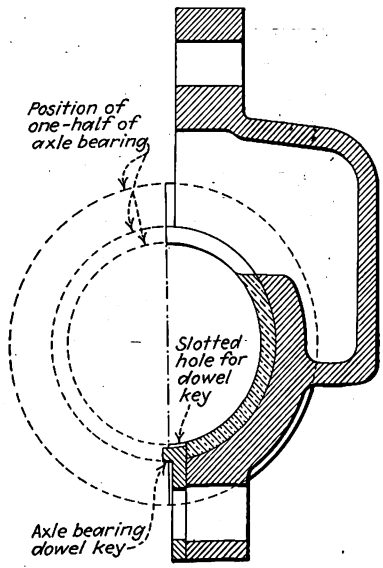
Axle Bearing Dowel Prevents End Motion*

By J. A. Duffy
Superintendent of Equipment Monongahela West Penn Public Service Company, Fairmont, W. Va.

THE ordinary dowel pin used with axle bearings allows them to slap against the end of the motor axle housing if the axle collar is loose. This results in unnecessary wear of the inside of the axle collar and causes short life to the axle bearings.

To overcome this condition a special type of axle bearing dowel is used with equipment on our property. The accompanying illustration shows the assembly with an axle bearing. The dowel is fastened to the axle cap and projects through a slot into the bearing so that it not only holds the axle bearing in place but it keeps it from turning around and also from working inward.



Special dowel key for axle bearing

TRACK AND WAY DEPARTMENT—5

Keeping Paving in Good Condition with Little Money*

By Louis T. Botto
Superintendent Maintenance of Way San Antonio Public Service Company, San Antonio, Tex.

MORE than 300,000 sq.yd. of pavement in the track area must be kept in good condition by the maintenance of way department of the San Antonio Public Service Company. Although paved track mileage has been added each year and the old pavement has become harder to keep in repair, still the amount spent for paving maintenance has been less each year since 1924. This saving has been brought about by extensive use of Uvalde rock asphalt, Mexican oil of 12 gravity and limestone screenings.

Wood block paving and long stretches of brick and concrete pavement have been reclaimed simply by the application of the Mexican oil, dusted off with a thin covering of finely ground rock asphalt, sufficient to fill the depressions in the street. In regular paving maintenance work slight depressions in the track area are cleaned, oiled and dusted off. Deeper depressions along the rails, or holes in the track area, are cleaned thoroughly, oiled, filled with limestone screenings, oiled again, and then the surface is covered with the asphalt, leaving the surface slightly higher than the street grade to allow for settling.

West Commerce Street, San Antonio, Tex., as it appeared in June, 1927. Pavement was treated with Mexican oil and rock asphalt in 1914

Rock asphalt has proved of particular benefit as a paving material when laid properly. It is ground finely and can be applied successfully to any hard, unyielding paving surface, such as wood blocks, brick, concrete or asphalt. It can be used in any thickness desired, even as small as ¼ in.

Exhaust Tunnel for Carrying Off Dust from Armatures and Motors*

By C. W. Wood

Master Mechanic Virginia Public Service Company, Hampton, Va.

DUST is being cleared from armatures and motors in the shop of the Virginia Public Service Company by the exhaust tunnel shown in the accompanying illustration. This is a portable box made on a frame of ⅞-in. x 2-in. wood strips covered with beaver board. The sides and rear end are fitted with dowel pins. The top has holes corresponding to the dowel pins in the sides and end.

The rear end has a square hole 12 in. x 12 in. about the middle which fits over the neck of the intake side of an exhaust fan of the Buffalo Forge exhaust blower type. Armatures are blown out with an air hose connected to the shop air supply and all dust is carried up the shop flue by the exhaust.

TRACK AND WAY DEPARTMENT—6

Anti-Creeping Anchors for Double-Track Crossings*

By L. C. Mayer

Chief Engineer York Railways, York, Pa.

ELECTRIC railway crossings at double-track steam railroads are affected materially by the creeping of the railroad tracks in the direction of traffic. As a result, after a few months, a track crossing assumes an appearance of a letter "S." It then has to be opened up, new rails cut into the railroad tracks on both sides of the electric railway crossing, parts realigned and pavement replaced. If this is not done at frequent intervals the arms of the crossing in the electric railway tracks are liable to be broken by the stress.

To overcome such troubles the York Railways constructed a horizontal truss, which, when attached to the webs of the railroad rails, anchor one track to the other. The truss is constructed of structural shapes, the tension members resisting the creepage of the railroad tracks and the compression members preventing the railroad tracks from converging under stress. The accompanying illustration shows the construction. One of these trusses was placed in the tracks of the Pennsylvania Railroad between Harrisburg and Baltimore, where railroad traffic is quite heavy. After three years' service the electric railway crossing shows no signs of being pushed out of alignment.

LINE DEPARTMENT—1

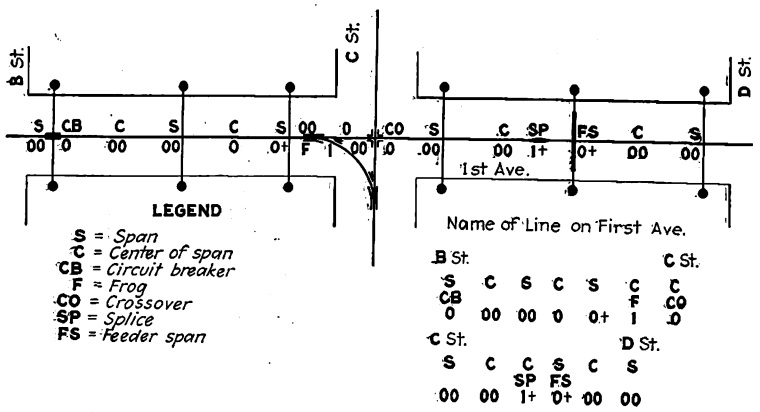
Convenient Method for Gaging Trolley Wire*

By M. M. Watkins
General Foreman Railroad Distribution
New Orleans Public Service, Inc., New Orleans, La.

Gaging and inspection of trolley wire is done by an effective method developed by the New Orleans Public Service, Inc. The entire system, comprising 220 miles of trolley, is gaged once each six months by two men who use a light tower truck. It takes about three weeks to cover this mileage, at an average cost of $1.48 per mile.

For convenience in locating points to be gaged a key diagram is used, as shown in the accompanying illustration. The wire is measured with an ordinary B. & S. gage at the points indicated. The size of the wire is noted in an ordinary record book. In addition to making the notation of the size all fittings, such as splicers, frogs, section insulators and cross-overs, are inspected and a record is made if they are in bad condition.

An examination of the gage book is made daily and all bad wire and fittings are listed. Orders are then given to the line crews to renew or change these as rapidly as possible. This method has proved very effective and economical and has kept trolley wire breaks due to worn wire and fittings at a minimum on lines of this property.



Location of gage readings taken on trolley wire and method of recording

ROLLING STOCK—TRUCKS—11

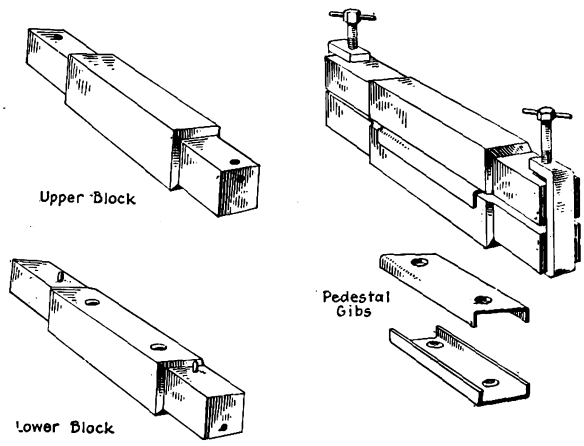
Form for Shaping Pedestal Gibs*

By A. C. Lasher
Macon Railway & Light Company, Macon, Ga.

Pedestal gibs for certain types of trucks are made easily with the assistance of a form as shown in the accompanying sketch. The device used in the shop of the Macon Railway & Light Company consists of two cast-iron blocks, each about 22 in. long by 4 in. thick, the width of which is equal to the distance between the flanges of the gibs to be made. The lower block is drilled and countersunk on its face, the holes being spaced to correspond to the spacing of the holes in the truck pedestal for which the gibs are desired.

Material for the gibs is sheared from $\frac{3}{16}$-in. or $\frac{1}{8}$-in. boiler plate. The holes are drilled or punched to proper dimensions. When drilled the holes should be slightly smaller than the desired size as they are enlarged somewhat in the process of forming.

Next the plate is heated, after which it is laid on the block and the countersunk-head pins or punches are driven into the holes in the plate and into the block. The upper block is then clamped down, with the pins still in place to act as dowels to hold the plate in alignment. The flanges are then hammered down roughly, after which the form is turned first on one side and then on the other and the flanging process is completed with a flatter and maul.



Form used for pedestal gibs in the shop of the Macon Railway & Light Company

A small dowel pin at each end in the face of one block, engaging corresponding holes in the other block, serves to hold these parts in position while the clamps are being adjusted. For lifting the upper block on and off a $\frac{5}{16}$-in. hole is drilled 1 in. deep in each end of the block. Two handles of $\frac{1}{2}$-in. iron rod about 6 in. long and covered with asbestos are used as lifters.

The form may be made to accommodate two different widths of gibs or hole arrangements. The form then can be turned over to reverse the position of the two blocks when making the second type.

LINE DEPARTMENT—2

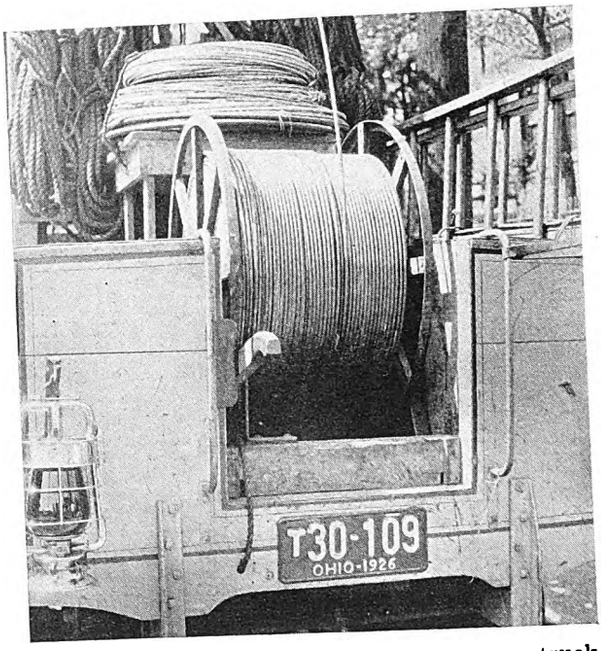
Trolley Reel for Emergency Trucks*

By Angus G. Scott
Assistant Superintendent of Overhead Lines Cleveland Railway, Cleveland, Ohio

STRINGING of trolley wire in a few sections is facilitated by a small reel capable of holding 1,400 ft. As used by the Cleveland Railway, this is mounted on the rear of one of the line trucks and serves as an excellent means for carrying trolley wire.

As shown in the accompanying illustration, the reel has a diameter of 24 in. and a width of 16 in. Each side has a steel band 1 in. wide with sprockets attached. The reel is mounted on an insulated steel arbor, so as to give clearance for loading, and an adjustable brake is installed so as to bear against the steel band.

In stringing trolley wire the lower table is reversed and the trolley wire is carried up, the splicer is attached and the truck is then backed up to the point where stringing is to begin. The brake is adjusted so as to give the necessary tension to keep the trolley wire up to a safe height while stringing. In an emergency all of these operations may be performed easily by one man.



Trolley wire reel mounted on an emergency truck as used by the Cleveland Railway

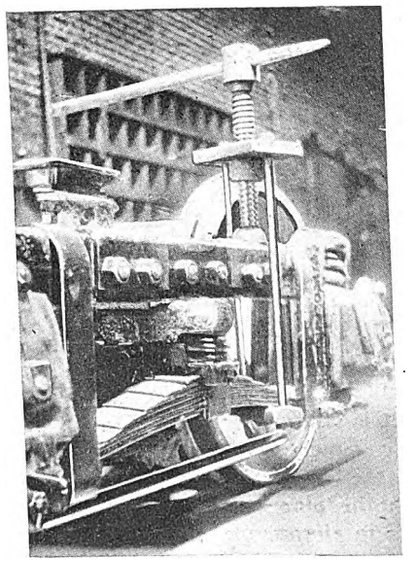
Device for Installing Semi-Elliptic Bolster Springs*

By E. C. Kelly
Shop Foreman Virginia Public Service Company, Hampton, Va.

CONSIDERABLE difficulty was experienced in replacing semi-elliptic bolster springs in some types of trucks operated by the Virginia Public Service Company until the device shown in the accompanying illustration was designed. It consists of a screw jack 2 in. x 14 in., with the usual type of swivel end to prevent creeping and reduce wear on the end of the screw. The head has two ⅞-in. holes in which to insert the handle. The cross head consists of a nut to which is welded a 1-in. x 6-in. x 10-in. bar with suitable holes drilled, to which bolts or chains may be attached, to go underneath the bolster spring and lift it into the desired position.



Installing a semi-elliptic spring with jack screw in the shop of the Virginia Public Service Company

The use of this jack has reduced the labor cost of installing springs 50 per cent and has eliminated practically all of the accident hazard incident thereto, when a makeshift attachment was used. Many other jobs that cannot be handled on shop presses can be taken care of readily with this device.

5 out of 7

Regularly use "TOOL STEEL" Gears and Pinions

In the Electric Railway Journal, Maintenance Competition, May 21, 1927, seven articles were submitted from men in Philadelphia, Chattanooga, Atlanta, Washington, New Orleans, Birmingham, and Portland, Maine. Presumably these companies are alert in an effort to keep down maintenance costs.

5 out of 7 of these companies regularly use "Tool Steel" gears and pinions,

and

3 of the 7 companies, when buying new equipment, have specified "Tool Steel" gears and pinions on their new motors.

also

In the April contest (April 16th issue of Electric Railway Journal) 5 out of 6 were submitted by "Tool Steel" gear and pinion regular users.

"Tool Steel" gears and pinions reduce maintenance costs; if you take almost any classification of the "Live Wires" in the industry you will find that the great majority keep down their maintenance costs with "Tool Steel" gearing.

The Tool Steel Gear & Pinion Co.
CINCINNATI, OHIO

BUSES AND TRUCKS—3

Portable Dustpan Keeps Bus Yard Clean*

By C. B. Lindsey
Superintendent of Automotive Equipment
Los Angeles Railway, Los Angeles, Cal.

BEFORE the portable dustpan shown in the accompanying illustration was constructed by the engineering department of the Los Angeles Railway the sweeping up of the bus yard was a large job. The company operates more than a hundred buses and the sweepings from these littered the yard, particularly during windy weather.

The receptacle is made so that it can be pushed under the step of the lowest bus which the company operates, and a surprisingly large amount of paper and other refuse can be swept into it. This speeds up the work of cleaning the bus and also keeps the yard in clean condition.

Sweepings from buses go directly into a portable dustpan in the yard of the Los Angeles Railway

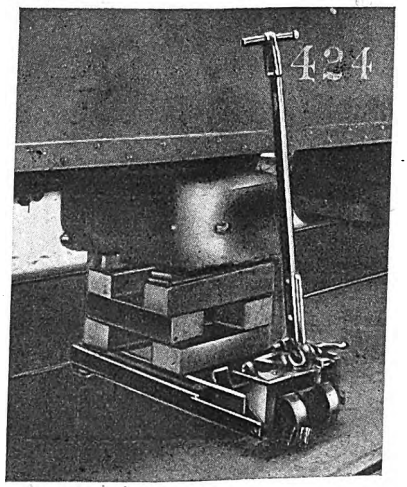
Lift Trucks Used to Change Air Compressors*

By Equipment Department
Georgia Power Company, Atlanta, Ga.

STEUBING lift trucks are used by the mechanical department of the Georgia Power Company for changing air compressors. There are a total of five, one at each of three carhouses and two at the main shop. One truck at the main shop is also used for transporting motors.

Due to the lifting and sharp turning features, this type of truck is particularly applicable for changing air compressors. The accompanying illustration shows an air compressor on blocking just as it has been lowered from the car body. The blocking between the truck and the compressor is required, due to different levels at which the bottom of the compressors come. The older type compressors, which are National A-4, have a clearance of 7 in. above the rail, whereas the modern compressors on cars with 33-in. wheels have 20 in. clearance.



Compressor being lowered from car body after it has been disconnected from hangers

The truck is equipped with 7-in. wheels and has Timken roller bearings, so that it is shifted easily with heavy loads. The use of this type of truck for changing air compressors has enabled work to be done quicker and with less effort than previous methods. It has a decided advantage over the old hand method of blocking up and shifting compressors on skids.

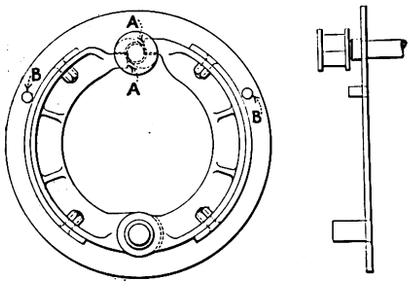
BUSES AND TRUCKS—4

Bus Brake Shoe Calibrating Gage*

By Charlie Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

On the buses operated by the San Diego Electric Railway it was found that in the life of a brake shoe the contact surface at the cam end wears unevenly. When a new shoe is put on the side where the contact is worn the least does all of the braking until the shoe is worn down enough to equalize with the other shoe on the same drum. This uneven condition of brakes caused considerable trouble, particularly in brakes seizing and sliding tires.

To overcome this difficulty the mechanical department of the railway devised a gage as shown in the accompanying sketch. This is similar to the actual drum mechanism, but is so made that all movable parts are in plain view of the inspector. A standard cam is used and the shoe to be tested is mounted on the pivot pin and dropped in place between the dowels, designated as *B-B* on the sketch, so as to engage the cam. To test a shoe the cam is set in release position by hand and the shoes are pushed in. The cam is then turned slowly by hand, as in setting up the brakes, until one of the shoes makes contact with a dowel, indicated as *B* on the sketch. If the opposite shoe does not touch, then the shoe contact *A* is built up by electric welding until both shoes are expanded uniformly. Since this method has been adopted most of our bad order brake troubles have been overcome and much of our tire trouble has been eliminated by having less sliding.



Brakeshoe calibrating gage used by the San Diego Electric Railway

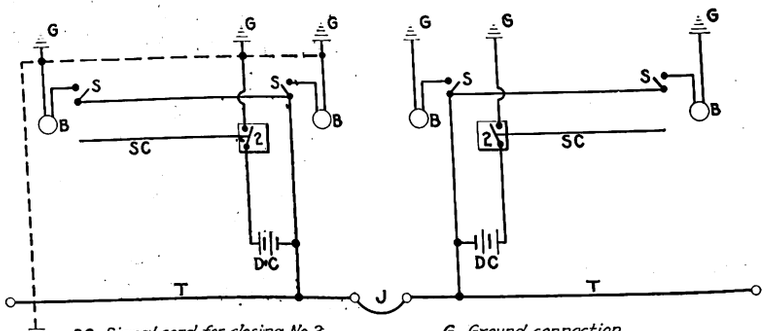
ROLLING STOCK—MISCELLANEOUS—4

Intercommunicating Signal System for Two or More Cars*

By H. A. Albin
Superintendent Lancaster, Ephrata & Lebanon Street Railway, Lebanon, Pa.

The accompanying diagram shows an intercommunicating car signal system which is used for train operation by the Lancaster, Ephrata & Lebanon Street Railway. A buzzer or bell is installed on each end of the car and is designated by the letter *B* on the accompanying diagram. A single-pole knife switch at each end of the car closes the circuit for the particular signal bell or buzzer which it is desired to use. The positive side of a dry battery is connected to the single-pole switch and the negative side to a make-and-break switch which is operated by a bell cord. The closing of this signal switch grounds one side of the circuit and gives the signal.

All cars of the Lancaster, Ephrata & Lebanon Street Railway system are wired to use this method of signaling. The train line receptacle of the cars had one line which was not used in the control of the train and this was utilized for the "T" line through the jumper between cars. Where cars are not wired for multiple-unit control this "T" wire must be installed in each car and a jumper connection provided between the cars.



SC. Signal cord for closing No.2

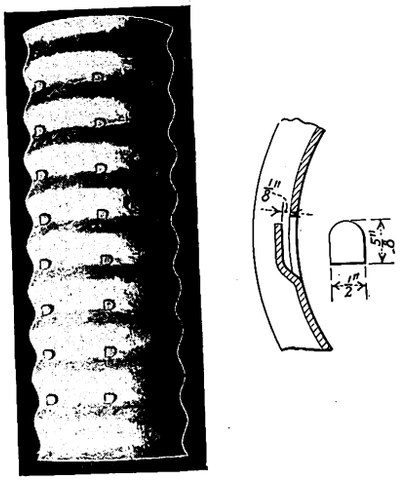
New Equipment Available

Improved Type of Perforated Drain

PERFORATED drainage structures as manufactured by the Canton Culvert & Silo Company, Canton, Ohio, have been improved so as to overcome roadbed troubles resulting from improper drainage.

The new type B drain illustrated consists of a galvanized pipe punched in the upper two-thirds of its circumference with rows of holes, each protected by an outward-pressed tongue which is raised about ⅛ in. from the body of the pipe. This construction retards the entry of silt or dirt into the pipe, and excess water is carried off quickly.



The pipe is punched in the upper two-thirds of its circumference with rows of holes protected by a Tongue

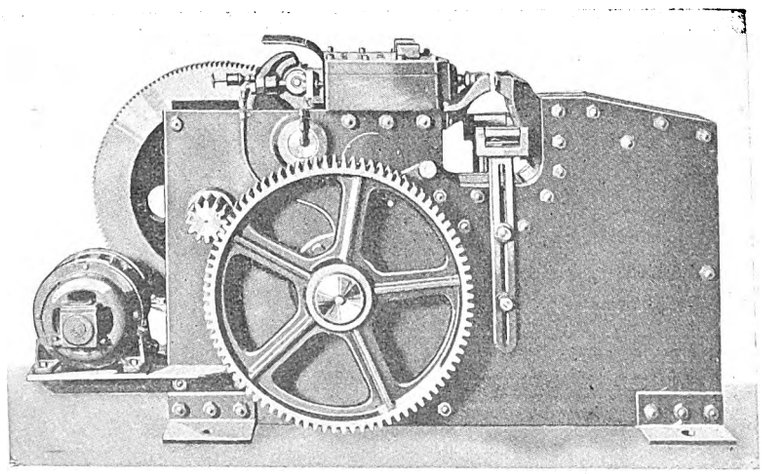
The base metal is No. 16 gage or heavier Toncan copper molybdenum iron, which is a comparatively recent metallurgical improvement in the field of rust-resisting iron. Tees, ells and curved sections to any radius can be supplied. Advantages claimed for this type of construction are extreme durability, unbreakable construction, increased strength and ease of handling and installation.

One good general overhaul will save many a dead car haul.

Horizontal Punch Handles Special Shapes

FOR convenience in punching flanged pieces, curved angles, beams, channels and other special shapes which cannot be handled to advantage in a vertical machine, the Buffalo Forge Company, Buffalo, N. Y., is adding a new horizontal punch to its line. All gears, flywheel, etc., are below the top of the machine so as not to interfere with the handling of specially shaped and bent sections. Architectural jaws allow punching close to the corners of angles, I-beams and channels and in the webs and flanges of H-sections. The semi-floating punch head permits lowering the punch for the accurate locating of centers. The punch is engaged by a foot trip.

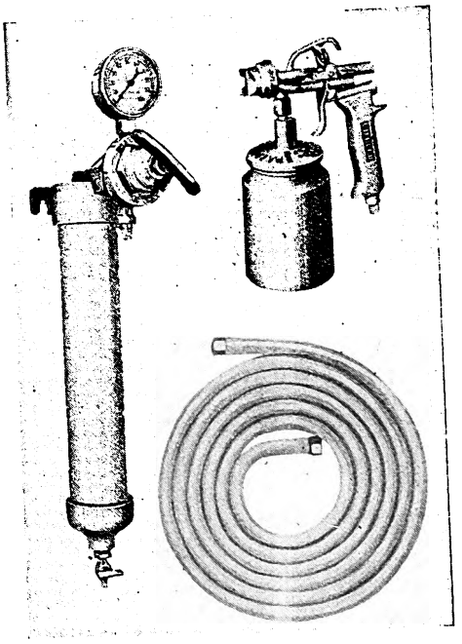
A cast-steel rocker arm on a bronze-bushed kingpin which is stationary in the frame operates the punch. The frame is reinforced at this point by welded disks. Wear of the ram is taken up by bronze-bushed eyebolts. Gibs on the plunger make it adjustable for wear. The frame is made of two heavy armor steel plates. The machine is built in four sizes, with capacities of 3, 5, 7½ and 10 hp.



New horizontal punch for use with special shapes

Siphon-Feed Paint Spray Unit

SIPHON feed adaptable to a wide range of painting is used in a spray unit placed on the market by the Alexander Milburn Company, Baltimore, Md. The outfit with type E gun can be used for either paint or lacquer finish. The gun can be adjusted for the fine work of touching up and also can be used for spraying large surfaces. An ordinary compressor is sufficient to supply the volume of air needed.



New paint spray unit

The atomization of the new spray outfit is very fine, which minimizes sanding and rubbing operations. It is surrounded by an air pocket, which lessens the loss of material, so that the entire spray can be utilized for covering surfaces thoroughly. The equipment includes an air purifier which is of scientific construction for delivering pure air only to the gun. It is of assistance in obtaining good finishing results. The air upon entering the purifier passes through a series of double baffles, which extract the moisture and other impurities.

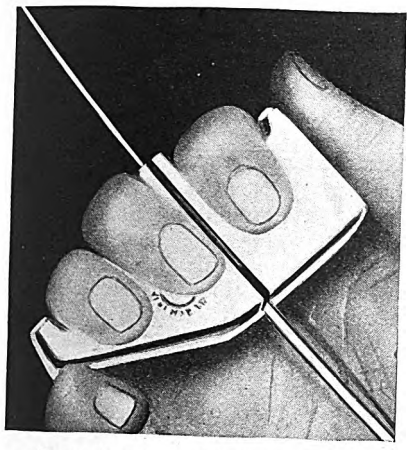
The complete unit includes a type E gun with quart container, air conditioner, air regulator and 25 ft. of air hose with necessary connections.

Fish-Tape Puller

A SIMPLE, husky come-along for fish tape has been placed on the market by Mathias Klein & Sons, Chicago, Ill. It does not injure the tape and can be carried in the pocket.

To attach the puller to the fish tape the tape is placed sideways in the slot

Digitized by Google



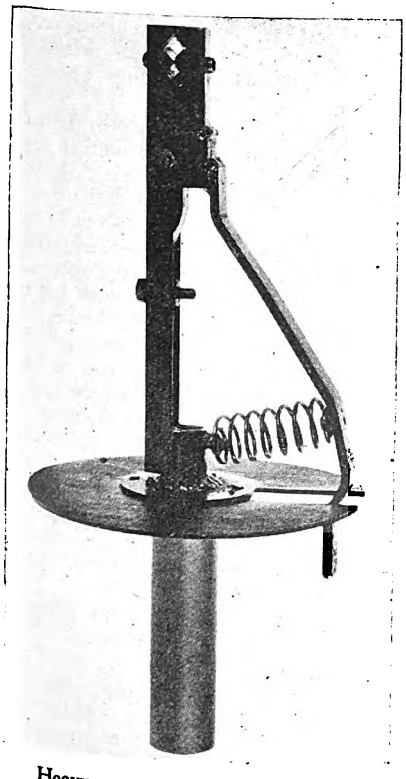
Convenient type of fish-tape puller

and a slight forward motion is given to the puller while pushing the tape deeper. This slips the tape under the ratchet wheel and by pulling a positive grip is obtained. The puller can be slid forward to any desired position for a new bite.

Heavy Current Electrode Holder

WITH the coming of heavy current arc welding, new accessories have been necessary. The accompanying illustration shows a 600-amp. metal electrode holder just brought out by the Lincoln Electric Company, Cleveland, Ohio. This holder handles metal electrode in sizes up to ½ in. diameter and is known as type TR.

Many improvements are claimed for the holder, among them being replaceable copper jaws, four line contact for the electrode, all copper path for welding current, structural steel construction, light weight with good balance, cool insulated and ventilated handle and shield for protection of the operator's hand. High-current, high-speed manual welding requires holders and accessory equipment with the maximum comfort.



Heavy current electrode holder

Steel-Panel-Mounted Supervisory Control

CONSTRUCTION of a new type for supervisory control equipment has been designed by the Westinghouse Electric & Manufacturing Company. The relays and circuits that have been used successfully in the past are included in the new equipment, but the method of mounting is entirely new. This supervisory control equipment is similar in appearance to other switchboard panels in the dispatcher's office and in the substation. The panels are of formed "stretcher-level" sheet steel construction, 16 in. wide by 90 in. high. The supervisory relays are mounted in metal cases similar to the way power relays have been mounted for years, a number of relays being mounted in a single case.

A set of synchronous visual supervisory control equipment for the control and supervision of twenty oil circuit breakers will have two steel panels at both the dispatching point and the substation. At the dispatching point one panel will have twenty escutcheon plates and any receiving meters, such as milliammeters or synchronoscopes, that may be required for remote metering or synchronizing. The escutcheon plates are equipped with a control key, red and green indicating lamps and pilot lamps. The other panel will have three supervisory relay cases mounted on it. One case will contain the master equipment and the two others will house the individual point equipment for the twenty points, ten points per case. At the substation one panel has three supervisory relay cases mounted on it. This panel is an exact duplicate of the one described above for the dispatching point. Four type MS interposing relays are mounted on the other substation panel. A type R remote metering transmitter may also be mounted on this panel.

This type of construction is not only similar in appearance to other switchboard panels, but it permits a more convenient layout in both the dispatcher's office and the substation, and in addition requires much less space.

System a Prerequisite of Successful Bus Operation*

By Clark T. McConnell
President Cleveland-Ashtabula-Conneaut Bus Company

DESPITE the almost unprecedented popularity with which the motor bus has been favored I believe that most operators and the people generally interested in motor bus development are overoptimistic concerning future expansion. It is my firm belief that unless two things happen in the next year or two we can expect to find a decrease in motor bus popularity. These are, first, improvement in motor bus chassis and bodies, and, second, an increased efficiency in operation through systematic methods employed by the operators.

It is my belief that the manufacturers of bus chassis and bodies have been unnecessarily slow and dilatory in the improvement of their product. Up to the present time few manufacturers, if any, have considered the operator's viewpoint and problems and worked on their product accordingly. The manufacturer has not constructed equipment which could be operated and maintained at the lowest costs commensurate with the nature of the operation.

If the motor bus is to continue as a popular mode of transportation its operation must be made profitable. There have been too many failures in the motor bus business due to the ignorance of the operator who thought he was making money just because he was in a cash business and his daily receipts exceeded his daily expenditures. At the end of the first, second and third years, when the operator found that he had failed to set aside sufficient money to renew his equipment or replace it, he had to raise additional capital to pay for something that rightfully should have been charged to operating expense.

The manufacturer must of necessity build a chassis and body that under average conditions can be operated some four to five years before replacement is required. Such a body and chassis must not only be constructed rigidly but in such accessible form as to allow replacement and repair at a minimum effort and cost. I wish to prophesy that the manufacturer who, in the next three to five years, does not appreciate the operator's problems in the construction of his equipment will have no sale for his product.

Just as the manufacturer has been slow and negligent in improving equipment, so has the average operator in many cases been fatally negligent in systematizing his operation. This can be easily explained when we consider the many instances where motor bus operations were started by individuals with one or two operating units. Most of these operators had neither business nor transportation experience and training. They could without trouble take in their daily cash while driving the bus in the daytime, bank the money and pay their bills, and at night make their own adjustments and minor repairs. But as they grew and required additional equipment, they neither made preparation for operation on a large scale nor provision for proper maintenance of their equipment. As a result many a good operation has either been lost or is struggling with broken-down equipment and a decreasing patronage.

While the methods developed by our organization may not be new, they are the result of intensive study and have enabled us to effect considerable economies. We have divided our business into three separate and distinct headings:

1. Maintenance of Equipment.
2. Operation of Equipment.
3. Clerical and Office Management.

A definite system for maintenance of equipment is important not only for the purpose of keeping the equipment in good mechanical condition and thereby preventing breakdowns, but also for the purpose of keeping the maximum amount of equipment available for use during the peak-load hours of the day. There is too much money tied up in capital investment, interest thereon, insurance and general overhead which goes to waste when buses are laid up in the shop during hours when they could be in profitable use on the highway.

We have four garages located approximately 30 miles apart. In each of these shops we maintain a night force of mechanics. They do the major portion of the adjusting and mechanical work necessary to put the equipment in shape for operation the following morning. We also maintain a day force in the main garage at Cleveland to take care of daytime adjustments, breakdowns and heavy work.

In order that all cars have proper care, a chart system is absolutely necessary, either on a mileage basis or on a time basis. By this I mean the chart can indicate when certain things must be taken care of by the number of miles run, or by the number of days when the cars are used in regular daily operation. We are using the time basis.

In working on this basis we have a perpetual chart which is not changed from day to day and which can be used like a calendar. These charts should be made out for every part that requires attention, principally the following: Chassis greasing, differential greasing, driveshaft lubrication, motor oiling, magneto and generator oiling, shock absorber lubrication and steering gear oiling. Charts should also be made out for valve grinding, clutch adjustment, relining of brakes and inspection thereof, inspection of differential, transmission, driveshaft, steering gear, wheel bearings, generator and magneto.

Great saving can be made by daily inspection and proper inflation of tires. The same is true of batteries. Inspection of vacuum tank and carburetor is essential. We find it takes about 30 days for these parts to become dangerously saturated with dirt. A chart should be kept for piston and piston rings and the draining of the tanks on air brakes.

It is easy to secure forms for this chart system, but it is useless to have the forms without setting up the organization and having the management determined upon accurate compliance therewith. There are certain vital parts of the car that should be inspected daily or at the end of each run regardless of charts. These are the steering assembly, driveshaft and brake mechanism, bracket and lights.

Care should be taken in selecting labor-saving tools and equipment. There are many pieces of equipment which will pay for themselves in a short length of time in reduced labor cost the nature of which is peculiar to different operations, but the following are a few that have proved profitable to our operation: Chain hoist, small power drill, welding

outfit, machine for cutting out connecting rod bearings to proper size, power emery wheel, electrical test bench, power washer, a battery charging outfit, hand presses, power Alemite grease gun, wheel pullers, electric soldering irons, wheel aligner and pneumatic air pump.

All drivers should be required to turn in a work card at night, after turning in their buses, stating whether the car is O.K. or not, and in the case of work to be done, they should state, in their own terms, just what they have found out of order. The foreman of the garage then takes this card and sets forth in mechanical terms the work to be done by the mechanics. All work cards should be registered and a register book is kept to see that none is lost. In the old way, we had numerous cards torn up by the mechanics, so that the blame could not be placed if the work was not done. The permanent record remedied this.

The importance of constant maintenance of bodies cannot be overestimated. There are many small rattles and defects which in the first instance may be minor in their nature, but which if permitted to pass without attention will require expensive repairs. It is also essential from the viewpoint of your patrons that the bodies be kept in first-class condition. To the average bus rider defects through neglect of the body are more apparent than defects in the chassis. There is nothing more annoying to a patron than a rattling window or door. The bodies should be renovated at least once a day as well as fumigated. We employ a body man at each of our main garages. These body men probably save us more money than any other laborers we employ. Body work which when done by outside companies has cost us as high as $500 is being done in our shops for frm $50 to $100. The body men are also able to eliminate all rattles and replace broken panels and fenders without keeping the equipment off the road at the peak hours.

We maintain our own paint shop. A bus is taken in every Monday morning, the body completely repaired and a thorough coat of paint is given it, including redecorating of the interior. While the painting is being done curtains are dry cleaned and, where necessary, new parts are installed. These cars are painted with a paint gun with quick-drying paint, which enables us to have the equipment back on the road the following Saturday to handle the week-end rush. We find that newly painted buses, aside from attracting business and arousing favorable comment, have the psychological effect of making the driver more careful in his handling of the equipment. We have also found it advantageous to change the color scheme occasionally. It causes comment and attracts business.

The first and most essential part of a motor bus operation is the operator. He must not only be a good driver but must be a salesman, he must be honest and courteous. It is necessary, therefore, to establish a system of investigation by way of application for position. The next step is the training of the applicant. The applicant is first tested as to his ability to drive, then put on with one of the older drivers, where he is trained as to the operation of the bus, names of the towns and the fare zones. He then drives a bus under the supervision of an experienced operator for three days, at the end of which time a report is turned in as to the applicant's qualifications.

The human element in the operation of a bus line is not to be disregarded. We make every effort to keep our employees in a satisfied and contented frame of mind. Following a principle that the success or failure of an operation depends primarily on the driver and that cheap or underpaid labor is expensive economy we have worked out a scale of wages which we believe is as fair and reasonable as could be expected. Our drivers are paid on the basis of 3½ cents per bus-mile for the first two years; after that they are increased to 4 cents per bus-mile and are given runs that will average them close to $200 per month. We give our employees a week's vacation with pay and a cash present for Christmas. We also carry life insurance for our men free of cost in amounts ranging from $500 to $2,000, depending on the length of time they have been with the company.

The third division of operation has been referred to as the office or clerical department. The methods employed by our company are complete in every detail. We are in a position to know at the end of each month from our statements the amount of revenue and expenses of operating each divison of our line. We know the amount of revenue on every run. We are thereby kept constantly in touch with the weak runs and are able to revise our schedules to meet the requirements and to eliminate loss. We are able to tell the cost of upkeep of each piece of equipment and know each month our weaknesses and our strength.

We have found it rather expensive to install our present methods and systems; in fact, more expensive than we had anticipated. However, we have been able to cut down and consolidate certain features of overhead and believe today that the methods used are as efficient as we can make them and as economical.

Although I am a strong advocate for modern and improved methods of organization and believe that they should be applied to the motor bus industry, caution should be taken by the small operators in systematizing their business. There are many "cure-all" accountants and systematizers who should be avoided and changes should be made slowly and carefully. System is vital to successful operation, but too much system is worse than none at all. Sound principles and business methods intelligently applied are the secret of a successful operation.

Railway Management Best Qualified to Find Place of Bus*

By B. W. Arnold
Manager Motor Coach Department,
Chicago, North Shore & Milwaukee Railroad

SOME 30 or 40 years ago when the linotype machine was developed, adding a new tool to the printing industry, the publishers and printers who had previously been setting type by hand hailed the new invention as a useful tool in their trade. They installed the machines in their printshops, operated them by skilled printers and continued in the business which they had learned from the ground up. The result was a tremendous increase in the volume of printing produced and consequent benefit to the public.

The situation in the transportation industry is much the same as it was in the printing industry a generation or more ago. The motor coach has been developed and is a new and useful tool in the hands of skilled operators who have made transportation their life work. In the hands of inexperienced and irresponsible individuals it may easily become the reverse of useful, a disturbing and destructive factor in the industry, which in the long run can only be harmful to bus manufacturers.

There can no longer be doubt in the mind of anyone that the motor coach has a place, and an important one, in our scheme of transportation. We may disagree in details as to its proper place, but in the end I believe it will be found that the experienced electric railway operators are the men best fitted to put the motor bus in the place where it can be used to the greatest advantage in the service of the public.

The transportation field is a broad one. It embraces many problems, each of which may call for different treatment. The problems are so diversified that what is applicable in one situation may be utterly impracticable in another, although the two situations are seemingly alike. Transportation methods which are reasonably satisfactory, let us say in London, might not be workable in New York or in Chicago. The transportation problems of a nation are so vast and so complex that with all the available agents now at our command the public demand for transportation service never has been met fully in any country.

This public demand is growing year by year and will continue to grow indefinitely. As transportation companies engaged in serving the public, our business is to find ways of more nearly filling that demand, rather than indulge in foolish controversies over substituting motor coaches for electric railways or motor trucks for freight cars running on rails, steam and electric.

The real problem confronting the transportation companies is one of ad-

Abstract of address presented at convention of Motor Bus Division, American Automobile Association, Philadelphia, Pa., June 15-17, 1927.

Digitized by Google

justment, not of substitution. We cannot at this time afford to discard any of the tools of our trade, but we can and should find the best and most economical use to which we can put them, always keeping in mind the trust imposed upon us of giving the public the service it requires.

I am a firm believer in the motor coach. Its flexibility gives it a decided advantage over the car operated on rails under certain conditions. The latest types of motor coaches have seating capacity almost equal to that of the cars used on surface, elevated and subway lines in our large cities. They are lighter in weight than the smallest of our one-man cars of the Birney type. For certain classes of service they are better adapted than the electric car.

Fully recognizing the many advantages of the motor coach, I am firmly convinced that it has its very definite limitations. It certainly cannot now, and I doubt whether it ever can, take the place of the electric railway.

I am not sure that our experience with the motor coach as a substitute for the electric railway is extensive enough to be absolutely conclusive, in view of the constant changes being made in motor coach construction. The experience in Akron, Ohio; Des Moines, Iowa, and Bridgeport, Conn., where the motor bus was given full opportunity to prove its ability to take the place of the trolley car, was anything but satisfactory to the public. Its failure in those medium-sized cities, with the full support of the city administration in each instance and the sympathy of the people at first, does not inspire confidence in its performance in a great city where the rush-hour problem is much more serious.

Careful studies and traffic checks made by competent engineers in a number of large cities during the hour of maximum travel place the capacity of rapid transit lines operating trains of cars over a single track at from 35,000 to 50,000 passengers an hour. The capacity of surface lines operating cars in single units is from 14,000 to 16,000 passengers per hour and of motor coaches of the double-deck type about 6,000 passengers.

The greatest need of the large city today is for rapid transit. As population grows and spreads farther out from congested areas, the need of rapid transit facilities increases. Few will contend that this need can be supplied by the motor coach operating on the surface and sharing the roadway with other forms of vehicular traffic.

A concrete illustration of the difference in speed made by an elevated rapid transit line and a motor coach is seen in Chicago, where the two forms of transportation parallel each other. From the city limits on the north to the Loop under the most favorable conditions the schedule of the rapid transit line is 30 minutes, while that of the motor coach is 68 minutes.

In Indiana experience showed that the motor coach cannot take the place of the interurban railroad for long-haul traffic. It required considerable time, and cost the electric railroads and the motor coach companies a lot of money to find it out. The result of the experiment was a receivership for the motor coach company. In a public statement issued at the time by the receiver for the motor coach company he said: "It is becoming apparent that the operation of motor buses should be co-ordinated with existent steam and electric forms of transportation. The buses find it impossible to stand alone, but are logically indispensable in rounding out a complete, unified transportation system."

From my experience in the operation of electric railways and of motor coaches I have reached certain conclusions which may be summarized as follows:

In mass transportation the motor coach is not a substitute for the electric railway.

It is not adapted for rapid transit service, which is the greatest need of the hour in all our large cities.

In interurban service the motor bus is less efficient than the electric railroad in long distance travel. Its operation in competition with an electric railway capable of adequately supplying the needs of a territory is economically unsound and not in the interest of the public.

Operated in conjunction with the electric railway the motor coach is not only useful but indispensable as a part of any properly co-ordinated transportation system.

In many classes of transportation service the motor coach is better adapted to meet the public requirements than is the electric railway.

Electric railway managers, experienced in the business of transportation, are the men best qualified to find the proper place for the motor coach and utilize it to the best advantage. Instead of assuming an indifferent if not a hostile attitude toward the motor coach, the electric railway companies should welcome it as a valuable aid in helping to solve many of the problems confronting them. Its usefulness has been fully demonstrated, and if its proper place in our scheme of transportation has not been found the fault lies largely with the electric railway companies that have failed to appreciate the value of this new tool of their trade.

American Association News

Coffin Contest Date Extended to Aug. 1

ON JAN. 17, 1927, the Charles A. Coffin Prize Committee of the American Electric Railway Association issued an invitation to all electric railways to enter the 1927 contest. At that time the committee set the final date for the receipt of presentations on July 15. In a letter dated March 26, announcing the publication of the digest of the 1926 presentations, "Making Transportation Pay," it was erroneously stated that the 1927 presentations would be received up to Aug. 1.

This has led to some confusion and the committee, therefore, has decided that in fairness to all concerned the final date of receipt of presentations for the 1927 award shall be extended to Aug. 1. A notice to that effect has been sent to all companies that have indicated their intention to enter this year's contest.

Special Bulletins

FOLLOWING is a list of special reports being prepared by the Bureau of Information and Service of the American Electric Railway Association. They will be available to member companies upon request:

Bulletin No. 148: ACCIDENT STATISTICS OF ELECTRIC RAILWAYS, 1926. A comparative summary and analysis of accident statistics reported by 195 electric railways, for the years 1926 and 1925. Some of the items covered are as follows: Total number of accidents, number of accidents involving motor vehicles, number of car collisions, number of persons injured, number of fatalities, total cost of claims, ratio of total cost to gross earnings, expenses of claims department, number of car-miles run and number of passengers carried per accident, details of claims department expenses, etc.

Bulletin No. 149: ACCIDENT STATISTICS OF MOTOR BUS LINES OPERATED BY ELECTRIC RAILWAYS, 1926. This is the first comprehensive summary of motor bus accident statistics that has been compiled. The bulletin includes the reports of 68 bus companies operated or controlled by electric railways and gives substantially the same information for motor bus operations as is given for electric railway operations in Bulletin No. 148.

Bulletin No. 150: COMPARISON OF ELECTRIC RAILWAY OPERATING CONDITIONS, OPERATING EXPENSES AND RESULTS OF OPERATION ON VARIOUS UNIT BASES—Part 2, INTERURBAN LINES. A tabulation of data for interurban lines similar to that given last month in Bulletin No. 145 for city lines. The data include the average speed, number of revenue passengers per car-mile, per mile of track, per car operated, operating revenue, operating income and net income per mile of track, the cost of maintaining plant and equipment per car-mile and per unit of property maintained, and operating costs on various unit bases of comparison.

Bulletin No. 151: TREND OF MATERIAL PRICES. A new edition of the association's regular bulletin on relative costs of materials, bringing down to date the trend of prices of materials used by electric railways based on data contributed by the manufacturers of such material.

In addition to the above the following supplements have been prepared, bringing the information to date:

Supplement No. 22 to City and Interurban Fare Bulletins Nos. 41 and 42.

Supplement No. 4 to Bulletin No. 129: Wages of Trainmen.

Supplement No. 4 to Bulletin No. 130: Wages of Bus Men.

Cost of Living Studies (Bulletin No. 152).

News of the Industry

Six-Day Week in Boston

Slight increase in hourly pay, but reduction in weekly wage results—Explanation by management

A SIX-DAY week has been established by the Boston Elevated Railway, Boston, Mass., for all its employees. A new wage agreement for 1927 has just been adopted which carries this provision. Its 4,000 blue uniform men, motormen and conductors, have been working seven days a week, and the rate of wages under the 1926 agreement was 72½ cents an hour. This rate is raised to 75 cents an hour under the new agreement, making $36 a week, or about $5 a week less than the men earned when working seven days a week. Operators of one-man cars and of buses will receive 85 cents an hour, maintaining their differential. Other provisions in the agreement are the same as in 1926.

The new agreement was reached by direct negotiations between the Board of Public Trustees and a committee from the union, without referring anything to arbitration. It has been ratified by the men. One of the immediate results will be the re-employment of a number of men who had been laid off.

For three years the rate of pay was 72½ cents an hour, in 1923 it was 70 cents, in 1922 it was 63 cents.

A statement issued by the management of the elevated said:

> This is made possible by the men who have been working regularly seven days a week accepting a substantial reduction in weekly pay, which is offset in part by an increase of 2½ cents an hour in the hourly rate of the classes affected, making the basic rate for motormen and conductors 75 cents an hour.
>
> Many of the classes of elevated employees already had a six-day week and their rates and conditions remain unchanged.
>
> This is the final step in applying the fundamental principle which underlies the state law that requires one day off in seven for employees engaged in transportation, except when they request otherwise.
>
> The abolition of the seven-day week has been the subject of discussion since 1919 and the question of its abolition or modification has been considered in several arbitrations. In 1920 the neutral arbitrator in his award expressed the opinion that no set of men should be obliged to work more than six days consecutively except in case of emergency. He said: "Neither the employing company nor the public is entitled to such service as an established proposition and schemes should be evolved in the future to eliminate it."
>
> It seemed to the Board of Public Trustees that the soundness of this view could not well be questioned and for some time it has felt that a situation under which some men worked practically 365 days in a year called for a change. The willingness of the men this year to co-operate has made it possible to bring conditions in harmony with the purpose of the statute and the practice generally prevalent in other industries.
>
> Inasmuch as the general manager felt reasonably confident that the cost of service for the ensuing year under the proposed agreement would be met by the estimated receipts it seemed to be the proper time for making this highly desirable change in working conditions.

Training Course at Cleveland

The committee on education of the American Electric Railway Association has issued an informative pamphlet on the training course for foreman conference leaders to be conducted from Oct. 3 to 8 inclusive at Cleveland, Ohio, during the convention of the American Electric Railway Association. The sessions will occupy one-half of each day or six half-day periods in all. Railways interested in the movement are invited to send representatives to Cleveland. The pamphlet contains comments of participants in the 1926 conferences.

The training course is under the auspices of the committee on education and directly under two of its members, H. H. Norris of the Boston Elevated and A. J. Sarré of the New Orleans Public Service. Frank Cushman of the Federal Board for Vocational Training will also assist in the work.

Treat the Matter Intelligently!

THE public should bear in mind that transportation is one of the necessities of life; that difficulties beset any transportation agency in a rapidly growing community, and, more particularly, where a new transportation agency, such as automobiles, develops. Such a new agency as this may exclude former methods of transportation; it may compete with them, or it may supplement them, the last result being the most desirable one. The whole subject should be treated with intelligence, with fairness and with patience, and it should be remembered constantly that no utility can perform its function in a community unless it has revenues sufficient to provide for extensions, for depreciation and for a reasonable return upon the capital invested. At the same time, the public has a right to demand a sincere, intelligent, active policy on the part of the managers of utilities to deliver proper service to the community.
—Louisville Courier Journal.

New Base for Negotiations

United Railways no longer willing to negotiate on $60,000,000 valuation —Present grant has years to run

UNLESS the city of St. Louis, Mo., accepts the terms set out in the tentative service-at-cost franchise prepared by city officials and representatives of the reorganization committee of the United Railways by July 15, negotiations between the city and reorganizers on the basis of a $60,000,000 rate-base valuation will be terminated. After that date all negotiations will be on the basis of rate-base valuation fixed by the Missouri Public Service Commission or the United States courts. A letter to this effect has been sent to Mayor Victor J. Miller. It is expected that eventually the Public Service Commission will fix a valuation of $75,000,000 with an allowed return of 7 per cent.

The principal hitch has been Mayor Miller's refusal to approve a 7 per cent return on the company's investment. He has contended that under a service-at-cost plan of operation a 6 per cent return is sufficient.

The tentative draft of the service-at-cost measure was completed about a year ago. It has been hanging fire ever since.

Sam W. Greenland, representative of the reorganization committee and of the St. Louis Public Service Company, the proposed successor company, said that the letter to Mayor Miller should not be regarded as an ultimatum, but that future franchise negotiations would be on a basis different from the $60,000,000 valuation. Failure of the city to act by July 15 will not terminate negotiations on a new franchise.

On July 5 the new fare schedule of 8 cents or two tokens for 15 cents went into effect. Children's fares remain 3 cents.

The United Railways still has a blanket franchise extending from twelve to eighteen years, so is not entirely dependent on the city granting a new franchise at this time. If it does not receive a new franchise it probably will set up an amortization fund to take care of outstanding securities by the time the franchise does expire.

It appears now that the failure of the St. Louis city administration to agree on an equitable franchise to be granted to the St. Louis Public Service Company, when that organization takes over the properties of the United Railways, now in receivership, may cost the city treasury about $2,000,000 on the pending mill tax judgment of 1919.

The question of the payment of the entire mill tax judgment of $2,396,321 with interest at 6 per cent since Jan. 13, 1919, was one of the points raised in the tentative franchise prepared and dis-

Digitized by Google

cussed about a year ago. It was suggested then that this entire amount be paid to the city over a period of years.

Since Mayor Miller has failed to agree to a 7 per cent return on a $60,000,000 valuation, and members of the reorganization committee have threatened to call off negotiations with the city the mill tax judgment might have to take its place with other general claims against the system. Settlement of such claims must yet be approved by United States Judge Faris. He has jurisdiction over the receivership and has indicated that no interest can be allowed to general creditors on their claims. If the mill tax judgment is treated on that basis the city would lose $1,198,160 in interest up to July 13. It would probably also be forced to accept about 60 per cent of the principal sum due in final settlement or another loss of $959,321.

Completion of Great Northern Electrification Expected Jan. 1

At the present rate of progress, with speed records being broken almost every month, the Great Northern Railroad's 8-mile tunnel in the Cascade mountains will be ready for service before the end of next year. Electrification of 74 miles of line, including that through the tunnel, will be completed at the same time. Ralph Budd, president of the Great Northern, has indicated that while the Great Northern is electrifying a portion of its line through the Cascades, there is no immediate intention of electrifying any large proportion of the system. The Cascades electrification was undertaken to solve a particular problem set up by a mountain range summit difficult to cross. In discussing the matter, Mr. Budd said:

On the basis of economy, the high initial cost of electrification presupposes a heavy traffic in order to absorb the large overhead expenses. Not many railways have traffic so dense as to justify the expenditure, hence in most cases electrification is made on account of one or more other reasons, such as avoidance of smoke and gas in tunnels and snow sheds, elimination of fire hazards, speeding up of train service, particularly over mountain grades, and consequent increase in capacity of the line without building additional tracks in locations where such construction would be especially costly, smoke abatement in cities and solving terminal congestion problems.

In addition to the $10,000,000 which will be spent in construction of the tunnel, approximately the same amount will be required for electrification of the tunnel division and the revision of 17 miles of track on the east approach to the tunnel.

Celebration Reunites 400 Baltimore Veterans

Although looking forward is the commonly accepted formula for retaining youth, frequently senescence escapes those who find their chief delight in looking back. This habit evocative of pleasant memories is becoming an event in Baltimore when members of the 25-Year Club gather together for their annual outing, hear many stories of "when you and I were young" and indulge in all pastimes with the dynamic earnestness and hearty enthusiasm characteristic of the youngsters.

At Bay Shore Park on June 27, 422 veterans of the United Railways & Electric Company celebrated the fourth annual reunion of the 25-Year Club. According to reports, it was a crowded afternoon, what with bathing, bowling, aero swing, racer dip, shooting, rough riding exhibition in the pony corral, candy booths and kewpie doll stalls. When the day was done a good dinner and good music followed, and then Thomas A. Cross, retiring president of the club, presided at the election of officers.

The gathering was notable for more than one reason, but principally because thirteen ladies took part in the festivities —all young members of the 25-Year Club. Only thirteen, with more than 400 men! That was their lucky day.

It is at such reunions that the salutary atmosphere of employee relationship is breathed which becomes the life-giving serum for these veterans, who are near and yet very far from senility.

The 25-Year Club of the United Railways was organized March 4, 1924, with 234 members, all of whom had been with the street railway of Baltimore 25 years. The membership has grown to 432 members, as additional employees have become eligible through 25 years of service.

Pittsburgh Parking Violators Face "Drastic" Penalty

An open letter under date of June 16 addressed to the Mayor of Pittsburgh, Pa., by the Better Traffic Committee outlines the activities of that committee generally, but specifically to state its support of the Mayor's veto of the "reduction of parking penalties" ordinance.

The commmittee believes that the "reduction of parking penalties" ordinance, recently passed by the Council against the recommendation of the Better Traffic Committee, was a step in the wrong direction; that the increased parking in the business streets, which is bound to result under a reduced penalty, will react as an "automobile fence" around business houses in every district of the city. It is the belief of the committee that the vast number of citizens going daily into the downtown triangle should receive first consideration, and that the automobile should give way on the American theory of "the greatest good for the greatest number." The Better Traffic Committee states that it is interested in seeing that the greatest number of people of Pittsburgh get the maximum service from their streets in the form of transportation use.

The statement mentions the number of meetings held by the committee and the time consumed. To illustrate the many phases to the problem of traffic the committee has attached to its letter a list of some of the many things which have been studied carefullly by the Better Traffic Committee during the past year. The committee was appointed by Mayor Kline in May, 1926.

Permit Card in San Antonio

A new fare schedule providing for a 10-cent cash rate, three tokens for 25 cents and a nickel card good for one week to sell for 30 cents went into effect on the lines of the San Antonio Public Service Company, San Antonio, Tex., on July 10. About 12,000 nickel cards were sold the first week. As the city administration had not given its approval the permit card was put in over the latter's protest.

Where the heavy hand of time leaves no impression. Even the camera man said of the

Improvement Program in Dallas 75 Per Cent Complete

The Dallas Railway & Terminal Company, Dallas, Tex., has completed about 75 per cent of the construction program authorized by what is known as Everman Plan No. 4, under which it was granted an increase in fares to 7 cents cash with five tokens for 30 cents in return for an expenditure of $1,466,297 in improvements and betterments. A list of main projects completed under this agreement and their cost, as shown by records in the office of John W. Everman, supervisor of public utilities, includes the following:

STATEMENT OF PRINCIPAL DALLAS IMPROVEMENT ITEMS

Pay balance on car trust certificates	$137,484
Live Oak street rebuilding	54,000
Paving assessment— Jefferson Avenue	12,000
Second Avenue extension	15,000
Sunset extension	5,000
Vickery extension	15,000
Second Avenue paving	14,140
Commerce Street paving	12,000
Ferney Avenue paving	20,650
Pave Lancaster intersection	376
Pave Polk Street intersection	395
Pave Ross Avenue	773
Rebuild Elm Street	70,000
Purchase 30 Peter Witt cars	450,000
Install electric feeders	35,000
Pave Marlborough	12,893
Extend State Street line	48,000
Extend Oak Lawn line	40,000
Pave Fairmount Street	12,000
Rebuilding and pave McKinney Avenue	26,000
Pave Exposition Avenue	5,006
Pave four intersections	1,284
Pave two intersections	326
Total estimated costs of completed improvements	$1,059,331

Several big projects called for under the Everman Plan No. 4 are now under way. These include: Rebuilding tracks and paving portions of Cole Avenue between Bowen and Lemmon, $22,000 (about one-half completed); paving of Bryan Street and replacement of old track and roadbed with heavier steel and new ties, $75,000 (the Texas Electric Railway's interurban cars use the line of Bryan Street); conversion of fifteen additional two-man street cars of old type to modern one-man type, $50,000.

Among the projects yet to be done are: Junius Heights line extension, $59,000; rebuilding line on Tyler Avenue from Seventh to Jefferson and paving portions of this street, $35,000; rearrangement of tracks and paving on Parry Avenue at Fair Park, $1,450; paving on Waverly Drive, $7,000; rebuilding tracks on Upper Main Street, $83,000; rebuilding line on Collette Avenue, $24,000.

Efforts Made to Save Indiana Line

Boonville, Ind., newspapers are appealing to the public for more support for the Evansville, Suburban & Newburgh Traction Company, which operates from Evansville, Ind., to Boonville and Newburgh. In a recent issue the Boonville *Enquirer* pointed out that Posey County would soon experience a change in mode of transit from points in that county to and from Evansville if the Indiana Public Service Commission granted a request made by the Evansville & Ohio Valley Railway. In this petition permission was sought to substitute buses and operate them along State Highway No. 62 and do away with the railway that runs from Evansville to Mount Vernon. The company claims inability to operate its lines with a profit.

Winnipeg System Doing Well

The monthly bulletin published by the Winnipeg Electric Company, Winnipeg, Man., for its shareholders, states that the company has kept abreast of modern developments in the transportation business by providing supplementary bus services in various city and suburban districts. At present the company has a fleet of 30 buses of modern design and construction in operation.

In dealing with the effect of the increase in motor cars on the business of the railway, the bulletin says that between 1920 and 1924 the company experienced a decrease of 10,000,000 in its passengers, but that now the tide seems to have turned, for between 1924 and 1925 the number of revenue passengers jumped from 55,077,901 to 57,985,144.

Best of all the increase in passengers is being maintained this year. Fares in Winnipeg average only 5.86 cents. The cash fare is 7 cents, but special tickets are sold to children and workmen. The bulletin concludes by indicating that the future holds more promise for the transportation end of the company's operations than has been the case in the past twelve years.

Contracts Being Drawn for Rochester Tunnel Operation

The office of Corporation Counsel Clarence M. Platt of Rochester is engaged in drafting contracts between the city and the New York State Railways, interurban lines and the four steam railways for use of the city-built subway in the bed of the abandoned Erie Canal in the heart of Rochester, N. Y.

The Council has approved a plan whereby the New York State Railways is to operate the line for a trial period of three years, under a contract similar to, yet different in details from, the service-at-cost agreement under which the railway and bus systems of the city are operated.

It was found necessary to draft separate contracts with each system using the line. The railroads affected are the Rochester & Eastern, Rochester, Lockport & Buffalo and the Rochester & Syracuse Railroads, all interurbans, and the steam lines are the Lehigh Valley, New York Central, Erie, Pennsylvania and Buffalo, Rochester & Pittsburgh.

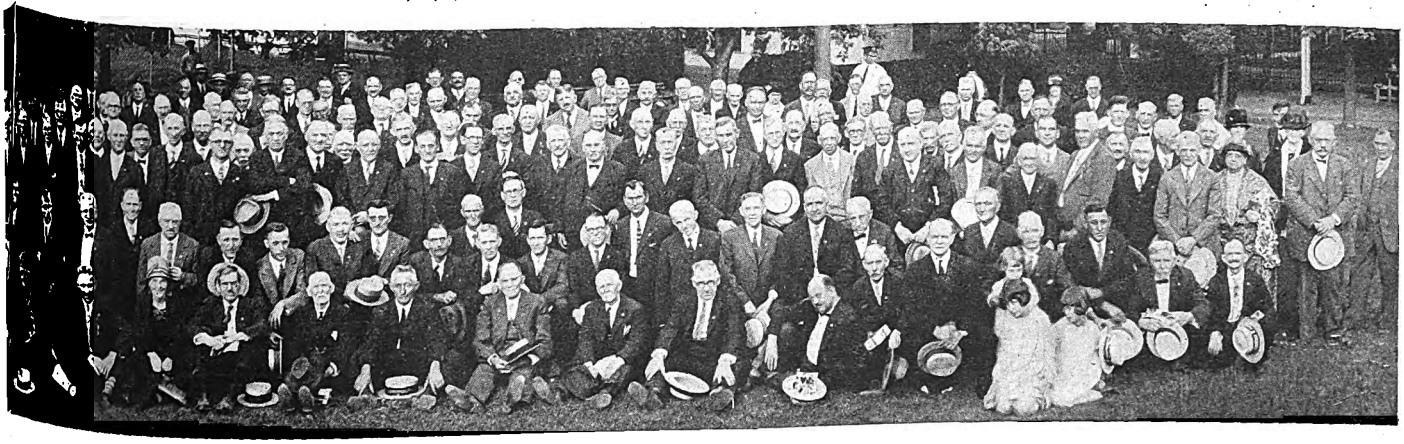
According to present indications the subway will start operations about Aug. 15. All of the electric signals may not be installed then, but it is thought that the interurban cars will start using the railroad then so that the heavy cars may be taken off the city streets.

Rotogravure Advertising by Boston "L"

The Boston Elevated Railway, Boston, Mass., entered in the rotogravure section of two recent issues of the Boston *Traveler* a full-page advertisement bespeaking the service and safety of that system.

The elevated, the surface car and the motor coach were pictured with a sketch of "Boston" and the shore line in the June 25 *Traveler* in conjunction with paragraphs telling of the convenience, safety, service, dependability, courtesy and genuine interest of the system in the welfare of the passengers.

The advertisement of July 2 showed by means of nine pictures, 2¼ in. x 3 in., and two larger pictures about twice the size of the others, "How the Boston Elevated Safeguards the Lives of 1,000,000 Persons Daily."



United Railways & Electric Company employees, "They may be veterans, but they don't look it."

Present Wage Rates Accepted by Connecticut Men

After a week of agitation, during which it was thought the wage disagreement between the Connecticut Company, New Haven, Conn., and its employees would have to be settled by arbitration, the clouds suddenly lifted and the men decided to accept the present wage rates for another year.

By accepting terms with the railway the men will work at the following rates: Two-man car operators will receive 62 cents an hour; one-man car operators 69 cents an hour. The men sought increases to 75 and 90 cents in respective instances. The Connecticut Company has conceded a slight change in working hours.

Former Railway Man Heads Ad Club

Hudson R. Biery, public relations director of the Cincinnati Street Railway, Cincinnati, Ohio, was elected president of the Advertisers' Club of that city by the board of governors at the Chamber of Commerce. Mr. Biery resigned as assistant to the receiver of the Indianapolis & Cincinnati Traction Company, Rushville, Ind., in September, 1925. He went to Indianapolis in October, 1923. Previous to that he was purchasing agent of the Union Traction Company at Anderson, Ind. He was with the Indianapolis & Cincinnati Traction Company during the extensive rehabilitation carried out in 1923 and in 1924.

Low Rates for Employees

The Pacific Electric Railway, Los Angeles, Cal., has announced that the company will continue to operate the Redondo Beach resort during the coming summer season and employees are reminded that they can obtain special reduced rates at the bathhouse and ballroom. Special books of tickets, seven for $1.35, are issued at the bathhouse to employees, and special books of dance tickets include 40 for $1.

I. C. C. Concludes Piedmont & Northern Hearing

Ten days after it started at Charlotte, N. C., the hearing on the petition of the Piedmont & Northern Railway, an electric line, for permission to extend its lines was concluded.

The hearing revolved around the desire of operators of the electric railway, owned by the James B. Duke interests, to complete the gap between Spartanburg, S. C., and Gastonia, N. C., and to extend the road to Winston-Salem, N. C. It developed into one of the hardest railroad fights in years.

During the proceedings plans were divulged for a new trunk line system to the South through communication of the routing of New York and Western freight over the Southern Railway to connect with the Georgia & Florida Railroad at Greensboro, N. C., and thence run into Florida.

Testimony by experts for the opposing railroads, including the Louisville & Nashville, Southern Railway, Carolina, Clinchfield & Ohio and the Atlantic Coast Line, made it appear that the electric railway was likely to become a very important factor in the coal traffic flowing into the great industrial region of North Carolina and South Carolina.

The hearing was closed after counsel for the Piedmont & Northern announced that their rebuttal testimony had been concluded and attorneys for the Southern Railway had introduced a number of documents into the record.

Direct connection by rail between the Virginia coal fields and the Piedmont section to the south would be established with construction of the proposed lines, and a through rail route from the Carolina sections into the north and west provided. The proposed new trackage would run from Gastonia, N. C., to Spartanburg, S. C., and from Winston-Salem to Charlotte.

Travel Tip Campaign in Los Angeles

At this the beginning of the outing and excursion season an appeal has been made to the entire family of the Pacific Electric Railway, Los Angeles, Cal., to assist in making the 1927 season the banner one in its history. The employee is enlisted as a personal solicitor in supplying the passenger traffic department with tips concerning prospective group passenger movements. Upon the receipt of tips, traveling passenger agents are assigned to make personal calls, to quote fares which are considerably lower than regular fares when a large group is handled, to suggest locations, to help to plan and to offer assistance in arranging details of the contemplated trip.

Blank on which business tips are recorded

Through its company paper the railway announces that the situation this year with respect to supplying equipment for extra movement is better than any year previous "and in the handling of this business nothing will be left undone in the way of making patrons highly pleased with their outings and our service."

For added convenience a blank form has been printed, reproduced herewith, showing information desired when turning in business tips.

Surface Lines Franchise in Chicago Extended

The City Council of Chicago, Ill., by a vote of 38 to 4 has extended for four months the franchise under which the street railway lines are now operated. The original franchise granted in 1907 expired on Jan. 31 of this year. A six-month extension was then voted, bringing it up to July 31. Bills looking toward a settlement of the matter failed in the Legislature, but a special session seems to be in prospect.

Utility Makes Gift to Higher Education

For the next five years an appropriation of $10,000 will be made by the Public Service Electric & Gas Company of New Jersey to Princeton University to be used in pure science work in chemistry. Thomas N. McCarter, president of the utility, explained that his company recognized that if industries with which it was concerned were to develop, the work of pure science had to continue and be supported by those who profited from its results.

Chicago Railways Will Pay Bond Interest Aug. 1

With traffic on the Chicago Surface Lines establishing new high marks each month and total revenue showing a favorable increase, the Chicago Railways, operating the north and west side lines, has announced its intention to pay the semi-annual interest due on Aug. 1 on all classes of bonds, although the principal of the bonds is in default.

It is expected that attorneys for the receivers of the company will within a few days present an application to the federal court for authority to make the interest payments. This plan applies to all the company's bond issues except the income bonds, payable if earned next May.

In endeavoring to maintain interest payments the company will follow the example of the Chicago City Railway, which announced last month that the semi-annual interest due on Aug. 1 on its bonds would be paid.

$300,000,000 Bond Proposal Opposed by Realtors

Taxpayers were urged to vote against the proposed $300,000,000 constitutional amendment to be submitted this fall in a statement issued by Stewart Browne, president of the United Real Estate Owners' Association, on the ground that "money can't be earmarked" and that the increase in the city's borrowing capacity authorized by the amendment would be used for recapture of subways. Mr. Browne asserted that since the city could use other borrowing power for recapture if the amendment passed, the prohibition that the identical

Digitized by Google

$300,000,000 should not be used for recapture was meaningless. Mr. Browne said:

Transit unification, as discussed in the Transit Commission open hearings with Mr. Untermyer as counsel, has developed into the proposed purchase of existing subways by the city and the $300,000,000 will be used for this purpose. The opinion of the realty interests is that if the existing and new subways are municipally operated they will be run extravagantly and inefficiently, and with the sole purpose of increasing the number of city employees for voting purposes.

Ohio Line Recoups Losses

The Dayton & Troy Electric Railway, operating out of Dayton, Ohio, is doing more business than ever before following the installation of new rolling stock and equipment during the past few years. This equipment is being operated on a regular schedule, serving a wide territory, reaching the upper part of the Miami Valley and the northern part of Ohio.

Some time ago the Dayton & Troy Electric Railway expanded and improved its freight service, so it is now possible for second morning delivery of freight to Chicago or Pittsburgh. Many Dayton manufacturers and merchants have been availing themselves of this rapid freight delivery.

Fares Increased in Kalamazoo

Increased fares went into effect on July 7 on the Kalamazoo lines of the Michigan Electric Railway as the result of action taken unanimously by the City Commission. The new fares are 10 cents for cash rides instead of 8 cents and three tokens for a quarter instead of four for a quarter. Increase in the fares was voted after the commission heard a report showing the company lost heavily last year and declaring the only alternative would be abandonment of railway service for a substitute mode of transportation to be provided by the city itself.

West Penn Veterans Honored at Sixth Annual Banquet

Employees who have been in the service of the West Penn System, Pittsburgh, Pa., for twenty years or more were honored at the sixth annual banquet, held at McCreery's, Pittsburgh, on May 26. Twenty, 25 and 35-year service buttons were presented to the employees of the West Penn Power Company by President Gadsby and to the West Penn Railway employees by President H. L. Mitchell. This year's banquet in honor of the veterans was distinguished from its predecessors by the presence of H. Hobart Porter, president of the American Water Works & Electric Company, who made the main address of the evening. More than 1,000 employees of the companies comprising the West Penn System were present.

Terminal Garage at Morden Aids London Parking Problem

Commuters living on the southwestern outskirts of London are helping to solve the city's traffic problem by driving their cars as far as the terminal garage at Morden and proceeding the rest of the trip by railway, thus effecting automobile and railway cooperation. The garage was opened last September by the City & South London Railway. Since that time more than 1,700 vehicles have been housed, many of them regularly. The length of the day for garaging has been extended from 5 a.m. to 1 a.m., but the premises are never closed. Petroleum and oil are supplied and repair facilities are provided. A breakdown lorry is also provided, and tires and batteries can be bought there.

Paris Subway Receipts Gain

Paris subway receipts for the first quarter of 1927 are quoted at 93,890,541 francs and the number of passengers carried at 138,956,923, according to an announcement made by the Trade Commissioner at Paris to the Department of Commerce. The number of passengers in this period is nearly 2,000,000 patrons fewer than for the first quarter of 1926. Increase in fares for both first and second class subway service, however, swelled the receipts during the first quarter of the present year to 21,265,338 francs in excess of those for a similar period in 1926.

Italian Railway Electrification Progressing

The electrified portion from Pistoia to Bagni of the Porretta Railway of Italy was opened recently. This is the first section of the Florence-Bologna line, which will be opened to traffic before the end of the present year. Electric power for this railway comes from Santa Croce in Venetia and Liro in the Alta Valtellina and is transformed near Bologna. During the year another 865 km. of track will be converted. By the end of 1928 it is estimated that there will be a total of 1,600 km. of electrified lines in Italy.

Partial Electrification in Brazil Will Be Completed Soon

Plans of the Paulista Railway in Brazil call for the completion this year of the electrification from Rio Claro to Rincao, the end of the broad gage line. This extension of about 94 miles will bring the total of the electrified line to 177 miles. The Paulista is the first steam road in Brazil to replace steam locomotives with electrics. The first electric operation was started in 1921 from the terminal point, Jundiahy, to Campinas, a distance of 27 miles. In 1925 the electrified zone was extended approximately 30 miles from Campinas to Tatu, and last year another 25 miles was added, from Tatu to Rio Claro.

For the electrification of the final section, from Ria Claro to Rincao, the International General Electric Company will supply equipment for two substations and three 145-ton passenger locomotives, and Milliken towers with Locke insulators of Hewlett suspension type for double transmission line will be used.

The original substation is of 4,500 kw. capacity and all of the others 3,000 kw. The Paulista Railway serves a coffee-producing area to the northwest of São Paulo. Its terminal, Jundiahy, is about 37 miles inland from that city and connects there with the São Paulo Railway, which is the connecting link with the port city of Santos.

Lisbon Issues 50 Per Cent Stock Dividend

At the annual meeting held in London, June 22, 1927, of the Lisbon Electric Tramways, Ltd., of Lisbon, Portugal, the directors recommended a 50 per cent stock dividend. The earnings of the Companhia Carris de Ferro de Lisboa for 1926 showed income, after operating expenses, fixed charges and payments to the retiring sinking fund, of £230,826, with a credit balance from last year of £9,122. After paying interest on the preferred stock, 6 per cent on the common stock, £100,000 to the general reserve and £17,000 to other reserves, it was possible to use £51,066 to pay the final preferred dividends, which were in arrears, and carry a balance of £8,307 to next year. As there was an accumulated reserve at the end of the year of £320,755, it was decided to issue 317,013 common shares at £1 each in the form of a stock dividend. During 1926 the tramways carried 97,422,768 passengers, compared with 89,687,293 in 1925.

Swiss Line Palezieux to Berne Electrified

Change from steam to electric trains in Switzerland on the route between Palezieux and Berne by the way of Fribourg has necessitated the reconstruction of six bridges. The heaviest work was done on the Grandfey viaduct, which crosses the River Sarine near Fribourg. This bridge, the longest and highest in the Swiss Federal Railroads system, is 1,255 ft. long and 262.5 ft. high. The cost of its reconstruction was 3,250,000 Swiss francs.

Electric Traction Progress in Poland

The Société Chemins de Fer Electriques Suburbains has obtained the concession for the construction and working of an electric railroad, about 30 miles in length, connecting Warsaw, Grodzisk and Zyrardow. Work is well advanced on the construction of the line as far as Grodzisk, 20 miles.

Recent Bus Developments

Missouri Bus Applications Besiege Commission

With Missouri's new bus regulation law effective on July 3, the State Public Service Commission is now receiving many applications for certificates of convenience and necessity for the operation of bus lines on the highways of the state. There are approximately 100 bus lines using the streets and roads of the state and it is expected that all of them will apply for the certificates that will enable them to continue in business. Hearings on the various applications will begin within the next few days and will continue for a month or more, until all of the petitions have been disposed of.

The first application for increased bus fares was received by the state commission on July 5. The Springfield Traction Company, Springfield, Mo., which operates buses in conjunction with its car lines, asked for an increase in bus fares from 5 cents to 7 cents, contending that the buses had been operating at a loss. The Springfield car fare is 7 cents. When the voters of Springfield passed an initiative ordinance in 1921 authorizing the traction company to take over and operate a number of bus lines owned by independent operators they fixed the bus fare at 5 cents.

The new bus regulation law defines the motor vehicle, motor carrier, public highway and common carrier; vests the public service commission with authority to license, supervise and regulate the motor carriers; states that the charges must be just and reasonable; requires the carrier to obtain a certificate declaring that public convenience and necessity will be promoted, and forbids any discontinuance of service without an order from the commission. It also fixes the license fee, which ranges from $40 to $230 annually; requires the filing of a liability insurance policy or bond, provides for distribution of safety rules and regulations by the commission and contains sections necessary for the enforcement of the law.

Jitneys Kept Out of Downtown Miami

Circuit Judge Atkinson has indicated that he will hand down an order in favor of the city and the Miami Beach Railway in the jitney litigation. Unless his ruling is reversed by the Supreme Court, the order will permit the city to enforce an ordinance that will rule "jitneys" from the downtown streets.

Attorneys for the city and the Miami Beach Railway, defendants in the action, have been instructed by Judge Atkinson to draw up an order in their favor. This is being done by John P. Stokes, who represented the city with City Attorney J. W. Watson, Jr.

Through an agreement of counsel for both sides, enforcement of the ordinance has been withheld pending the decision. The jitney operators declared the ordinance to be unconstitutional and attacked the contract under which the railway operates the city-owned buses.

The new ordinance is based on the belief that the jitneys constitute traffic hazards and increase congestion. Jitneys will be permitted to operate to the streets bordering the congested area, but will not be allowed to come downtown.

Rights Sought in New Rochelle

Application was made to the City Council of New Rochelle, N. Y., on June 20 by the Third Avenue Railway for permission to operate buses. It was stated that a similar application would be made to the Public Service Commission. It was said that Third Avenue officials would consult with Mayor McLaughlin with the idea of making White Plains the terminal of another line. City officials of Mount Vernon and the village presidents of Pelham, Pelham Manor and other communities, have been approached by Third Avenue Railway officials in connection with the proposed bus lines.

Louisville Railway Directors Favor Bus Deal

Directors of the Louisville Railway, Louisville, Ky., on July 7 authorized the purchase of the People's Transit Company, a bus concern, which operated six machines on the streets of Louisville for a short time in January. The deal will not actually be closed until a clear title can be obtained to all assets and provided that other details of the negotiations are satisfactorily arranged. The People's Transit Company was barred by injunction obtained by the Louisville Railway from operating on the streets of Louisville for lack of a franchise and later the Court of Appeals upheld the lower court's decision.

Several days ago officials of the railway conferred with Mayor Joseph T. O'Neal about increased service. These plans called for extension of some trolley lines, abandonment of others and the taking in of more territory by buses.

Bus System Included in Utility Group

The Salem Gas Company of Salem, N. C., and the Carolina Coach Company, which operates interurban buses between Raleigh, Durham, Greensboro and other cities in the Piedmont district of North Carolina, are to be included in the Southern Cities Utilities Company system.

Buses in Almont-Imlay City Service

A. L. Drum, receiver of the Detroit United Railway and associated properties, has announced that service on the interurban line north of Romeo and running through Almont to Imlay City will be abandoned. Service will continue between Detroit and Romeo with five round trips daily. In lieu of the rail service to Almont and Imlay City, Mr. Drum, through the Wolverine Transit Company, one of the bus subsidiaries in receivership, will install coach operation out of Romeo, giving four round trips daily.

The abandonment of the Imlay City service, which has been operated under the corporate name of the Detroit, Almont & Northern Railway, makes the sixth rail abandonment since the receivership, the others being part of the Orchard Lake division, the Saline and Plymouth divisions of the Detroit, Jackson & Chicago Railway, the lower end of the Wyandotte & Trenton division, and part of the Detroit, Monroe & Toledo Short line.

Coach Service in Cincinnati at 25 Cents

The Cincinnati Street Railway, Cincinnati, Ohio, has started operation of "de luxe coach service" from Government Square to Reading and Paddack Roads. The buses will not operate on Sundays. On weekdays, except Saturday, buses will leave Paddack and Reading Roads at 8 and 8:45 a.m., arriving at Government Square at 8:20 and 9:05 a.m. In the afternoon buses will start from Government Square at 4:20, 5:05 and 5:50 p.m. The morning schedule on Saturdays will be the same as other days, but the afternoon schedule provides for a trip from Government Square at 12 noon and 12:45 p.m. There will be no late Saturday afternoon trips. The fare is 25 cents

Preparing for Substitution in Morristown

The Mayor and Board of Aldermen of Morristown, N. J., on July 6 granted a permit to the Morris County Traction Company to operate buses there instead of trolleys. Under the terms of the franchise the operation of buses is to begin 60 days from the date of the approval by the Public Utilities Commission of the municipal consents obtained by the company from the various municipalities between Maplewood and Lake Hopatcong, through which the buses are to run.

The local franchise provides that removal of the trolley tracks, wires and poles and other appurtenances from Speedwell Avenue and the restoration of that street to good condition must be completed within 60 days from the date of the beginning of the operation of buses. All of the expense of track removal, poles and wires and street re-

Digitized by Google

pairing is to be borne by the railway. Another provision is that the tracks, poles and wires and appurtenances will be removed from the streets circling the public park and Morris Street within 60 days after demand from the Mayor and Aldermen. The bus fare is to be the same as the minimum charge imposed in like zones in other municipalities through which the buses will be operated.

Robert Schenck, who appeared for the company, explained that in the event that approval is granted by the Public Utilities Commission the next move will be to have the order of the commission sanctioned by the federal court.

Lines in Indiana Show Heavy Losses in 1926

Nearly one-third of all motor coach companies in Indiana were operated last year at a loss, it is revealed in a table made public recently by the State Public Service Commission. According to the commission's reckoning, which is based on annual reports of the bus companies, the aggregate operating deficit was $890,647. Total revenues of the 184 companies included in the table were $5,176,653 while total expenses, including depreciation charges were $6,067,300. Of the 55 companies showing deficits the greatest loss was in the case of the Shore Line Motor Coach Company, a subsidiary of the Gary Railways and the Chicago, South Shore & South Bend Railroad. This company reported a deficit of $222,837.

The second heaviest loser was the Indianapolis Street Railway bus system, with a deficit of $203,530, and the third was the Union Traction Company, with $138,865. Most successful from the standpoint of earnings was the Peoples Motor Coach Company, Indianapolis, which showed an income of $15,520.

Final Step in Bus Project Being Taken

The Springfield Street Railway, Springfield, Mass., is planning to operate a bus line between Worcester and Springfield. Six new buses will be used over a route which will follow closely the present railway. Final moves in the matter of obtaining licenses from all towns are being completed. Traveling time by bus will be 2½ hours, or about an hour less than that for the trip by railway between the two cities.

Would Demand Fee for Damages

Mayor Frank Doyle of East St. Louis, Ill., has declared war on interstate bus lines which operate through the city without paying any license fee to the municipality. He has instructed City Comptroller Jerre Kane to communicate with the various bus lines to ascertain whether they are willing to pay something toward repairing damage to the streets of East St. Louis caused by their buses. The United States Supreme Court has held that interstate bus lines are not subject to local taxation or license fees.

Co-ordination at Worcester

Railway in "heart of the commonwealth" creates faith and patronage by modernizing and safeguarding riders

THE Worcester Consolidated Street Railway, Worcester, Mass., serving the "Heart of the Commonwealth" by cars and buses, has completed a part of its rehabilitation plan and hopes to complete the rest of it certainly early next year. Just recently the company withdrew cars from non-paying interurban lines from Worcester to Worcester County points, among them the main line from Worcester to Fitchburg and the Blackstone Valley lines. In both these cases service is being rendered by the New England Transportation Company, a subsidiary of the New York, New Haven & Hartford Railroad.

Rearrangement of schedules, establishment of raised safety zones on all main streets, operation of company buses in districts not served by trolleys and feeding into main lines have quickened schedules, while the renovation of rolling stock and improvement of equipment in general, included in the first half of the rejuvenation plan, have resulted in ready response from the riding public. As part of the second half of its program the company has purchased 50 new cars.

Bus "competition" at Worcester has changed to bus "co-operation." Late to start, the Worcester Consolidated is leading in its field in co-operation. In recent years the character of the railway in Worcester has entirely changed. Prior to the year 1921 the maximum number of passengers was carried from May to September, inclusive. Beginning with the year 1921 the maximum number of passengers was carried from November to April. Between 1905 and 1910 there were very few automobiles, but since 1910 the registration of automobiles in Massachusetts has increased on an ascending scale. The increase was greatest in 1922 and 1923, in which years registration advanced about 116,000 vehicles. Not until 1923, however, did bus competition become serious. It is an old story with slight variations. Up to that time the buses were little more than trucks on which a passenger-carrying body had been placed. They went under the name of jitneys. Then came the bus that was a bus, and with it came real competition. The railway has met this competition by purchasing buses and now operates 38 of them. Service is given in various parts of the city of Worcester where the railway has been discontinued. Only three strictly city bus lines are operated and these are in parts of the city where no railway service has previously been given. An officer of the company said to the correspondent of the JOURNAL:

In our opinion the demand for buses is less this year than it was last. This is shown by the attitude of some of the towns in which we have abandoned railway service. Some of the towns have insisted that street cars be continued and have stated that they did not care to have the buses. However, the majority of the people still seem to desire bus transportation in the outlying districts, and for that reason buses have been substituted for some of the railway lines.

Railway Objects to Bus Project

A fight is being waged in Knoxville, Tenn., over the petition of the Rapid Transit Company for a franchise to operate buses over five routes in the city. The petition was presented to the City Council by the committee on June 20, and at a subsequent hearing H. G. Fowler, attorney of the Rapid Transit Company, said that the establishment of the five bus routes would, by opening up more satisfactory transportation lands now undeveloped, promote orderly growth and by this promotion increase the tax aggregate of the city so as greatly to relieve the pressing problem of municipal taxation. It is said the railway contends that if additional transportation is necessary it should have first opportunity to supply it because it has been the only common carrier in the city since the beginning of the transportation business.

Would Substitute Buses for Railway Service

The Danville Street Railway & Light Company has asked the Illinois Commerce Commission for permission to install buses on the Danville, Ill., Junction line to replace the electric cars. The Junction line was built by the late Uncle Joe Cannon and his brother, William P. Cannon, in 1882. Mules were the original motive power, but were replaced in 1891 by electricity. At the time it was built the Junction line was the longest in the city, but was never extended. The Danville company has been using buses to supplement street cars for about a year, but the move to stop the Junction line is the first effort to substitute buses for electric equipment.

Proposal to Be Renewed in Tarrytown

It is said that the next move in the controversy over the substitution of buses for the electric railway on the Tarrytown line will be made by the Third Avenue Railroad, New York, with a petition for a 20-cent fare to allow it to continue to operate trolleys. The petition will be presented to the Tarrytown Village Board, which recently denied the application for buses, principally on the objection that the purposed differential between the old fare on the railway and the fare suggested for the buses was too great.

Financial *and* Corporate

Stock of Cleveland Railway Offered by Syndicate

A syndicate which included Hayden, Miller & Company, Otis & Company, Union Trust Company, Cleveland Trust Company and the Guardian Trust Company, all of Cleveland, offered $3,580,000 of capital stock of the Cleveland Railway for subscription recently at $102½ per share. This is a 6 per cent issue. The circular of the bankers describes briefly the franchise terms under which the railway operates. The present offering presumably is part of the program under which additional stock of the company was offered to current holders in the spring on the basis of the right to subscribe for one additional share for each ten shares then held. The plan was described in the ELECTRIC RAILWAY JOURNAL for April 23, 1927, at which time it was said that a syndicate would take such stock as was not subscribed by the present holders.

San Francisco-Sacramento Bonds Deposits to Be Kept Intact

Letters have been sent to bondholders of the San Francisco-Sacramento Railway by the Harris Trust & Savings Bank, E. H. Rollins & Sons and three associates advising that deposits of bonds made with the Wells Fargo Bank & Union Trust Company be kept intact until after the outcome of proposals for the purchase of the remainder of the stock of the line in the interests of the Western Pacific Railroad is seen. As explained at length in the ELECTRIC RAILWAY JOURNAL for July 9, page 80, January interest and sinking fund requirements were met on advances in behalf of the Western Pacific. The road in the first four months this year shows a deficit of $37,132, before interest, so that the July payment cannot be met without further assistance. It is indicated to bondholders that credit of the electric railway will be maintained if the stock purchase offer is met. If it is not, foreclosure probably will result immediately upon the expiration of 60 days of grace after any default of the July 1 payments.

Hocker Line to Cease Operations

The Kansas City, Lawrence & Topeka Electric Railroad (Hocker line), running from Kansas City to Zarah, Kan., through Merriam and Shawnee, will cease operations on July 31 and will be sold at public auction under an order granted recently by Judge John C. Pollock of the federal court in Kansas City, Kan. The date of the auction has not been set.

The order was at the request of Peter W. Goebel, receiver for the line and president of the Liberty National Bank. The receiver's petition requested the termination of the receivership and sale of the property as scrap.

The road, which is 12 miles long, has been in receivership since January, 1919. Judge Pollock's order ends proposals to sell the line to the Kansas City Public Service Company. Negotiations for such a sale were held early this year following a survey of the electric line by Fred G. Buffe, general manager of the Kansas City Public Service Company.

Patience Suggested

Holders of the first mortgage 5 per cent bonds of the Youngstown & Ohio River Railroad, Leetonia, Ohio, are being urged to exercise patience with respect to the interest due them on this issue. The hope is expressed that by Oct. 1 the situation will be clarified sufficiently to enable accurate judgment to be formed about the immediate future. It is suggested the bondholders take no action before that time. The opinion is expressed that it is not necessary at the present time, in the absence of litigation by individual bondholders, to form a bondholders' protective committee, call for deposits of bonds, or ask the appointment of a receiver. Coupons due on April 1, 1927, on this issue were not paid. There was a postponement until June 30, but even then the funds were not on hand to meet the interest due.

For many years the Youngstown & Ohio Railroad earned much more than its bond interest. It did this even during the war period, when most other railroads were going behind. For the past two years, however, earnings have been small, owing to the closing down of coal mines and the consequent depression of business in the territory served. The strike itself would not have injured the company seriously, but the train of events that followed it made things difficult for the railroad. The road is said now to be earning its operating expenses and taxes so that the physical value of the property is being maintained.

C. F. Denison, Boston, and Francis Ralston Welsh, Philadelphia, who recommend patience on the part of the bondholders, say that the management is extremely able. They and the trustees under the mortgage feel that the management can maintain and operate the property more economically and more advantageously than could probably be done under a receivership. The prospects are that during the next three to six months the coal situation will clear up, and the hope is expressed that the time is not far distant when the road will again earn its interest and cure its default.

Tacoma Statistics Revealed

Average fare being paid by revenue passengers of the Tacoma Railway & Power Company, Tacoma, Wash., under the present tariff, including the 30-cent weekly ticket with 5-cent additional fare, is 1.21 cents higher than it was in 1926, when the $1.25 weekly pass was sold. This is based on a comparison of financial figures for May compared with the corresponding month of last year. The average revenue passenger fare last month was 7.46 cents, as against 6.25 cents for May, 1926. The average fare for all passengers, including transfer passengers, free riders and all kinds, was 5.42 cents for last month, against 5.12 cents for the similar month of last year.

In submitting his report, Richard T. Sullivan, manager, commented that the company concurred in the opinion of Kenneth G. Harlan, city utilities expert, that the present fares ought to be left unchanged pending the company's reply to the Harlan report. This document is due before Aug. 14, unless the City Council could suggest a fare which would produce more net revenue, as the net still is insufficient to pay a proper return.

The Council replied that it agreed to leaving the fare unchanged pending the company reply in writing, but disagreed with all other parts of the company statement. The Council was advised by Mr. Harlan that he cannot concede the company's figures as correct as there are items of expense in dispute. According to him the deficit of $181,716 claimed for the eleven months under the terms of the agreement for experimental operations would be about offset by the expenses which he regards as unwarranted charges.

The total number of passengers carried last month was 2,045,568, compared with 1,998,975 passengers in May, 1926, but the revenue passenger total of 1,485,720 was less than the figure of 1,637,783 for the corresponding month of 1926.

According to company figures net revenue in May after deduction of taxes was $6,097, or $15,569 less than the city and company agreed upon as a minimum return.

Committees Approve Indiana Merger

All committees of security holders have approved the plan for consolidating the Central Indiana Power Company and subsidiaries and the Terre Haute, Indianapolis & Eastern Traction Company and certain of its subsidiaries. The new company will be called the Indiana Electric Corporation, which is the name of an operating subsidiary of the Central Indiana Power Company, which latter is the chief subsidiary of the American Public Utilities Company, an Insull organization. As a preliminary to consolidation, Central Indiana Power will acquire all assets of five of its subsidiaries, canceling all their obligations not publicly held and

Digitized by Google

assuming those publicly held to the amount of $2,015,350 as underlying divisional bonds. The plan is subject to approval by the Indiana Public Service Commission. It was reviewed in the JOURNAL for June 25, page 1156.

Receiver Appointed for Indiana Road

Federal Judge T. W. Slick has appointed R. R. Smith, vice-president and general manager of the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., receiver of the company. The petition was filed by the Westinghouse Electric & Manufacturing Company, which claims an unpaid account of $3,177.45. The line operates between Michigan City and Goshen, and maintains city service in South Bend, Laporte, Michigan City, Mishawaka, Elkhart and Goshen. More than 120 miles of line is involved, 47 miles of which is in paved streets. Mr. Smith said:

Since the advent of the automobile, but more particularly since the beginning of the World War in 1914, the electric railway industry has been faced with some very serious financial problems. The increasing cost of labor which came with the World War made our problem an exceedingly difficult one. In addition to the increase in costs the continuously growing competition of privately owned automobiles has made some such step as we have just been forced into almost inevitable.

Our company has battled for a number of years, endeavoring to give good service to the public which it serves and endeavoring to keep pace with transportation necessities of our growing city. When the Westinghouse company saw fit to bring this action we decided it was inevitable and therefore did not contest. Under this receivership the lines will continue to operate and in the end I hope I may be able to work out the problem so that the communities we serve will get even better service than in the past.

Steam Roads Reported After Washington-Baltimore Electric

Reports have been revived that the steam railroads are after the Washington, Baltimore & Annapolis Railroad. As the electric railroad parallels the Baltimore & Ohio from Washington to Baltimore, it is thought in some quarters that the electric line will finally come into the hands of the B. & O. with the Pennsylvania as a competitor.

Control of the electric railway was acquired recently by the Consolidated Gas, Electric Light & Power Company of Baltimore through the acquisition of 32,429 shares of common and 19,148 shares of preferred stock of the electric line. These holdings are to be vested with an organization known as the Baltimore Corporation of Maryland, according to a petition now before the Maryland Public Service Commission. Utility men believe that Consolidated is not desirous of entering the rapid transit business and that it bought the electric railway to acquire the Annapolis & Chesapeake Bay Power Company, a subsidiary of the electric railroad.

Increase in Traffic on Lines of Chicago, Aurora & Elgin

The operating revenue of the Chicago, Aurora & Elgin Railroad, Chicago, Ill., for the year ended Dec. 31, 1926, not including non-operating income of $179,321, was $2,807,574, an increase of $99,957, notwithstanding the fact that the 1925 figures included revenue from the sale of power to various customers, for a full twelve months period, while the revenue for the past year includes these power sales for only two months of the year. The total revenue from transportation for 1926 was $2,469,371. This was an increase of $183,653 over 1925. The net income for the year 1926 was $93,122. These figures were included in the annual report of the corporation, which includes statistics of the railroad. Operating expenses were $2,405,483, an increase of $293,053. This increase in expenses is the result of the substantially improved standard of service. The improved service embraces not only more adequate facilities for the convenience and comfort of passengers, but also the operation of additional crossing protection, block signal circuits and other safety devices for the protection of the public in general as well as employees of the company.

INCOME STATEMENT OF THE CHICAGO, AURORA & ELGIN RAILROAD
(For the year ended Dec. 31, 1926)

Transportation operating revenue		$2,469,371
Other railway operations		338,202
		$2,807,574
Operating expenses:		
Way and structures	$224,693	
Equipment	197,246	
Power	538,902	
Conducting transportation	770,653	
Traffic	70,611	
General and miscellaneous	603,375	
		2,405,483
Net revenue from railway operations		$402,090
Net loss from auxiliary operations	$4,705	
Taxes	120,328	
		125,033
Operating income		$277,057
Non-operating income		179,321
Gross income		$456,378
Interest on funded debt	$327,340	
Other deductions		35,916
Deductions from gross income		363,256
Net income		$93,122

SURPLUS ACCOUNT

Balance Jan. 1, 1926		$871,373
Surplus brought over from Chicago, Westchester & Western Railroad	$108,865	
Less: Sundry adjustments —Chicago, Aurora & Elgin Railroad	91,961	
		16,903
		$888,276
Net income for year ended Dec. 31, 1926	$93,122	
Dividends paid on prior lien preferred stock	30,524	
		62,597
Surplus, Dec. 31, 1926		$950,874

INCOME ACCOUNT

	1926	1925	1924
Income:			
Interest on bank deposits	$2,051	$484	$645
Interest on securities owned	10,960	.....	.....
Total income	$13,012	$484	$645
Expenses:			
Miscellaneous expenses	10,219	4,938	3,086
Net earnings	$2,792	*$4,453	*$2,440
Accrued interest on debenture bonds	360,000	360,000	270,000
Deficit	$357,207	$346,453	$272,440

*Deficit.

	Revenue Passengers Carried	Car-Miles Operated	Total Tons Freight Handled
1922	5,141,271	4,035,311	141,831
1923	5,665,978	4,344,500	346,570
1924	6,148,302	4,556,105	396,573
1925	6,638,054	4,558,176	580,821
1926	6,997,793	4,869,947	638,249

An order was placed, the report states, for fifteen new passenger cars at an approximate cost of $562,000, for delivery about July 1, 1927. The purchase of these cars will be financed under the Philadelphia car trust plan. Each car will seat 52 passengers and will be equipped with the new bucket type seats which have been found to be so comfortable and satisfactory on de luxe motor coaches. They will have separate smoking compartments, complete toilet facilities and will be equipped with four 150-hp. motors. Particular attention has also been paid to car illumination and ventilation and to the necessary safety features. The cars when complete will weigh 102,000 lb.

For the purpose of protecting its territory from motor coach competition, the company has, through its subsidiary, the Western Motor Coach Company, filed an application with the Illinois Commerce Commission for certificates of convenience and necessity to operate over the main highways adjacent to the railroad. When the certficates are granted the company will operate a superior motor coach service which will connect with the railroad at various convenient points and which will prove of substantial benefit to the communities it will serve and thus assist in the development of the territory.

The territory served by the transportation system of the company lies between the city of Chicago and the Fox River Valley, approximately 40 miles distant. It is apparent that the company serves a widely diversified territory, the principal activities of which are closely linked with Chicago. In the purely suburban residential territory between Wheaton and Maywood there is a total population of 25,000 people adjacent to the company's lines.

Hudson Valley Would Abandon Lines

The Hudson Valley Railway, Glens Falls, N. Y., has petitioned the Public Service Commission for the approval of the abandonment of the following portions of its route: Fort Edward to Thomson line, Northumberland to Stillwater line, South and Knight Street line in Glens Falls, the Depot line in Glens Falls and the Belt line in Glens Falls. The petition contends that these portions of its lines sought to be abandoned are no longer necessary for the successful operation of the road and that company intends to substitute bus service for railway service.

Personal Items

C. R. McMahon Goes to Oakland

C. R. McMahon, formerly superintendent of equipment of the Des Moines City Railway, Des Moines, Iowa, has been appointed assistant superintendent of equipment of the Key System Transit Company, Oakland, Cal. He assumed his new duties on July 1 at the Emeryville shops.

Mr. McMahon has had a long career in railroading, beginning with the Beaver Valley Traction Company in Pennsylvania. Here he went after leaving school in his native city of Beaver, Pa. He left this road in 1906 to take the position of carhouse foreman with the Virginia Railway & Power Company at Norfolk, Va., where he remained two years. In 1908 he became general foreman of the Utah Light & Traction Company in Salt Lake City. There he stayed for ten years, going in 1918 to the Des Moines City Railway.

C. R. McMahon

Mr. McMahon's immediate superior in his new work is W. P. Jackson. Both he and Mr. Jackson are under H. P. Bell, chief engineer of the Key System Transit Company.

Elections in Louisville

A. J. Brewer, former newspaper man, statistician for the Louisville Railway, Louisville, Ky., for the last four years, was elected acting secretary of the company at a meeting of its board of directors recently. Mr. Brewer takes over a portion of the duties of the late Samuel Gill Boyle, secretary-treasurer.

The directorate confirmed the appointment of Mrs. A. L. Humphrey as assistant treasurer.

R. G. Winans with Columbia Gas

R. G. Winans, for nearly two years field supervisor with the General Engineering & Management Corporation, resigned that position on July 1 to become affiliated with the Columbia Engineering & Management Corporation, a subsidiary of the Columbia Gas & Electric Corporation.

After he was graduated from Pratt Institute, Brooklyn, where he studied industrial electrical engineering in the School of Science and Engineering, Mr. Winans was employed in the switchboard and central station construction departments of the General Electric Company. He was afterward employed by the Schenectady Railway, but resigned as engineer of power and equipment to accept a position as assistant engineer with the New York State Public Service Commission, in which capacity he continued for ten years.

At the present time he is a member of the American Electric Railway Association and is serving on the committee of power generation and conversion of that association. In addition he is a member of the National Electric Light Association.

In his new position Mr. Winans will devote himself to the work of valuation and structure of rates as well as to matters pertaining to various states' public service commissions.

C. V. Wood, Jr., Leaves Providence—Other Changes

Clark V. Wood, Jr., has resigned as superintendent of the bus division of the United Electric Railways, Providence, R. I. Following Mr. Woods' retirement it was announced that Edward Dutton, transportation foreman of the bus division, would report to R. R. Anderson, superintendent of transportation, and that Harry Jardine, assistant superintendent of the bus division, had been appointed supervisor of bus equipment, reporting to Henry S. Day, superintendent of equipment.

The effect of these changes is to consolidate railway and bus operations under Superintendent of Transportation R. R. Anderson, and to consolidate maintenance of electric railway and automotive equipment under Superintendent of Equipment Henry S. Day.

Mr. Wood was called into the garage just before he left the company and found his men gathered there, to remind him that his going away was not to be passed over lightly. Before he could ask what it was all about E. S. Dutton stepped forward and presented to him a beautiful green gold Hamilton wrist watch, with a picture of a bus on the back and inscribed with the following words, "C. V. Wood, Jr., from the U. E. R. Bus Division Employees in Recognition of Our Pleasant Relations." Then Chief Inspector Huntoon stepped forward and presented to him a box of cigars, a humidor and a ten dollar gold piece. With the latter was a note which read: "Not to be spent until you are broke—hope you never will be."

E. L. Lockman Promoted at Boston

E. L. Lockman, of the maintenance department of the Boston Elevated Railway, Boston, Mass., has been promoted to be assistant to the superintendent of maintenance, H. M. Steward. This advancement comes as a logical step in Mr. Lockwood's railway career of 29 years, beginning with the Union Switch & Signal Company, by which he was employed on the signal and interlocking installation at the Boston South Terminal station. This led to a job in the New Haven's signal department, but in March, 1901, he was called back by the Union Switch & Signal Company to assist on the construction of signals and interlocking on the original elevated or rapid transit lines from Sullivan Square to Dudley Street in Boston.

When the elevated was opened on June 10, 1901, Mr. Lockman joined its staff as signal maintainer, becoming, in 1905, first signal foreman, then general foreman, signal division. As such he had charge of signal and interlocking construction in the Cambridge subway, from Harvard Square to Park Street.

E. L. Lockman

After nearly eleven years in the signal division Mr. Lockman spent nearly nine years as assistant roadmaster, rapid transit lines, and then until June 1, 1927, was assistant engineer of surface lines, when promoted to his new position.

Mr. Lockman is active in the research work of the American Electric Railway Engineering Association, on the committees on rail corrugation and on welding wire and specifications. He is a graduate in civil engineering of Northeastern University evening school of civil engineering and a member of the Boston Society of Civil Engineers, the New England Railroad Club and the New England Street Railway Club.

E. W. Brown Made Chief Engineer of Kentucky Utility

Edward W. Brown has been appointed chief engineer of the Kentucky Utilities Company and its subsidiaries, among them the electric, gas and railway services in Paducah. He succeeds George

Digitized by Google

T. Bogard, who became a vice-president and chief of operations March 15, last. Mr. Brown was born at Cobden, Ill., received his high school training at Metropolis, Ill., was graduated from the College of Engineering at the University of Illinois in 1910 and took special work at the Massachusetts Institute of Technology. After his collegiate career closed, Mr. Brown was employed successively by the Westinghouse Electric & Manufacturing Company, the General Electric Company and the Central Illinois Public Service Company. He joined the Kentucky Utilities Company in September, 1917, was plant superintendent at Pocket, Va., until 1920, later superintendent of operations, then district engineer.

W. A. Jones Made Doherty Vice-President

William Alton Jones, for the last two years chairman of the executive committee of Henry L. Doherty & Company, New York, has been elected first vice-president of Cities Service Company.

Mr. Jones has been with the Cities Service organization since 1912. Until he came to New York in 1921 he was at Joplin, Mo., where he served as treasurer of the Empire District Electric Company and associated companies. Mr. Jones is an officer or director of some fifty companies.

Changes on Central Division of New Jersey Road

Announcement has been made of the following changes in the Central Division of the Public Service Railway, Newark, N. J.:

D. W. Baird appointed supervisor at Elizabeth carhouse. Mr. Baird was supervisor at New Brunswick carhouse.

Patrick Creamer to be supervisor at New Brunswick carhouse. Mr. Creamer was supervisor at Perth Amboy carhouse. He will have supervision of Public Service Railroad cars west of Bonhamtown Junction.

Albert Carnot appointed supervisor at Perth Amboy carhouse. Mr. Carnot will continue to have supervision of Public Service Railroad cars east of Bonhamtown Junction.

Andrew Heuther, supervisor at Elizabeth carhouse, has been assigned to other duties.

W. B. Huffer Made General Traffic Manager

W. B. Huffer, for the last three years public relations representative of the Indianapolis, Columbus & Eastern Traction Company, Columbus, Ohio, will become general traffic manager of the company's lines, succeeding Arthur V. Bland, resigned. Mr. Huffer will have his headquarters in the Interurban building in Springfield, Ohio. He will be in charge of all matters pertaining to both passenger and freight traffic as well as over the public relations offices which will be moved to Springfield.

Messrs. Ellicott and Beck Advance

Westinghouse Brake makes one vice-president and other general sales manager

IMPORTANT changes in personnel are announced by the Westinghouse Air Brake Company. They concern Charles R. Ellicott and Carl H. Beck, both well known in the electric railway industry. Mr. Ellicott, Eastern manager of the company, has been elected resident vice-president with headquarters at New York. Mr. Beck, for seven years assistant Eastern manager at New York, has been appointed general sales manager with headquarters at Wilmerding.

C. R. Ellicott

Mr. Ellicott entered the employ of the Westinghouse Air Brake Company in August, 1902, as a special apprentice in the Wilmerding shops, and was later made mechanical expert at New York. From 1905 until 1912 he served as representative of the company, first in New York and then in Boston. He was appointed assistant Eastern manager in 1912 and promoted to the position of Eastern manager in 1920. He was born in Chicago, where he received his early education. In 1902 he was graduated as a Bachelor of Science from the Sheffield Scientific School at Yale University. Mr. Ellicott has always taken a prominent part in the affairs of the American Electric Railway Association, serving for many years as a member of the executive committee.

C. H. Beck

Mr. Beck entered the employ of the Westinghouse Air Brake Company as a special apprentice in 1905, and after filling shop and field assignments he was transferred to the St. Louis office in 1907, as steam road inspector. In 1909 he was advanced to the position of representative of the Westinghouse Traction Brake Company in the same city. This position he held until 1919, when he was made special representative of the Safety Car Devices Company at Wilmerding.

Mr. Beck's next promotion came in 1920, when he was made assistant Eastern manager of the Westinghouse Air Brake Company, a position he held until his new appointment on July 1. He was graduated from the Pennsylvania State College in 1905 as a Bachelor of Science and in 1911 received his M. E. degree from the same college. Mr. Beck has always taken a lively interest in all matters that pertain to the welfare of the electric railway industry. He was particularly active in promoting the introduction of the safety car.

OBITUARY

Wilmot Kirk Morley

Wilmot Kirk Morley, president of the Grand Rapids, Grand Haven & Muskegon Railway, died at his home in Grand Rapids, Mich., on July 13. Mr. Morley, who had spent his entire lifetime in railroad work, both steam and electric, was prominently known in the industry.

Mr. Morley started his career when thirteen years old in 1867, entering the service of the Chicago & Alton Railroad as station agent and operator at various stations. Later he was advanced to dispatcher at Bloomington, Ill., chief train dispatcher and finally superintendent of telegraph. In 1888 and until 1894 he filled the position of superintendent of the St. Louis & Kansas City division of the Chicago & Alton Railroad. Mr. Morley then removed to Grand Rapids to enter the electric railway industry, later becoming vice-president and general manager of the Grand Rapids, Grand Haven & Muskegon Railway. In this capacity he continued from 1903 until 1920. During the next two years he was succeeded by Sidney L. Vaughan, present manager under the receivership.

The association of Mr. Vaughan and Mr. Morley was cemented in 1925 when they took over the Grand Rapids, Grand Haven & Muskegon Railway from the owners in an effort to rehabilitate that property. Even though they succeeded only partially in achieving their hopes as interurban promoters they will always be regarded as pioneers in this phase of railway development, with which their names are inseparably connected.

Mr. Morley was born on Nov. 15, 1854, in Youngstown, Ohio.

Manufactures and the Markets

Super-Car Exhibit Predicted for October Convention

All indications at the headquarters of the exhibit committee of the American Electric Railway Association point to a super-car exhibit for the annual convention next October. Since the announcement of space assignments made in the JOURNAL of July 9, the following companies have indicated that they will contribute exhibits of unusual interest to the outdoor section. J. G. Brill Company's exhibit will include one city and one interurban car. The Differential Steel Car Company will present an electric dump car, electric locomotive crane car, concrete breaker and a three-way motor truck body.

Cincinnati, Hamilton & Dayton Railway has announced its intention of exhibiting five electric railway cars, two interurban cars, and one city type car, also two freight cars. The Cummings Car & Coach Company will have on the tracks two electric railway cars and one gas-electric drive snow sweeper. The St. Louis Car Company plans an interesting exhibit of electric railway cars and trucks. United Railways & Electric Company will display one articulated car and the Westinghouse Electric & Manufacturing Company will feature a 50-ton electric locomotive.

A highly interesting feature of this section of the exhibits will be one of the high-speed interurban electric articulated cars presented by the Washington, Baltimore & Annapolis Electric Railway. These units were recently placed in service and were fully described in the JOURNAL.

More-Jones Now Part of National Bearing Metals

The More-Jones Brass & Metal Company, established in 1874, incorporated in 1899, has reorganized, and is now a division of the National Bearing Metals Corporation, recently incorporated, with general offices at 4930 Manchester Avenue, St. Louis, Mo.

The following firms are also divisions of the National Bearing Metals Corporation: Bronze Metal Company, Meadville, Pa.; Bronze Metal Company, Jersey City, N. J.; Damascus Bronze Company, Pittsburgh, Pa.; Keystone Bronze Company, Pittsburgh, Pa., and Southern Brass Company, Norfolk, Va.

The new company will assume all contracts and obligations of these firms.

The More-Jones Brass & Metal Company will be called "More-Jones Brass & Metal Company Division" of the "National Bearing Metals Corporation," with main offices in St. Louis, Mo. In this connection the company is advising its customers that the facilities for serving them will remain the same—the same unexcelled products—the same prompt service—the same sales, office and foundry personnel. In the future all correspondence and orders intended for the More-Jones Brass & Metal Company should be addressed to the National Bearing Metals Corporation, More-Jones Brass & Metal Company Division, at the address in St. Louis given previously.

Flook Heads Brown Boveri

William M. Flook was elected July 6 chairman of the board of the American Brown Boveri Electric Corporation. Laurence R. Wilder, formerly president of the corporation, has become chairman of the advisory committee of the ship building division of the business.

Ten Cars and Four Buses for San Francisco Municipal Railway

The supervisors of San Francisco, Cal., have voted for ten new cars for use on the Judah Street and Duboce Tunnel lines. The $192,000 appropriated for the new municipal railway cars is to come out of the old depreciation reserve. There was a sharp debate over the $19,200 price per car, two supervisors claiming that the price was $6,500 more than was paid by the privately operated company run under similar conditions of service. In this connection Assistant City Engineer Nelson D. Eckert explained that the cars purchased by the Municipal Railway are the best in California and have a low depreciation because of their sturdy construction. Mr. Eckert declared that the cars bought by the municipality are noted for their long life, their low maintenance cost and their exceedingly high safety factor. An appropriation of $31,807 from the Municipal Railway reserve depreciation fund also was voted for the purchase of four buses to replace four of the original five purchased in 1923. The old buses have traveled more than 300,000 miles each.

Trolley Supply Company Sells Business to Ohio Brass

The Trolley Supply Company, Massillon, Ohio, has sold its electric railway business to the Ohio Brass Company. In the last year or so it has become engaged in the manufacture of a product entirely foreign to the street railway market and this now demands its entire manufacturing facilities.

The Ideal trolley catcher and the Knutson trolley retriever, heretofore manufactured by the Trolley Supply Company, will now be made and sold by the Ohio Brass Company. Repair parts for Simplex trolley bases may also be obtained from the latter company.

C. F. Elmes Engineering Consultant in Chicago

Cecil F. Elmes, whose testimony in the famous Indianapolis Water case largely resulted in wide recognition of the establishment of the method of depreciating the physical properties of public utilities, has announced his resignation as Western manager for Sanderson & Porter and the opening of his own engineering offices as the Cecil F. Elmes Organization in the Illinois Merchants Bank Building, Chicago. Mr. Elmes was with Sanderson & Porter for nearly twenty years and for the last nine years was in charge of the Chicago offices.

In his new business Mr. Elmes will not only buy, build and manage utility groups but will take an active part in the development of gas, electric and hydro-power industries. He recently completed a merger which resulted in the establishment of the Great Lakes Utility Company, with subsidiaries in Ohio, Michigan, Indiana and New York.

He is known as the author of "Appraisals and Rate Making," "Price Levels in Relation to Value" and a number of other works on public utilities.

General Electric Reports Business Good

Orders received by the General Electric Company for the three months ended June 30 amounted to $78,105,247, compared with $78,972,062 for the second quarter of 1926, a decrease of 1 per cent. For the six months ended June 30 orders totaled $155,655,828, representing a decrease of 6 per cent compared with $165,405,720 in the corresponding six months of 1926.

Changes in Westinghouse Brake Representatives

Westinghouse Air Brake Company, Pittsburgh, Pa., announces the appointment of E. W. Davis, representative of the company at Boston, Mass., to Southwestern manager, with headquarters at St. Louis, Mo. Raymond Boiselle, representative in the Pittsburgh district, has been transferred as representative to Boston, Mass., to succeed Mr. Davis.

Mr. Davis was graduated from Purdue University, Lafayette, Ind., with the mechanical engineering class. He served for several years with the Atchison, Topeka & Santa Fé, the Chicago, Burlington & Quincy and a number of industrial organizations, including the Westinghouse Automatic Steam Coupler Company. He entered the employ of the Westinghouse Air Brake Company in 1908 as inspector, and later served as assistant district engineer at New York. In 1919 he was appointed representative of the Westinghouse Traction Brake Company at the same place, and since 1922 served as representative at Boston.

Mr. Boiselle received his mechanical engineering education at the University of Illinois. He served on the Missouri

Digitized by Google

Pacific, the Atchison, Topeka & Santa Fé and the Chicago, Rock Island & Pacific. Entering the service of the Westinghouse Air Brake Company in 1912, he was employed in the test department until 1917. During the World War he served as first lieutenant and captain, Aerial Armament Division, overseas, returning to the Westinghouse service as mechanical expert in the Southwestern district, where he remained until 1923, since which time he has been representative in the Pittsburgh district.

Market for Copper, Zinc and Tin More Active

COPPER and zinc sold in larger volume in the week ended July 13 than for some time, with prices for each of these metals somewhat improved. Lead has been steady since the price declined July 1 and a fair amount of business has been done. Prices for prompt tin have declined a little further and dealers have lent more than the accustomed activity to the market. Silver is virtually unchanged.

Copper was still available on July 7 at 12½ cents, delivered at Connecticut points, and a good tonnage was sold, though there was a general tendency to mark prices up to 12⅝ cents, and some business was even done at the level. All of the 12½-cent copper had disappeared on July 8, 12⅝ cents being uniformly asked for Eastern deliveries and 12¾ cents in the Middle West. Business continued very satisfactory to and including July 11, but on July 12 and 13 demand moderated perceptibly, most sellers continuing to quote 12⅝ cents, delivered, but scattering sales of small lots were made at slight concessions, ranging from 12.55 to 12.60 cents, also.

Galvanizers were active buyers of zinc during the week ended July 13, the total sales for the week being the largest since early January. Most of the business has been done at 6.15 cents. Spot lots of high-grade continue nominal at 8 cents delivered in the East.

Buying of lead during the week has been fully up to the average in volume. The weakness in London, which threatened to divert Mexican ore lead to the domestic market, caused the American Smelting & Refining Company to cut its official contract price for New York delivery from 6.30 cents to 6.20 cents on July 7. On the same day the leading interest in the West reduced its price to regular customers from 6 cents to 5.95 cents. Storage battery manufacturers are showing more interest in the market, as are makers of ammunition and blue-lead products. Not since the summer of 1923, when New York lead for ten days sagged to 6 cents, has the metal been as low as at present. Of course if London continues to decline and domestic producers persist in excluding ore lead the price here may go still lower. Sentiment in the tin market is that prices should ease somewhat.

ELECTRIC RAILWAY MATERIAL PRICES—JULY 12, 1927

Metals—New York

Copper, electrolytic, cents per lb	12.36
Lead, cents per lb	6.20
Nickel, cents per lb	35.00
Zinc, cents per lb	6.53
Tin, Straits, cents per lb	63.625
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.425
Somerset mine run, Boston	1.775
Pittsburgh mine run, Pittsburgh	2.02
Franklin, Ill., screenings, Chicago	‡
Central, Ill., screenings, Chicago	‡
Kansas screenings, Kansas City	2.675

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.85
Tie plates (flat type), cents per lb	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.80
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.50
Sheet iron (24 gage), cents per lb	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb	3.20
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	12–17.50
Colored	7-14

‡ Quotations withdrawn because of strike.

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	11.0
White lead in oil (100 lb. keg), cents per lb.	14.0
Turpentine (bbl. lots), per gal	$0.60
Putty, 100 lb. tins, cents per lb	5.25–5.50

Wire—New York

Copper wire, cents per lb	14.25
Rubber-covered wire, No. 14, per 1,000 ft.	$5.15–$5.20
Weatherproof wire base, cents per lb	16.00

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ½-in., carload lots, N. Y., per cu.yd	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	10.625
Light copper, cents per lb	9.00
Heavy yellow brass, cents per lb	7.00
Zinc, old scrap, cents per lb	3.875
Lead, cents per lb. (heavy)	5.25
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	13.75
Rails (short), Chicago, gross ton	15.25
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

Ten Units Ordered by Chicago, North Shore & Milwaukee

Promised for delivery on Nov. 1, the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., has just placed an order for ten one-man, two-man, city type cars. The unit will be of all steel construction and weigh approximately 40,000 lb. Two of them will be equipped with Timken roller bearings. Subjoined are specifications as announced by Glenn H. Brittain, assistant engineer car equipment of the operating company.

Name of railway	Chicago, North Shore & Milwaukee Railroad
City and state	Chicago, Ill.
Number of units	10
Type of unit	One-man, two-man, motor, passenger, city, double end, double truck
Number of seats	56
Builder of car body	St. Louis Car Company
Date of delivery	Nov. 1
Weight, total, approximately	40,000 lb.
Bolster centers	28 ft. 0 in.
Length over all	51 ft. 0 in.
Length over body posts	37 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3⅜ in.
Height, rail to trolley base	11 ft. 9⅛ in.
Window post spacing	30 in.
Body	All steel
Roof	Arch
Air brakes	Westinghouse Traction Brake Company
Armature bearings	Plain
Axles	Standard Steel
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Metal
Control	General Electric K-35-KK
Curtain fixtures	National Lock Washer
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	End, folding, with treadle control
Energy saving device	Economy meter
Fare boxes	Johnson
Finish	Duco
Gears and pinions	General Electric Grade M
Glass	Plate
Hand brakes	Peacock and St. Louis
Hand straps	Rico
Heat insulating material	Cork
Heaters	Railway Utility
Headlights	Golden Glow SM-95
Headlining	Haskelite
Interior trim	Mahogany
Journal bearings	Eight cars plain, two cars Timken roller
Journal boxes	St. Louis
Lamp fixtures	Adams & Westlake
Motors	Four General Electric, inside hung
Registers	Tuttle and Bailey
Roof material	Canvas
Safety car devices	Complete equipment
Sash fixtures	O. M. Edwards
Seats	Hale-Kilburn No. 300
Seat spacing	2 ft. 6 in.
Seating material	L. C. Chase, grade C
Slack adjusters	Smith-Ward shim
Steps	Folding
Trolley catchers	Knutson No. 5
Trolley base	U. S. 20-C
Trolley wheels	More-Jones
Trucks	St. Louis
Ventilators	Railway Utility
Wheels, type	Rolled steel, 26 in.
Wheelguards	H-B life guards

More Oxygen and Acetylene Plants for Air Reduction

The Air Reduction Company, Inc., New York, has purchased the business, in so far as the manufacture and sale of oxygen, acetylene and kindred products are concerned, of the United Gas Improvement Contracting Company, a subsidiary of the United Gas Improvement Company, and the United Oxygen Company, Philadelphia. The purchase includes oxygen plants at Philadelphia, Chester, Milton, Enola, and Reading, Pa., and an acetylene plant at Bridgeport, Pa. Thus, the Air Reduction Sales Company, the sales organization of Air Reduction Company, Inc., has acquired through this purchase the production and distribution facilities of five

Digitized by Google

additional oxygen plants and one acetylene plant in the industrial district of eastern Pennsylvania. The company now operates 34 oxygen plants and nineteen acetylene plants, all located in or near principal industrial centers of the United States.

ROLLING STOCK

BOSTON ELEVATED RAILWAY, Boston, Mass., is reported to have ordered four air-dump cars from the Differential Steel Car Company, Findlay, Ohio. It has just accepted delivery of the second Mack gas-electric drive bus. This bus is a 29-passenger, four-cylinder model, having a single electric motor driving through a single drive shaft.

TWIN CITY RAPID TRANSIT COMPANY, St. Paul, Minn., has accepted delivery on six 230-in. wheelbase Mack bus chassis on which bodies will be built locally. This is the third repeat order, totaling thirteen Macks delivered to this company this year. Twin City now operates a fleet of 48 Macks.

SPRINGFIELD STREET RAILWAY, Springfield, Mass., has accepted delivery of its initial order of Mack buses. Included are six 29-passenger city type buses, four-cylinder model, 225-in. wheelbase. Twenty-four buses of various makes have been in operation for some time. The Macks will operate on the Orchard line and the Pine Point line, both suburban routes.

IOWA SOUTHERN UTILITIES, Centerville, Iowa, operating the Burlington Street Railway and the Ottumwa Street Railway, has accepted delivery on four 25-passenger Mack city type buses, four-cylinder model, 196-in. wheelbase, making a total of nineteen Macks which have been put in operation by these railways.

PUBLIC SERVICE TRANSPORTATION COMPANY, Newark, N. J., bus operating subsidiary of the Public Service Corporation, has received 23 Mack buses, completing one section of its order for 147 buses. The buses just delivered are 29-passenger city type, six-cylinder models, 233-in. wheelbase chassis. Forty buses of this type are now being operated.

TRACK AND LINE

THE WORCESTER CONSOLIDATED STREET RAILWAY, Worcester, Mass., announces the reconstruction of 3,100 ft. of track on June Street, Worcester, at an approximate cost of $20,000 as completed. This job required 95 tons rail, 1,544 ties, 20 kegs spikes, 105 joints, 630 track bolts, 105 bonds, 3,088 tie plates and 450 tie rods. Reconstruction of double track on Park Avenue, in the same city, has been completed at a cost of nearly $75,000 and a new branch-off is announced at Park Avenue and Maywood Street, at a cost of $3,000. This is in line with the company's plans for 1927, which included the purchase of cars.

PHILADELPHIA, PA. — The city of Philadelphia has awarded the Pierce Electric Company, Chicago, Ill., the contract for the third rail and bonding of the Broad Street subway, Philadelphia. The contract price is $132,200. The Pierce Electric Company is the same company that executed the electrical contract for the Illinois Central Railroad.

LOS ANGELES RAILWAY, Los Angeles, Cal., has under way two jobs of complete reconstruction of tracks. The first one is on the east side of the Southern Pacific tracks on Alameda at Vernon, and the second is on 53d Street between Main and San Pedro Streets. The old light rail formerly used is being replaced with 116-lb. girder rail.

SHOPS AND BUILDINGS

LOS ANGELES RAILWAY, Los Angeles, Cal., has just completed a new bus inspection and repair shop for its bus division which is reported as the last word in mechanical equipment for the inspection and repair of its fast growing bus fleet. The building is 100 ft. wide and 310 ft. long. It is of brick, steel and concrete construction and is equipped with the "wet pipe" automatic sprinkler system. A comprehensive study was made by the engineers of the company of the lighting and ventilating of the building, with a view to facilitating the work by providing the best working conditions for the mechanics. There are three bays to the building and three roofs arranged in sawtooth fashion, each sawtooth being equipped with skylights running the entire length of the building.

TRADE NOTES

S. E. CONYBEARE, advertising manager of the Armstrong Cork Company, Lancaster, Pa., and president of the Association of National Advertisers, has been elected a member of the board of directors of the Audit Bureau of Circulations. He will fill out the unexpired term of B. H. Bramble.

ROLLER-SMITH COMPANY, New York City, announces the following additions to its sales organization: William H. Neville, Age-Herald Building, Birmingham, Ala.; Atkinson Equipment Company, Atlanta Trust Company Building, Atlanta, Ga. Mr. Neville will cover the state of Alabama and the Atkinson Equipment Company will handle the company's business in Georgia.

LINCOLN ELECTRIC COMPANY, CLEVELAND, OHIO, announces the following changes and additions to its sales and service department. L. P. Henderson, formerly connected with the Detroit office, has been transferred to Chicago in charge of welder service; J. E. Durstine has been transferred from the experimental engineering department to welder service department at Cleveland. J. W. Shugars of the time study department at Cleveland, and R. D. Layman, also of Cleveland, have been moved to Detroit under the direction of J. M. Robinson. In addition to these changes D. H. Carver has been transferred from the machine shop division at Cleveland to the Ohio service division with headquarters at Cincinnati, and R. F. Terrill transferred from the general engineering department at Cleveland to the eastern service division with headquarters at New York City.

INGERSOLL-RAND COMPANY, New York, N. Y., in order to provide better sales and service facilities for its customers in northern New Jersey and certain adjacent counties of New York State, has opened a branch office at 236 High Street, Newark, N. J. F. K. Armstrong, formerly connected with the company's New York sales branch, has been appointed manager.

ROLLER-SMITH COMPANY, New York, N. Y., announces the appointment of the Petroleum Electric Company, 217 East Archer Street, Tulsa, Okla., as its representative for the state of Oklahoma. The Petroleum Electric Company will handle Roller-Smith instruments, circuit breakers and relays in that territory. The personnel of the agent company includes T. D. Williamson and C. F. Dagwell.

ADVERTISING LITERATURE

WALTER A. ZELNICKER SUPPLY COMPANY, ST. LOUIS, MO., has issued bulletins Nos. 337 and 338, covering track spikes, track bolts, tie plates, switch material, locomotives, motors, air compressors, boiler tanks, etc.

NEW DEPARTURE MANUFACTURING COMPANY, BRISTOL, CONN., is distributing a four-page circular dealing with the application of its ball bearings to the electric motor, special stress being laid on the economical side of such installation.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has recently issued Bulletin GEA No. 566, which is a handsome catalog descriptive of Novalux traffic signals.

GRISWOLD SAFETY SIGNAL COMPANY, MINNEAPOLIS, MINN., has issued a new mailing piece descriptive of its railroad crossing signs and street traffic intersection signals.

AMERICAN BROWN BOVERI ELECTRIC CORPORATION, New York City, announces that circular No. D.M. 7001 on "Constant Voltage—During Variable Loads" is available for distribution. This four-page pamphlet deals with the advantages attendant upon the use of the A.B.B. quick-acting, automatic voltage regulator. The circular is illustrated with halftones and line cuts.

O. M. EDWARDS COMPANY, INC., SYRACUSE, N. Y., has issued an attractive catalog, No. S-27, on metal sash. It is being distributed to all of the motor coach builders and operators and electric railway operators in this country and Canada. The new mailing piece is well illustrated.

An Interview with Mr. Chrysler

IT IS unfortunate that the flush of success in one line of business sometimes leads men to set themselves up as authorities on subjects of which they know practically nothing. Perhaps the spectacular personal successes that have come out of the automobile industry account for the effusions of opinion on subjects ranging the entire gamut of economic, social and industrial knowledge that seem to emanate from some of the men in that industry. Apparently this is attributable to the assumption that ability to build and sell a cheaper or a better automobile is ample qualification for bursting into the public prints on any subject under the sun.

One of the most recent flights of imagination, which betrays not only the author's entire ignorance of his subject but also an unfortunate disregard for the interests of a hard-pressed basic industry, is contained in a recent interview with Walter P. Chrysler published in the July 16 issue of *Collier's*. Under the subheading "The Trolley Car Is Doomed" Mr. Chrysler is quoted as follows:

> Our larger cities are completely out of date with their networks of trolley tracks and fleets of cumbersome street cars. In New York, Boston, Chicago, Philadelphia, St. Louis, Cleveland, Detroit, San Francisco and a dozen other cities it is simply criminal waste to tolerate them.
>
> Unsightly, clumsy and dangerous elevated railroads are a thing of the past. The air space could be used more efficiently for express motor routes.
>
> Our cities will be obliged to build double or triple-deck motor roads for different classes of traffic.

Thus nonchalantly does Mr. Chrysler read out of existence the sixth largest industry in the country—a utility upon which the very life of the modern American community depends. In a single breath he commits the future of American cities to double and triple-deck motor roads, without a thought as to where the money to finance such roads is to come from, or just how high the present excessive tax rate can be made. True, double and triple-deck roads will be necessary and will in fact be inadequate if all the people in the cities of the size he mentions are to be transported in individual machines.

It is interesting to note just how far Mr. Chrysler has permitted his imagination to lead him. According to the latest figures compiled by the National Automobile Chamber of Commerce, there were a total of 19,237,171 passenger automobiles registered in the country in 1926. Of these, 11.4 per cent, or 2,185,000, were in cities of 500,000 or more population. According to the census figures for 1920, which are obviously considerably below present conditions, the total population in these cities is 16,369,000. It is quickly evident that the number of automobiles is only 13.4 per cent of the population. Suppose we find street space for all of these automobiles to be used daily for the transportation of their owners and do away with street cars. What are the other 86.6 per cent of the people in these cities going to do for transportation?

In cities between 100,000 and 500,000 there is a total population of 16,326,000. There are in cities of this size a total of 2,251,000 automobile registrations. Here the ratio of cars to population is 13.8 per cent. In cities of from 50,000 to 100,000 population there are 5,266,000 people and 1,154,000 cars. The ratio of cars to population is slightly higher and amounts to 22 per cent. That leaves only 78 per cent of the population to find some means of acquiring an automobile for transportation.

An automobile ride costs the owner from 10 to 20 cents a mile, if he is physically and mentally able to drive himself under the congested traffic conditions that the automobile has brought about. How are you going to make it possible for every one to afford that kind of a transportation bill, Mr. Chrysler? How about that huge portion of the population to whom the price of even a street car ride is of some consequence? And remember, please, that we are talking now about direct transportation costs, not including the question of taxes to build and maintain those double and triple-deck streets you talk about. Don't you think, Mr. Chrysler, that as a transportation expert you are a pretty good automobile manufacturer and salesman?

Check Payments Reduce Danger of Payroll Robbery

PAYMENT of employees by check instead of by cash has proved to be an effective means of preventing the stealing of payrolls. In this movement the electric railway industry has played an important part. More than 50 railways in the United States and Canada have adopted the practice. The largest of these is the Public Service Railway of New Jersey. For the past year some 4,000 car and bus operators of this company have been paid by check, as well as several hundred clerks and officials. Details of the method of payment are given in an article appearing elsewhere in this issue. Other large companies which pay their employees by check are the Los Angeles Railway, the Market Street Railway of San Francisco, the Louisville Railway, the New Orleans Public Service, Inc., the Pennsylvania-Ohio system and the United Railways of St. Louis. In Canada the railways in Ottawa, Hull and Levis follow the same practice.

Advantages from the standpoint of safety of paying employees by check rather than by cash have long been recognized. The difficulty has been to devise a convenient method by which the employee could convert his check into cash. Comparatively few trainmen, shopmen or trackmen have checking accounts. Many banks, particularly in large cities, discourage the small depositor by making a charge for handling an account unless the average balance is several hundred dollars. Moreover, banking hours seldom coincide with the employees' time off duty. For these reasons, payment by check has often resulted in having the employee cash his check at a discount at some neighborhood store. Under these circum-

Digitized by Google

stances it is natural that the men should prefer cash payment.

Thus the essence of any successful plan is facilitating the cashing of the checks. This has been accomplished in several ways by Public Service Railway. Checks can be cashed at the carhouses or turned in by operators as part of their daily receipts. They can be cashed at any of the commercial offices of the Public Service Electric & Gas Company. An arrangement has been made with a number of banks whereby pay checks will be cashed for railway employees who are known, even though they are not depositors. Storekeepers are willing to accept these checks, and as other facilities for cashing them are plentiful, they do so without discount.

Apparently the steps taken to facilitate cashing the checks have eliminated all objections on the part of the employees. At the same time the danger of payroll robbery has been removed.

Copenhagen Congress Follows Lead of Geneva and Locarno

IMPORTANT steps to improve the business conditions of continental Europe were taken at the recent congress of business men held at Geneva. The proceedings there, like those of the statesmen who met at Locarno, proved the desire of the nations of western Europe to live in harmony with each other. Now comes the equally satisfactory news that the proposed consolidation of the two principal electric railway associations in central and western Europe was carried at the Copenhagen convention of the Internationaler Strassenbahn- und Kleinbahn Verein by a unanimous vote. Thus the disruption in electric railway relations, brought about by the war, has been repaired.

Prior to 1914 the various electric railway enterprises of Europe had one association, known as the Union Internationale de Tramways et de Chemins de fer d'Intérêt local, with headquarters at Brussels. Following the armistice, this association was reorganized to exclude railways in those countries which were hostile to the Allies during the conflict. Then the properties in central Europe organized their own association, in which the proceedings were held in the German language, and whose headquarters were in Vienna. It is this organization which has just voted in Copenhagen to dissolve.

The invitation to have again a single association came from the Union. With the invitation was the offer of the Union to increase the number of members of its executive committee by six, so as to include members from the principal countries in central Europe and to conduct and publish its proceedings in German and French, instead of in the latter language only. It was also agreed that a representative from Germany would be elected as vice-president of the association as soon as there should be a vacancy. As these terms were accepted, the Internationaler Strassenbahn- und Kleinbahn Verein has passed out of existence.

The new organization should greatly advance knowledge of the best practices in electric railroading. It should be of help not only to its own members but to electric railways throughout the world, including America. European electric railway companies have been pioneers in many branches of the art. They are now making notable advances in engineering, transportation and personnel work, as well as in the efficient coordination of buses, street railways and rapid transit lines, where they exist in the same city. In fact, outside of Great Britain, co-ordination of this kind is the rule in Europe. While electric railways abroad undoubtedly have much to learn from American practice, it is equally true that a great deal of value can be obtained in the United States from a study of the practice of European properties. In union there is strength, and the reorganized European association should have an honorab'e and useful future, as it has had an honorable and useful past.

When a Joke Is Not a Joke

VITRIOL is beginning to drip from the pens of the columnists over the ukase of E. F. Albee, who runs a chain of vaudeville theaters, admonishing: "Artists, don't be cheap or thoughtless," and trusting that in the future "artists will refrain from using cheap jokes not only in reference to street car companies but to any other industry, or officials of our nation, state and city."

Literary license is, of course, the privilege of the men who write these columns. They could not exist without it. Not always, but many times it does seem that the wit of these fellows is no less far fetched than that about which Mr. Albee has issued his admonition. Still the columnists entertain oftener than they oppress, and that is a fair balance. Under Mr. Albee's ruling, Heywood Broun of the New York *World* sees the lot of the vaudeville artist becoming increasingly hard, since he must already watch his step on jokes about prohibition, Brooklyn, big business, Mr. Sumner and religion.

There is, perhaps, justification for this feeling, but there is no justification for too literal interpretation of what Mr. Albee has said. Right at the moment Mr. Broun could not remember a good subway wheeze, but said that some there must be, and there could be others. He didn't think it was for Mr. Albee to draw up an indictment against all street car jokes, for "he can't have heard them all." The theatrical producer specifically said "cheap jokes." According to Mr. Albee "theaters are not places for criticism from our stages."

It will all grist for Mr. Broun's mill. He got more than half a column of comment out of the pronounciamento. But he did not differentiate. Even cleverness is no excuse for dissimulation. Not all of us can be indifferent to quips about us as the man who, when told that some one had been talking about him none too deferentially, said that he didn't care what was said about him so long as something was said. This is the extreme view. The electric railways do not share it. Neither does Mr. Albee. They realize as Shakespeare put it:

> But he that filches from me my good name
> Robs me of that which not enriches him
> And makes me poor, indeed.

If Mr. Albee had said the things that Mr. Broun apparently thinks he said, the columnist would be in the right. But as he did not, the JOURNAL feels compelled to align itself against the clever Heywood. Meanwhile, the vaudeville artists are in a position similar to the girl with the unattractive knee who wanted to know from the doctor who conducts the daily column of advice on medicine in her local paper whether she could do anything about it. At the risk of incurring the displeasure of both Mr. Albee and Mr. Broun, the answer is repeated that there was not a thing left for her to do but to grin and bear it. That the vaudeville artists must now do. And it is just as well. As for this industry, local

Digitized by Google

railway managers or their representatives might have a heart-to-heart talk with the managers of the theaters with the idea of each of them promoting the interests of the other, for Mr. Albee has distinctly said that "without the street cars, I can't conceive how our patrons could reach our theaters. All our patrons don't own automobiles."

Trackless Trolley Operation Waning in Popularity

WHEREAS optimistic prophecies once were heard on every hand concerning the important rôle that the trackless trolley was destined to play in local transportation these never have been realized in this country and statistics show a marked falling off in its use in recent years. Outstanding examples of trackless trolley installations were made from three to six years ago in Petersburg, Va.; Staten Island, N. Y.; Baltimore, Md.; Philadelphia, Pa.; Rochester, N. Y., and Cohoes, N. Y. In 1922 the electric railways in the United States and Canada bought a total of six trackless trolleys. Fifteen were bought the following year and seven in 1924. Since that time no more have been purchased. Financially the operations have not been a marked success. One of those mentioned above has been discontinued and the abandonment of another is in prospect.

At Petersburg trackless trolley operation on a route 3½ miles long was begun four years ago with five vehicles. The restrictions imposed by the city were such that this undertaking never had any real chance for success. The company was compelled to pay for a strip of concrete paving in the center of the street and confine its operation to that area. Thus the curb loading advantage of the trackless vehicle was lost. With concrete paving and hard rubber tires the operation was noisy and unattractive. Moreover, it was just as expensive as that of gasoline buses. Hence, at the beginning of this year the company withdrew the trackless trolleys and began the operation of buses in their stead.

On Staten Island, New York City, operation of trackless trolleys was begun in 1921 on 6 miles of route. A year later this was increased to 15 miles. At one time 22 vehicles were in service. According to latest reports, however, only seven trackless trolleys are now in operation on about 6 miles of route. The cost of operation is said to be about 12 cents per passenger carried, while the fare is only 5 cents, the deficit being made up by the city of New York.

Trackless trolley operation replaced bus operation on a suburban route in Baltimore in 1922. The change was made at the request of residents who desired a form of transportation that gave outward evidence of permanency. They agreed to underwrite the expected deficit to the extent of $32,000 during the first five years. Three trackless trolleys were operated on a 6½-mile route, divided into two 7-cent fare zones. Despite the arrangement for subsidizing this line it has not been profitable.

The Philadelphia Rapid Transit Company commenced the operation of seven trackless trolleys on a 5-mile route in 1923. At that time the fare was 7 cents cash, four tokens for 25 cents, and the operation was unprofitable. At present the fare is 8 cents cash, two tokens for 15 cents, and the operation is just about breaking even.

In 1923 the New York State Railways commenced operation of seven trackless trolleys on a 3-mile cross-town line at Rochester. The route runs through a well-built-up section and intersects five electric railway lines. The fare is 8 cents cash, two tickets for 15 cents. Trackless trolleys were selected to render this service on the theory that operating expenses, on a frequent stop line, would be less than that of motor buses. While latest reports show a failure to earn operating expenses, the management is well satisfied with the trackless trolleys and plans to continue their operation.

In Cohoes, N. Y., a suburb of Albany, a trackless trolley system was installed by the United Traction Company in 1924. Four vehicles are operated on a 3-mile route at a 7-cent fare. This service replaces that formerly given by electric rail cars. The substitution was made to enable the company to reduce its track and paving expenses and also to permit certain changes in the routing. Results of trackless trolley operation are reported by the management to be entirely satisfactory.

Outside of the United States, particularly in England, the trackless trolley has been used more widely than it has here. To a considerable extent this use has been similar to that of the motor bus in the United States in that the object has been to get rid of track and paving costs on lines where the traffic is light. The committee on foreign operation of the American Electric Railway Association reported after its extensive inspection trip in Europe in 1924 that some British tramway managers regard the trackless trolley as a vehicle intermediate between the bus for light traffic routes and the tramway for those where the traffic is heavy. This field is so narrow, however, that the committee felt that the trackless trolley could well be dispensed with. Whatever the ultimate fate of the trackless trolley may be abroad, it certainly appears to have passed the crest of its popularity in this country.

Better Acceleration Is Needed

WHEN the original Birney car was brought out a number of years ago the claim was made that it could be accelerated at 2½ to 3 m.p.h.p.s. and braked at virtually the same rate. With this car schedules could be speeded up and a measure of patronage lost in the smaller cities because of automobile competition could be regained.

The claim was substantiated, it is true. But the necessary strengthening and redesigning of certain parts added weight to the car up to 20 per cent or even more. In some of the later cars it was necessary to use motors of 30 hp. instead of the original 25-hp. motors, and even then the car was more sluggish than the original one. The rapid acceleration and braking were not maintained in many installations, so the advantages were not realized to any great extent. Meanwhile the development of the automobile has permitted it to use even faster acceleration than was customary ten years ago. Combined with higher maximum speeds in even the lightest types, the auto now far outstrips the car under city conditions.

Whatever the type of street car drive adopted, provision should be made in any new design for acceleration and braking at the highest rates that are permissible. If all parts of the equipment are properly proportioned, the rates which were adopted in the original safety car can be reached again today. No matter how comfortable the seats nor how attractive the finish, speed is today one of the most important factors that sell transportation. Cars that fail in this respect cannot hope to win the approval of the public for long. It goes without saying that the operators must take full advantage of the possibilities of the equipment and make the schedules as fast as practicable consistent with city ordinances and with safety.

High speed, passenger comfort and safety were sought in the design of these interurban cars for the C., H. & D.

New Passenger Cars

Bid for Patronage

on the C., H. & D.

Twenty-six new cars for interurban and city service replace obsolete equipment formerly operated. Passenger comfort, general attractiveness, safety and speed were given primary consideration

This is the second of a series of three articles, the first of which was published last week, covering the rehabilitation of the Cincinnati, Hamilton & Dayton Railway. Next week the improvements made in track, power supply and freight facilities, together with the new shop and yard, will complete the account of the measures taken to bring this interurban property up to date.

THE passenger service rendered by the C., H. & D. has been put on an entirely different plane of comfort and attractiveness by the purchase of 26 new passenger cars to replace obsolete and dilapidated equipment formerly in service. This includes seven single-end combination baggage and passenger cars for main-line service, three double-end passenger cars for the same service and for train operation, ten double-truck de luxe one-man, two-man cars for Dayton city service and for service between Dayton and Miamisburg, and six single-truck one-man cars for local service in the city of Hamilton. These last-named cars have been in operation since Dec. 24, 1926. In addition to this entirely new equipment there are in operation in Hamilton city service 22 other single-truck Birney safety cars, sixteen of which were bought in 1922 and six in 1924. The group of sixteen have all been completely rehabilitated by the Cincinnati Car Company.

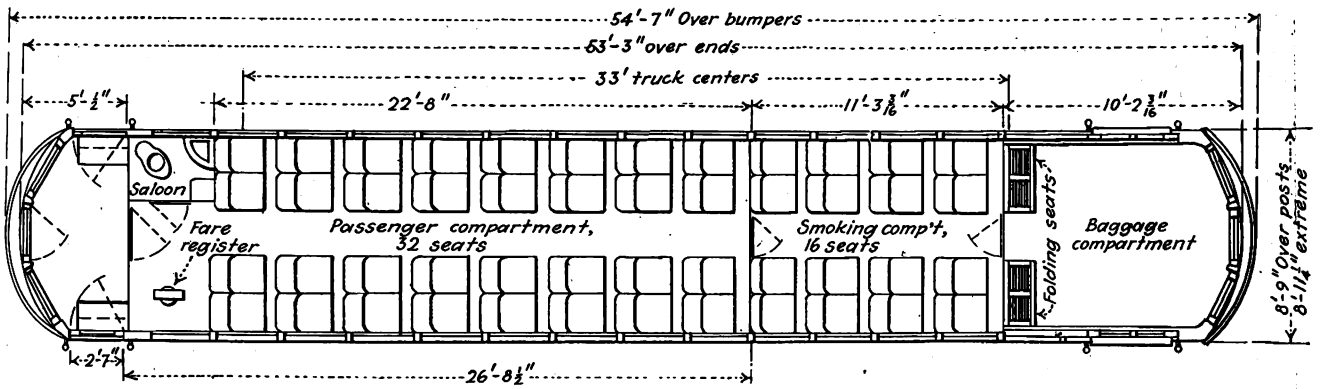
Seven center-entrance passenger cars of steel construction are in operation at the Dayton end of the line for hauling heavy industrial loads at the National Cash Register plant and the Frigidaire plant. These cars, five of which were built in 1914 and two in 1918, seat 70 passengers and weigh approximately 75,000 lb. each, equipped with multiple-unit control. They are capable of operation in trains of two or three cars for handling the heavy industrial peaks encountered in the rush hours.

Train Operation Contemplated

In the selection of the new interurban passenger cars several factors were considered. The present loading of the line is up to the limit of the seating capacity of the old cars, and on some runs it was necessary to operate cars double head with two train crews to avoid excessive crowding. The need for multiple-unit equipment which could be operated in trains seemed definite. It seemed logical therefore to take the step to multiple-unit control at the beginning of the new interurban car program. The size and weight of car selected was likewise dictated by the requirements of train operation. The object was to get sturdiness and solidity, which begets passenger comfort and confidence.

The structural strength, motor equipment and multiple-unit control that were considered necessary for the service

Digitized by Google



The single-end interurban cars have a baggage compartment at the front end. Fare collection will be by means of a ticket issuing register which is being tried experimentally

requirements added considerable weight over what would have been necessary with single car operation only. Since ultimate train operation was in view, it was considered important to have the car frames designed to stand up under the impacts to which they might be subjected in such service. The cars are mounted on 28-in. wheels and conventional type journal bearings, but are arranged so that they can be mounted on 37-in. wheels to bring them up to proper heights for subway operation in Cincinnati. The trucks are also arranged to take roller journal bearings if that ever becomes desirable.

On the outside, the new equipment is finished in Duco. The color scheme was selected to give durability and visibility. The management believes that one of the great hazards presented by the interurban car is that it does not give the impression of moving as rapidly as does the steam train. Consequently a brilliant Tuscan red is used for the entire exterior of the interurban cars. This, it is felt, insures visibility under conditions when there is snow on the ground, when the landscape is brown in early spring and late fall, or when the background is green, as in summer.

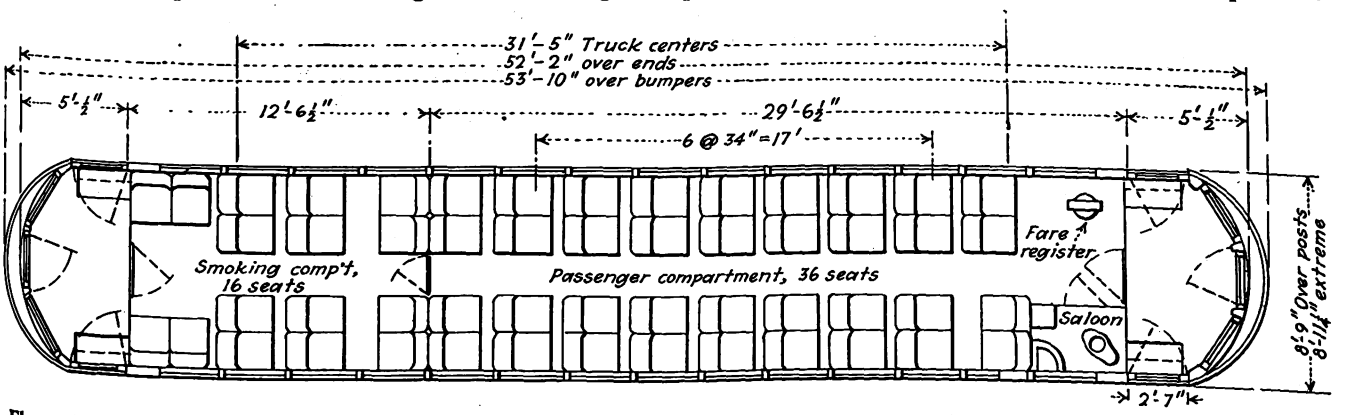
In selecting the interior finish for the cars, the basic industries of the district were considered. These are primarily the machine tool industry and the paper industry. For that reason practical requirements dictated the use of leather for seats, and the use of a color that would be as near to natural saddle leather as it was practicable to obtain. An interior finish was sought which would not give an early appearance of seediness after being used for some time by men whose clothes had been exposed for long periods to an oily atmosphere. To insure comfort to passengers, careful attention was given to the spacing and pitch of seats.

Electrically operated ticket issuing machines, designed by the National Cash Register Company, that are an adaptation of that company's station machines, are to be experimentally used on the new interurban cars. This method of fare collection is novel and is still considered to be only in the experimental stage. The register itself is electrically operated to give speed, but is made compact and light to facilitate moving it about from one end of the car to the other. The registrations are arranged so that the conductor can print the passenger's ticket quickly, showing the station at which he boarded, the station to which he paid his fare, the amount of the fare and other desirable information. In addition to giving this information on the ticket, there is available in the machine a complete audit of the entire day's operations with a complete record of every passenger trip.

Designed to Attract Riders

General dimensions and specifications of the interurban cars are listed in accompanying tabulations. They possess a combination of features that should go far toward attracting the riding public. In exterior appearance they have pleasing lines. They are mounted on Brill No. 77-E-2 trucks designed for easy riding at high speed. The interior woodwork is mahogany. Center dome lights, cream ceilings and large windows further contribute to the passengers' comfort. The leather seats are luxuriously padded and fitted with foot and arm rests. A rubber tile floor covering adds to the appearance of the interior. Westinghouse multiple-unit HL control and Tomlinson automatic air and electric couplers with bus line contacts provide for train operation.

Seven of the bodies are of the combination type, fitted with passenger, smoking and baggage compartments. They will be operated normally from one end only. The remaining three have passenger and smoking compartments only and will be used for double-end operation



Floor plan of double-end interurban. Three of these cars are to be used for train operation when more than a single unit is needed

and as the second car in two-car trains. The single-end cars must be operated at the head of the train due to the fact that they have couplers at the rear only.

The underframe of the cars is of steel throughout. The side sills are 3-in. x 3-in. x ⅜-in. rolled-steel angles extending the full length of the car. The end sills are of the "built up" type with a top and bottom cover plate and a diaphragm filler. The cross members consist of 3-in., 4.1-lb. rolled-steel channels extending the full width of the car between the side sill angles. The center sills, which are 8-in., 11.25-lb. rolled-steel channels, extend the full length of the car and are fastened to the front and rear bumper. The bolsters are also of the "built up" type and are fastened to the center sills, side sills and side sill reinforcing angle. The bumpers are made from 8-in., 11.25-lb. rolled-steel channels inverted and reinforced on the outside with a four-ribbed 7-in. section of Hedley anti-climber. Provision has been made to resist collision with higher cars by placing 12-in. x 18-in. gusset plates between the vestibule posts and the center sills.

The roof is arched and is covered with $\frac{7}{16}$-in. poplar and No. 8 canvas. The front vestibule of the single-end cars has three single windows with stationary sash. The rear vestibule has two similar windows with a train door in the middle. On the double-end cars the vestibules at each end are alike, having the two stationary windows and one train door. The steps are stationary.

At one corner of the passenger compartment is a toilet, completely equipped in Pullman fashion and with a 25-gal. water tank located between the car roof and the ceiling. The interior of the passenger compartment is finished in mahogany; ¼-in. Agasote is used for the headlining and ¼-in. Haskelite between the windows and the floor. A layer of celotex is installed as an insulator between the belt rail and the floor. The windows are single sash, thirteen per side on the single-end cars and fourteen on the double-end unit. They are fitted with curtains, which match the car interior in color. The absence of the upper sash leaves considerable space, which has been used for a neat parcel and baggage rack.

Passenger comfort was considered of prime importance in the selection of the seats. They were furnished by Hale & Kilburn. In the single-end cars they are double stationary chair type arranged in pairs, fitted with arm and foot rests and upholstered with genuine leather. In the double-end cars the seats are much the same type, but are of rotating reversible construction. The single-end car seats 32 passengers in the passenger compartment and sixteen in the smoking compartment, making a total of 48. This is exclusive of two passenger seats that are omitted at one corner for the fare register. Two folding wood seats in the baggage compartment may be occupied when necessary. The double-end car has the same seating capacity in the smoking compartment as the single-end car, but seats 36 in the passenger compartment, making a total of 52. Seats are spaced 34 in. apart to insure adequate knee room.

Interior illumination is provided with six dome lights in the passenger compartments, four in the main compartment and two in the smoker. Each light consists of a 150-watt bulb and a 12-in. bowl. At each of the four corners of the car a light is suspended from the underframe to assist passengers in boarding and alighting and to decrease the number of automobiles running into car steps and tearing them away. These lights also serve as trouble lights under the cars at night. On the front of the single-end cars there is a cowl around the belt rail, in which are located five lights to illuminate the dash at night while passing through city streets.

On each side of the car, extending the full length of the main and smoking compartments, is an aluminum truss plank housing, the front of which forms a support

GENERAL DIMENSIONS OF C., H. & D. INTERURBAN CARS

GENERAL SPECIFICATIONS OF C., H. & D. INTERURBAN CARS

Builder of body	G. C. Kuhlman Car Company
Type of car	7 single-end combination passenger and baggage; 3 double-end passenger
Air brakes	Westinghouse type AMM
Bumpers	Rico anti-climbers
Car signals	Westinghouse 8-T air signal
Trimmings	Statuary bronze
Center and side bearings	Brill-Stucki
Conduits	Duratube
Control	Westinghouse HLF.
Couplers	Tomlinson automatic
Curtain fixtures	Curtain Supply No. 88
Curtain material	Pantasote
Destination sign	Hunter
Gears and pinions	Nuttall
Hand brakes	Peacock staffless
Heaters	Consolidated panel type
Headlights	Crouse-Hinds DCP
Journal boxes	Brill semi-steel
Lightning arresters	Westinghouse electrolytic
Motors	Four Westinghouse 535-A-1
Motor mounting	Inside
Paint	Duco
Registers	National Cash Register ticket
Sanders	Nichols-Lintern
Sash fixtures	Brill lockless
Seats	Hale & Kilburn
Seating material	Leather
Trolley retrievers	Ohio Brass
Trolley base	Ohio Brass
Trolley wheels	More-Jones
Trucks	Brill 77-E-2
Ventilators	Brill exhaust
Wheels	28-in. rolled steel
Floor covering	U. S. rubber tile
Headlining	Agasote
Interior finish	Haskelite mahogany
Power-saving device	Economy meter

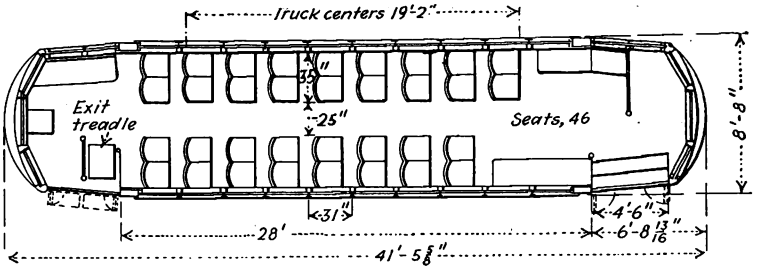
for 28 panel type single-coil, 500-watt Consolidated Car Heating Company heaters in the single-end car and 30 in the double-end unit. The heaters are wired five in series and are under control of a thermostat which may be by-passed when going over track switches by means of a tumbler switch provided for the purpose.

Motors and control were supplied by the Westinghouse Electric & Manufacturing Company. The motor is type 535-A3, 60 hp., geared 21:51 on 28-in. wheels and arranged for field control. The special requirements of the Cincinnati, Hamilton & Dayton Railway made necessary the application of a motor that could be used with small wheels and at the same time have sufficient capacity to operate the cars in either limited or local service. On level tangent track and with 600 volts at the trolley the cars will balance at approximately 54 m.p.h. The control is electro-pneumatic type HLF. The cars may be controlled from either end and provision has been made for train operation. Type M edgewise wound alloy resistors have been used. They weigh 72 lb. per car, whereas if grids had been used the weight would have been 345 lb.



Dayton city cars seat 46 and weigh 33,400 lb. complete. They are arranged for single-end operation with an automatic treadle exit at the rear.

City Losses Changed to Profit

As in the case of the interurban cars, attractiveness and passenger comfort were sought in the design of the ten double-truck, single-end, one-man, two-man cars for service in the city of Dayton and between Dayton and Miamisburg, built by the Cincinnati Car Company. They are equipped with Hale & Kilburn double bucket cross seats upholstered in genuine leather and of special deep spring design. An inside step well at the front end permits easy access to the car and an automatic treadle-operated rear exit prevents crowding and congestion in the interior. The cars are only 10 ft. 5 11/16 in. high from rail over trolley boards. This, combined with the accentuation of streamlines in the body, gives the vehicle a rakish and attractive appearance.

After only a comparatively short period of operation, the increased attractiveness of the service afforded by these cars resulted in a 13½ per cent increase in revenue and at the same time a decrease of 38.10 per cent in operating expenses. This covered a period from May 8 to June 18, in comparison with a similar period immediately preceding the installation of the new cars. It is interesting to note that the increased riding occurred at a time when there is usually a drooping curve of passenger earnings. The full significance of the effect of the equipment on revenues is brought out by a comparison with the same period of last year. On this basis there was an increase of approximately 20 per cent in revenue. The net result of increased revenue and decreased cost gives a substantial net income for the Dayton city operations, whereas this part of the company's business showed red ink during the period immediately preceding the installation of the new cars. Details of revenue and expenses are shown in a tabulation on the next page.

These cars are 41 ft. 5⅝ in. long over all, 8 ft. 8 in. wide and have a seating capacity of 46. They weigh 33,400 lb. complete. Exterior paint is Duco in all-over brilliant Tuscan red, the same as the interurban passenger equipment. The interior trimming is cherry stained mahogany. Dome lights down the center of the car provide comfortable illumination without glare. Air piping and the hand brake staff in the front vestibule are inclosed in a neat cabinet. Back of the operator a steel partition incloses a large glass window, which, while permitting passengers a clear view ahead, cuts the operator off from passengers in the body and provides a support for a roller shade to protect the operator from the body lights at night. Around the vestibule belt rail a pressed steel hood incloses five incandescent lights which illuminate the front dash. An automobile type bumper extending down below the dash tends to give the front end a finished appearance.

GENERAL DIMENSIONS OF C., H. & D. CARS FOR DAYTON CITY SERVICE

Length over all	41 ft. 5⅝ in.
Length over dashes	40 ft. 6½ in.
Length over body	28 ft. 0 in.
Length of platform over dash	6 ft. 3 7/16 in.
Height from rail over trolley boards	10 ft. 5 11/16 in.
Height from floor to headlining	7 ft. 3 in.
Extreme width	8 ft. 8 in.
Width at side sill	8 ft. 6 in.
Height rail to first step front end	11 in.
Height first step to second step front	10½ in.
Second step to car floor front end	10½ in.
Rail to step rear end	16 in.
Step to car floor rear end	13 in.

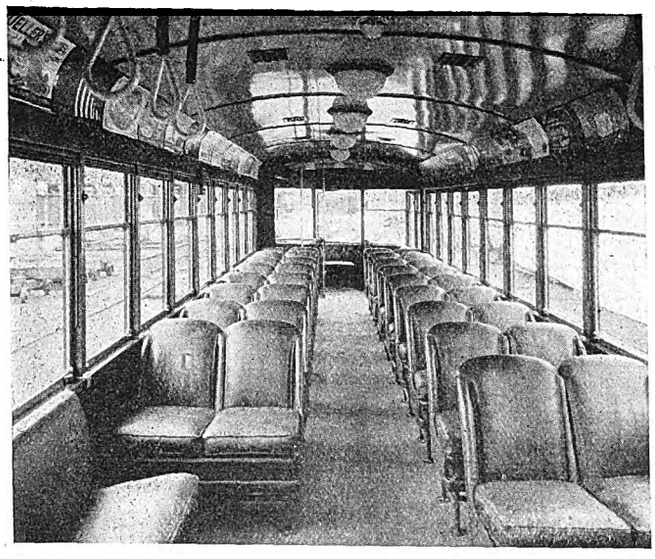
General dimensions and specifications of the cars are given in accompanying tabulations. The side sills of the underframe extend the full length of the car body on the open side and between vestibule corner posts on the closed side. The cross sills are 3-in., 6.15-lb. channels riveted under the side sills with angle clips. This same section of material forms the body end sills. The open side of each vestibule is supported by a built-up knee formed of No. 10 gage steel plate pressed to shape to support the platform load. The body bolsters are of built-up riveted box girder type. The inside is filled with ground cork and cement to deaden sound.

Side girder plates are No. 14 Armco iron, reinforced at the top with a No. 12 pressed steel belt rail channel, full length of the body side. The body framing is stiffened at each corner with a pressed box shaped pier post formed of No. 12 Armco iron and extending from the bottom of the side sill to the top of the letterboard, the inside edges of the piers being connected together by steel straps riveted in place. The car body side posts are short wood posts extending from the letterboard to the belt rail, bolted to the letterboard and carline shoes and to the belt rail with joint bolts through the cast aluminum shoes.

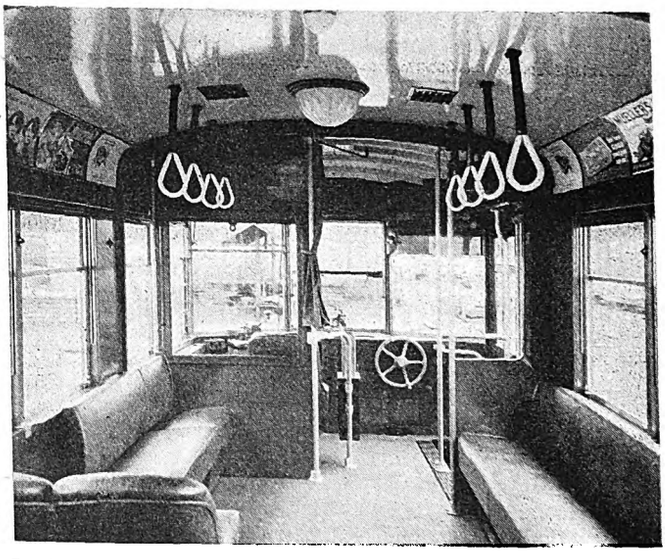
Double folding doors are provided at both the front and rear ends of the car. Control of the front doors is through a selector valve attached to the M-28 brake valve. The rear pair of rear doors may be operated either by a conductor from the interior or by a street fare collector through an outside valve provided for the purpose. The front pair of rear doors is under the control of the automatic exit treadle under the direction of the car operator on the front platform.

Panel type Consolidated open coil heaters are installed in the face of a pressed steel seat support along each side of the car. In the bottom of the steel duct thus formed an insulated conduit box is formed for power wiring. On the top of the motorman's control cabinet an auxiliary tumbler switch, as in the case of the interurban cars, is provided for short circuiting the thermostat when coasting under electric track switch contacts.

The cars are mounted on Brill No. 177-E-1-X trucks and are equipped with four G.E.-265, 35-hp. motors and K-75 control.



Comfortable leather-upholstered seats, a wide aisle and general appearance of the Dayton city cars have attracted substantial increased patronage



Looking forward from interior of Dayton city car. A steel panel with large sash back of operator cuts him off from passengers, but permits them a forward view

Newspaper Commends the Toronto Railway System

IN A recent issue of the *Coupler*, the magazine issued monthly by the Toronto Transportation Commission, Toronto, Canada, an editorial is included on "The Proof of the Pudding." This sets forth some of the advantages that the citizens of Toronto have derived from the rerouting of the street railway system that was inaugurated in 1923. According to the statement, the rerouting "has effected economies and more efficient operation by doing away with needless duplication." Of the benefits now derived by passengers, it is stated, "from figures submitted by the traffic study department, which were taken from the actual counts of the individual trainmen, the rerouting which has been done is saving the passengers the trouble of making 4,600,000 transfers yearly."

It is not without cause that the Toronto Transportation Commission is jubilant over the success that has attended its efforts in this direction. Few of the traveling public will deny the vast improvement that has resulted generally in street car transportation since the commission took over the service. The Toronto Transportation Commission has given the city a splendid service, one of the finest, we believe, in the world.—*Toronto Globe.*

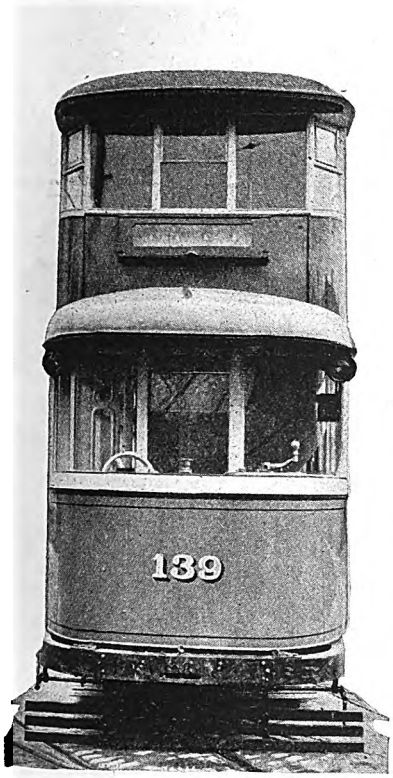
London Company Tries

Two New Types of Steel Cars

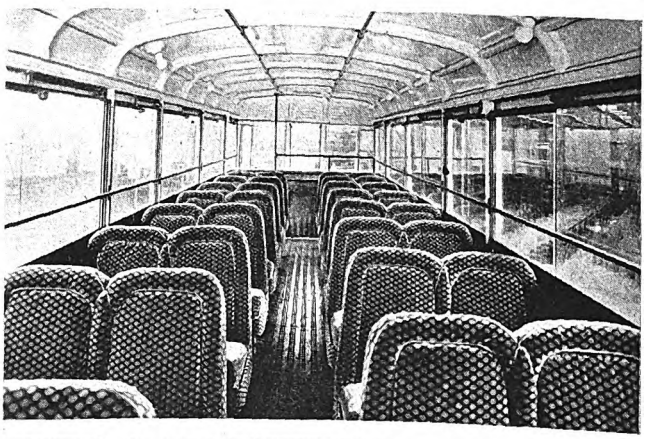


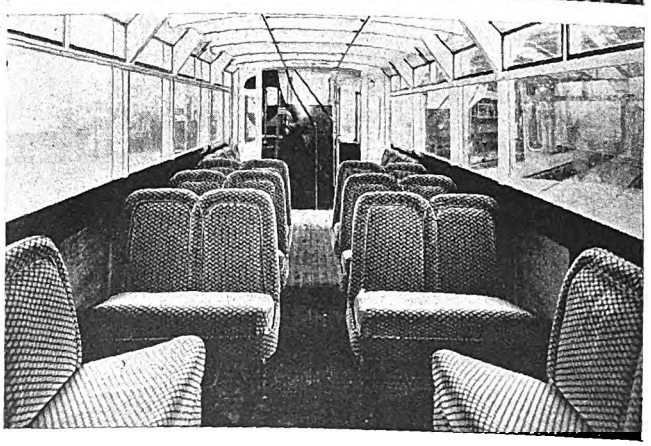
CARS of two new types have just been put in service on the Metropolitan Electric Tramways, one of the electric railway lines in the western part of London associated with the Underground group. An especially interesting feature of these cars is that one was designed by the officials of the company to represent their ideas of what a car should be. The other was designed by the officials of the associated London General Omnibus Company to embody their ideas of street railway car design. The former is painted blue and is popularly called the "Bluebell." The latter is painted red and is known as the "Poppy." The accompanying illustrations show both cars.

The body of the Bluebell is of light-weight construction, composed chiefly of 16-gage high tensile steel channel filled with wood (ash), the bottom cross members being of oak with main side members of pressed high tensile strength steel. Every pillar is attached at its lower end to the underframe and at its upper end to the roof member by a steel bracket. The platforms are level with the car floor, only the driver's compartment being at a lower level.

Balanced sash are used on the upper deck. On the lower deck ventilation is provided by a row of narrow upper sash that swing inwardly. The interiors of both decks have been designed as free as possible from corners which would be liable to collect dirt. Stainless steel is used for all hand railing and hand grip stanchions.

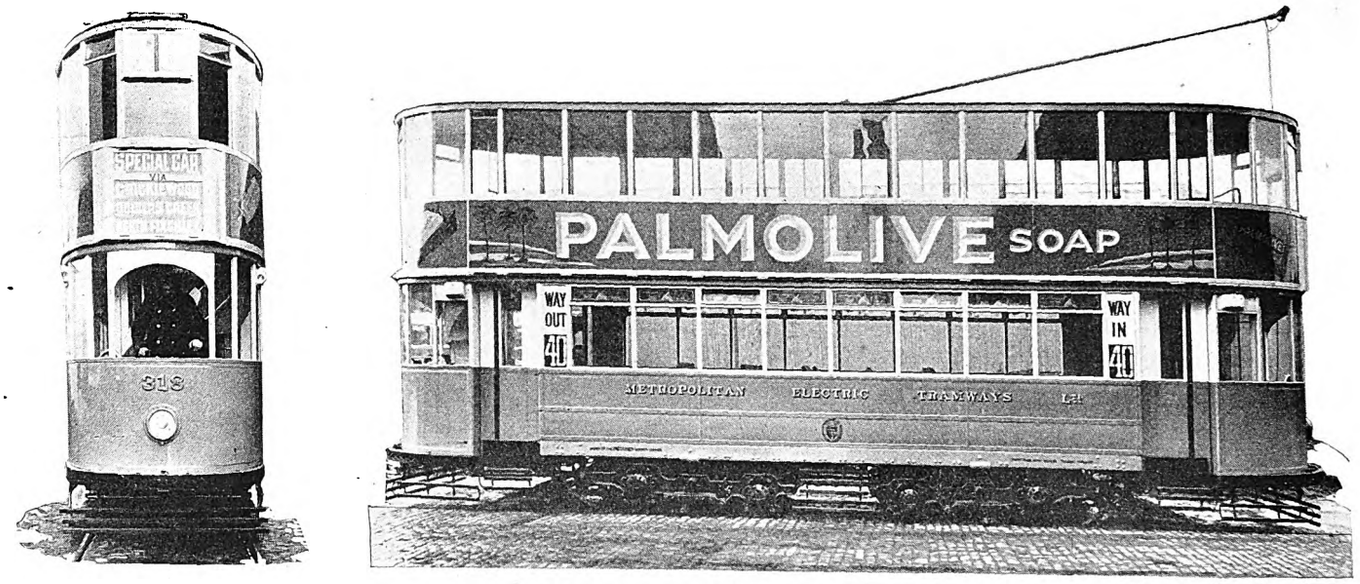
The seats on both decks are upholstered, those on the lower deck with moquette, those on the top deck with leather substitute. As with other London cars, the lower



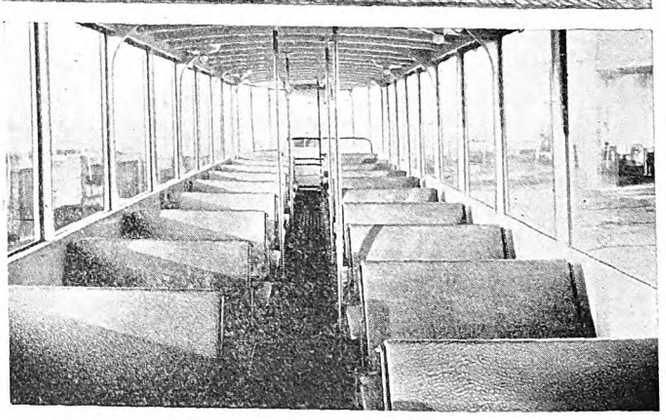


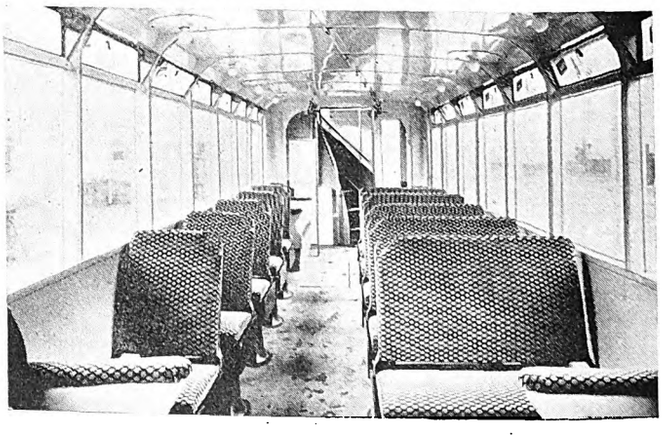
A London tramway company is trying two new types of cars. This one, known as the "Poppy," was designed for London service by engineers of the London General Omnibus Company

Digitized by Google



The "Bluebell" was designed by the tramway's engineers and recognizes the circulatory principle of the passenger load of the London General Omnibus Company





deck is somewhat narrower than the upper as it is considered necessary to provide room between passing cars for a man to stand. Hence the lower deck seats only three passengers across the car, while the upper deck seats four. The seats are of the usual reversible type.

The flooring on the lower deck is of gray rubber, on the upper deck of slats.

Air brakes acting on both track and wheels are used, with emergency cocks at each end of the car for application of brakes by conductor or passengers in case of need. The brakes are interlocked with pneumatic sanders which apply sand immediately in front of the leading wheels. There are also hand brakes.

The trucks are maximum traction, with 28-in. and 31¾-in. wheels. The car journal boxes are equipped with roller bearings and the armature shafts with ball or roller bearings. There are two motors of 50 hp. each, weighing 35 lb. per rated horsepower, as compared with 56 lb. for the older motors. The specifications for these motors call for 30 m.p.h. for the car on the level, 15 m.p.h. on a grade of 5 per cent and schedule speed of 12 m.p.h. with four stops per mile of ten seconds each.

The car is one of the few in Europe with fully inclosed and separate entrance and exit and passengers are urged to enter by the rear and leave by the front platform. The platforms are flush with the body of the car. Folding steps interlock with the doors.

On the Poppy the brakes, sand boxes and trucks are the same as on the Bluebell. The motors are also practically identical, except that they are of different make and the controller is operated by a camshaft. The platforms are quite different, as only the rear platform is designed for entrance and exit. The motorman is shut away from the rest of the car, though there is a small doorway at the front end for use by passengers in emergency. The step on the rear platform has a double-fold motion; that is, as the door is closed the step tread rises to a vertical position, then it, with the riser, swings to a horizontal position to fill up the opening in the platform.

The body construction of the Poppy is on the same principle as used in the London buses. The two main side sills, which are deep section steel channels, extend from buffer to buffer, but are bent inwardly toward the end of the car and strengthened at the bends by thick steel plates. The side posts are of ash, flitched with steel and bracketed to cross members as in bus construc-

Total carrying capacity, including standing	105	80	85

Digitized by Google

tion, the two corner posts at each end being strongly braced together for longitudinal strength. The roof of the upper deck is of beaten aluminum sheet, suitably strengthened wherever necessary for the trolley plank. Railings and grab handles are of black vulcanite covered metal and a light natural wood finish is used for the car interior.

Moquette upholstery is used for all seats, those on the lower deck saloon being partly cross and partly longitudinal, but the method of reversal on both decks is different than in the Bluebell. Two adjoining cross seats are jointed and pivoted at the center so that they swing around. Each seat back has been designed with special springs, so arranged that the central portion is more easily compressed than the outside edge. This tends to reduce discomfort to passengers when the car passes around curves.

Both cars are double ended.

A few words here about the Metropolitan Electric Tramways and its associated companies, the London United Tramways and the South Metropolitan Electric Tramways & Lighting Company, may not be inappropriate. They are in the northern and western sections of the London district and operate about 600 double-deck cars. The average speed (obtained by dividing the car-miles by the car-hours) is between 9½ and 10 m.p.h. Though not in the center of London, these lines encounter considerable street congestion, as a great many of the streets on which there is a double track are only 32 ft. between curb lines. The fare basis is a penny a mile, and as the average fare is 1½d (3 cents) the average ride can be considered as 1½ miles or slightly less.

Besides the construction of these cars, the company has recently re-equipped about 70 of its older cars with high-speed motors, moquette upholstered cross seats, better lighting, etc. It has also built an experimental two-car train with one double-deck and one single-deck car, both equipped with motors and air brakes. The latter equipment is unusual in London, where the magnetic brake has been the rule, but air brakes were thought better for train operation. Another trial the company is to make is with the bow trolley, which will be installed on one of its principal lines, as some trouble has been experienced in the past from trolley wheels becoming detached and falling on passengers.

Milwaukee's Year Book of Accomplishments

UNUSUAL activity in the utility field is told of by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., in a 50-page year book of convincing text, informative maps, illuminating charts and ingenious arrangement of reproductions of pen and ink sketches. Within its pages the company describes its enterprises and accomplishments of the past year. A cursory glance at the pages devoted to the educational department are enough to make one feel that "the trained man wins" and the picture of the operating room of the medical department inspires confidence by the completeness of its facilities. In a foreword President S. B. Way says the purpose of the book is to provide the public with a more intimate knowledge of the properties, operations and services. It will add to the fund of information acquired by public visitors through the ceremony of Open House Week, beginning Nov. 8.

Paying Trainmen by Check Successful

MARKED success has attended the first year's operation of a plan to pay all employees of the Public Service Railway, Newark, N. J., by check instead of by cash. This method of paying employees was instituted in July, 1926, shortly after the wanton killing of a paymaster in an unsuccessful attempt at robbery. For some time previous the scheme had been under consideration, but this unfortunate event convinced both the railway officials and the employees of the need for check payment and hastened the establishment of the present method.

A simple and effective procedure has been adopted for the payment of trainmen. Time sheets are made out at the various carhouses in the same manner as before and sent to the auditor's office, where the payrolls are prepared. The latter differs somewhat from that formerly used. Addressograph plates giving the man's name, address and payroll symbol have been prepared. The symbol consists of the letter "R," denoting that it is a railway payroll and a number indicating the day of the week when the wages are paid at the particular carhouse for which it is being prepared. This information appears in a column at the left of the payroll sheet. To the right of the man's name are entered his working time for the week, wages, deduction for insurance, deduction for purchases of the company stock and at the right the amount actually due.

From the auditor's office the payroll is sent to the addressograph department, where checks are made out. A special check form is used. The procedure consists of three operations. The first is the placing of the man's name, etc., on the check by means of the addressograph already mentioned. The second operation is the entering of the amount. Finally the signature of the treasurer is inserted with the aid of a check-writing machine. Preparation of checks is accomplished at a rate slightly faster than one per minute.

The checks are then taken by the paymaster to the carhouse. He carries with him only a nominal amount of cash and does not require the protection formerly afforded by an armored pay car. This used to be necessary because payrolls frequently total more than $10,000 for the larger carhouses employing 250 to 300 men, averaging $35 to $40 per week. Under the present plan he travels by automobile unaccompanied yet in entire safety.

At the carhouses the men present their time slips and receive their checks. The checks are cashed by the receiver at the carhouse up to the extent of the funds available. They can be cashed also at the commercial offices of the Public Service Electric & Gas Company. Another method of disposal is for the trainman to turn in his check as part of the day's receipts. The practicability of this last method, however, is limited because not all runs take in sufficient money to cover the amount of the check. Banks will cash trainmen's checks for the individual named thereon provided he is known, but will not cash them for other people. They are acceptable for deposits, however, to the credit of any one. Hence storekeepers do not hesitate to accommodate the trainmen by cashing their checks.

Experience shows that paying the trainmen by check is more rapid than paying by cash. No serious difficul-

Digitized by Google

ties have arisen during the last year in connection with this plan and the men are well satisfied with it. Among the 4,000 bus and car operators, a surprising number have checking accounts at various banks. It is believed that the new system has to some extent encouraged this practice.

Payment by check introduced a legal complication at first. Under the New Jersey law it is required that all workers be paid by their employers in cash. Officials of the company discussed this matter with the State Department of Labor, however, and it was agreed that no objection would be raised against the present plan on account of its obvious advantages from the standpoint of safety.

No Deterioration in 23-Year-Old Anchor Plates

By S. L. Foster
Superintendent of Overhead Lines Market Street Railway San Francisco, Cal.

HOLDING the corner poles of a transmission line rigidly, safely and permanently may be only a detail of construction, but it is a very essential one. Eighty-three years ago, when Morse invented the electric telegraph and the first pole line in this country was built to support the wire between Washington and Baltimore, the constructor of this line probably invented the wood log for an anchor for his corner poles. Today the cumbersome log anchor is still used by many. It has been improved in durability by replacing the black iron rod with a hot dip galvanized iron one and by treating the wood log with a preservative. It still has serious defects, besides requiring great excavation when installed.

The continuous strain of the guy, concentrated as it is on the small surface of the wood log under the nut of the rod, results in the nut being forced into the wood. The effect of this creepage of the rod is multiplied in an amazing ratio, depending on the height of the pole guyed and the distance the anchor is from the base of the pole. The additional sag thrown into the conductors at the tops of the poles adjacent to the guyed corner often spoils the looks of the transmission line and is never fully remedied afterward.

If a dead-end pole is assumed to be 50 ft. high, the anchor set 20 ft. from the pole, the span nearest the pole 120 ft. long and the original sag in this span of conductors 12 in., the top of the pole will go over 1.25 in. if the anchor rod is drawn ½ in. into the log. The 12-in. sag in the conductors will be increased to about 29 in.

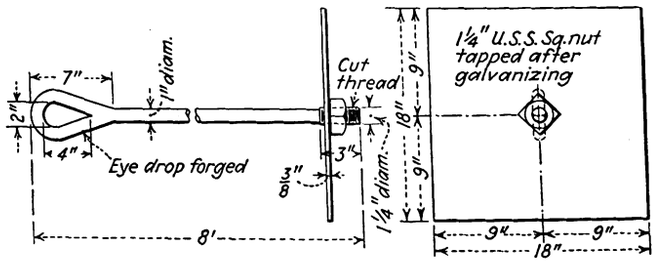
Before the galvanized rod or creosoted log appeared the writer condemned the wood log anchor for use on street railway heavy curve trolley and feeder cable strains as being extravagant in first installation cost, of indefinite useful life, subject to progressive rod creepage from gradual sinking of the nut of the anchor rod into the wood and of no ultimate salvage value. The substitute adopted was a ⅜-in. thick 18-in. square galvanized iron plate with a central hole for a 1-in. galvanized iron rod 8 ft. long and upset to 1¼ in. for 3 in. before threading at the lower end and providing an oval welded eye at the upper end.

This unit gave 2¼ sq.ft. of flat unyielding surface to resist the upward pull. The plate was made square, as more surface can be obtained from a stock plate for a dollar in square shapes than in round on account of the waste in cutting out round shapes.

The upsetting of the rod at the lower end to 1¼ in. diameter before threading was to obtain the same cross-section of metal at the base of the thread as existed elsewhere on the rod. When a 1-in. rod is cut by the die its cross-section is reduced by 30 per cent. The cross-section at the base of the thread on a 1¼-in. rod is practically the same as on an unthreaded 1-in. rod.

From tests it was calculated that such a plate would resist a pull of 33,000 lb. when buried 7 ft. in firm soil. The 1-in. rod at 50,000 lb. per square inch ultimate strength for wrought iron would sustain a safe pull of 20,000 lb. with a factor of safety of 2. As the breaking strength of ½-in. seven-strand galvanized steel cable is 10,000 lb. this plate would withstand a strain that would break off two ½-in. steel guy cables. There would be no creepage of the rod and whenever this anchor was dispensed with the galvanized plate and rod could be dug out cheaply as good as new and used elsewhere. When installing, only the digging of an 18-in. square hole was required.

When the Market Street Railway built its Cliff Line in 1904 out by the Golden Gate and facing the destructive fogs and salt spray of the Pacific Ocean this form of galvanized anchor plate was used. Due to extensive landslides, this car line was recently abandoned and these anchors were dug out. All of them were found to be practically as good as new and were taken into stock at full value and will be used elsewhere as needed. No wood log anchor installed 23 years ago would have been worth digging out.



Anchor rod and plate as used by the Market Street Railway

Today this unit of anchor plate and rod costs $3.50. It costs about $2.50 to install. It cost about $1.75 each to dig out on this relatively inaccessible location where the digging tools and anchors had to be carried long distances by the men. None of this type of anchor has ever pulled out or failed in any way.

In this locality a wood log anchor with a maximum strength of 20,000 lb. would cost about $32 to install.

After 25 years practical experience with this form of guy anchor it is felt more than ever that the wood log form has none of the advantages possessed by the galvanized iron plate, such as low cost, decreased excavation, stability, durability and salvage value.

There have been many forms of guy anchors invented for light and medium strains, but for strains of the order of 20,000 lb. nothing has come to the writer's attention equal to our simple, unyielding, 18-in. square foolproof iron plate.

For heavier strains and more than one guy a larger plate and an additional rod naturally suggest themselves. Boulders or old paving blocks placed above the plate and thorough tamping of the backfill will enlarge the scope of the anchor and increase its resistance.

Making Records with the Camera

Toronto Transportation Commission has well-organized photographic department which makes pictures of all important happenings on the system, as well as preparing blueprints and other reproductions

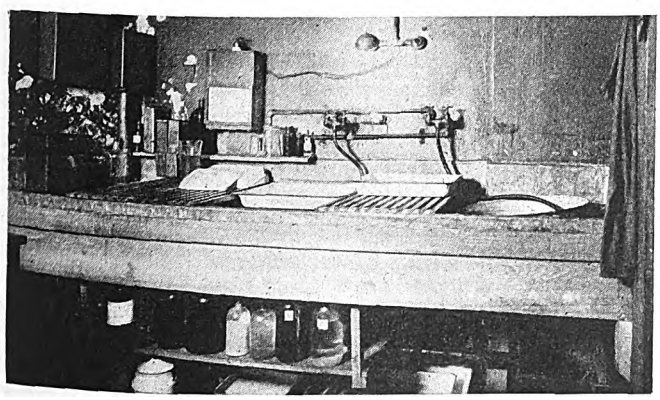
PHOTOGRAPHY has been called to the aid of the Toronto Transportation Commission, Toronto, Canada, to a greater extent than on the average American railway. A special department has been organized to serve all the departments of the system by taking photographs depicting any situation which it is deemed desirable to show permanently. In this way a most valuable record has been built up which has been used to advantage on many occasions.

One of the regular assignments of the department is to take pictures showing damage sustained in accidents. All cars, buses or other equipment involved are photographed. Damaged automobiles or wagons are also taken, as well as pictures that show the appearance of the roadway at the scene of the accident. It has been found that illustrations showing the streaks of rubber worn off from skidding tires are definite proof of the speed and direction of approach of the vehicle.

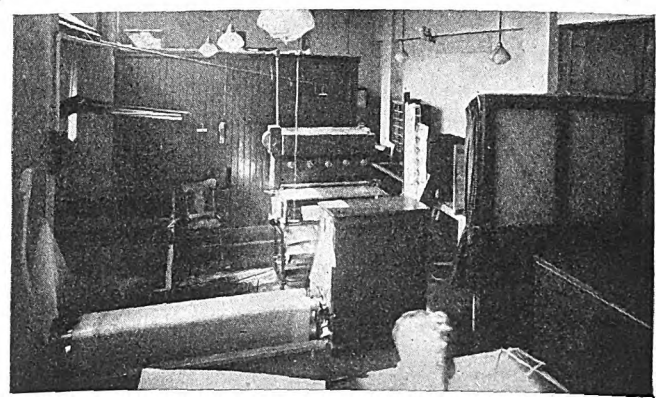
Another regular use of photographs is in connection with construction work. The usual progress pictures are always taken. A use of photographs that is not so common is to show the conditions that existed prior to any blasting or extensive destruction of property necessitated by construction. All trees that are to be removed are photographed, as are trees that are to undergo extensive trimming.

In connection with the ordering of replacement parts, photographs of defective or broken pieces are often taken. It has been found agreeable in numerous instances to send the photograph to the manufacturer instead of the part itself, thus getting an equally good adjustment without the cost and delay incident to boxing the piece and shipping it.

Photographs of streets are made to show the wear of paving and rail. These are taken periodically and are valuable evidence if any dispute arises with the city as to the cause of deterioration. Close-up views of worn rail and of all special work are likewise standard. In



The dark room sink is lead lined and is fitted with both hot and cold water service. Racks are used for supporting the developing trays



A view of the blueprint room. At the rear is the photographic dark room, while at the center right can be seen the 14x17 copying camera and the lamp used for illumination

Digitized by Google

connection with the tests being made on the Sandberg sorbitic process of rail hardening, a series of views is being taken every three months. These are making a valuable record that will be available permanently.

A considerable amount of work is done in connection with publicity material. Points of interest in Toronto and vicinity that are reached by the commission's cars and coaches make an attractive appeal to the public. A rather unusual series of photographs was made of specimens in the city museum. A record is made of any public event in which the commission is interested, such as ceremonies in connection with the opening of new lines. Views showing vehicle parking and congestion effectively bring home to the public the evils of too much traffic on the streets.

Pictures have been taken in a number of instances to show the manner in which the commission has beautified the grounds in the vicinity of carhouses and other structures, making it evident that the buildings are not eyesores.

Photographs are taken of every type of car, bus or coach. These show both interior and exterior. Any important changes in the vehicles are also recorded in similar manner. Special photographs of coaches have been taken for color matching at the factory. The photographs are not colored, but on them are indicated the exact portions of the body which are to be finished in a desired shade. Such marked photographs, sent to the factory, have made it a simple matter to duplicate the appearance of existing equipment.

Another activity of the photographic department is the production of lantern slides for lectures of the various officials. These lectures have been instrumental in the publicity department's work of building up good will. The activities of the railway as depicted have brought out many favorable comments.

Besides this original photographic work, the department makes copies of drawings, photostats, and in fact any material that it is desirable to reproduce. Blueprints, blue-line prints, Vandykes and oxalid prints are also made in quantity.

All work done by the department is made at the request of the department head interested. Order forms are numbered serially and are made out in triplicate. Separate forms, as shown in the accompanying illustrations, are used for photographic work and line prints. The three copies of each are identical except for color. The original of the photograph order is white, the duplicate pink and the triplicate blue; while for blueprints the original is blue, the duplicate white and the triplicate yellow.

Orders for photographic work or blueprints are made out in triplicate on the forms shown, which are 5x8 in.

The original and the duplicate are sent with the order, while the triplicate is retained in the files of the department making the request. When the work is completed the original is receipted by the departments ordering and the duplicate is returned with the package.

The department is on a self-sustaining basis, the other departments being charged a rate which is considerably less than that charged by commercial photographers. For instance, $1 is the price for each negative, with an additional charge of $1 per hour for time of the photographer in the field. A charge of 25 cents for each 5x8-in. print is made. Blueprinting and other work of like character is charged on a similar basis.

Equipment of Laboratory

The department has standardized on 5x7-in. negatives for all photographs. When larger or smaller prints are wanted they are made with an enlarging camera. The regular equipment consists of a 5x7-in. view camera equipped with a No. 9 Zeiss Protar convertible lens of 7-in. focus mounted in a compound shutter, and a 5x7 Graflex press camera, using the Protar cells only in an extra barrel. The press camera is built to accommodate an 8½-in. lens, so that the flange must be set back as far as it can be without interfering with the action of the mirror.

For reproduction work there is a 14x17-in. copying camera fitted with a 16½-in. Cooke process lens. It has a prism for reversing and a set of filters for color screen work. Light is supplied to the copy board by two upright batteries of nitrogen lamps, each mounted on a movable stand. Enlargements and reductions from negatives are made with an 8x10 revolving back enlarger fitted with an extension for the accommodation of the 16½-in. Cooke process lens. This makes all the en-

Digitized by Google

OUTPUT OF PHOTOGRAPHIC DEPARTMENT, TORONTO TRANSPORTATION COMMISSION, JAN. 2 TO MAY 31, 1927

Printing Work	Sq.Ft.	Photographic Work	Number
Blueprints	20,355	Plates, 5x7	270
Blue-line prints	2,738	Films, 14x17	2
Ozalid prints	2,862	Prints, 5x8	810
Vandykes	620	Lantern slides	50
Black-line prints	25	Progress charts	81
White linen prints	142	Enlargments (up to 24x36)	150
Blue linen prints	60	Reductions	50

largements, up to a maximum of 26x42 in. For reduction, as in making lantern slides, the Protar lens used in the view and Graflex cameras are employed. Illumination is furnished by a Cooper-Hewitt mercury vapor lamp.

In addition to the standard cameras, the department has a 10-in. Folmer & Schwing panoramic camera, made by the Eastman Kodak Company.

The laboratory equipment includes a 4-ft. printing frame with a battery of lights in a printing box. This is installed in the dark room, as shown in one of the illustrations. The greater portion of the contact printing, however, is done on a printing table installed in the dark room. The light box is 11x14, with an aperture below the glass to allow for dodging. Adjacent to the printing table is a lead-lined sink of ample capacity to accommodate the largest prints handled. A complete assortment of trays from 5x7-in. to 38x42-in. is included.

For the production of blueprints and other line work, there is a 42-in. Revolute Blue Streak printing machine, rated at 250 volts, 100 amp., and having four arcs. There is also a Revolute drying machine, rated 250 volts and 60 amp.; an ammonia developing tank, a washing tank and a potash tank.

An indication of the amount of work handled may be gained from the table in the opposite column.

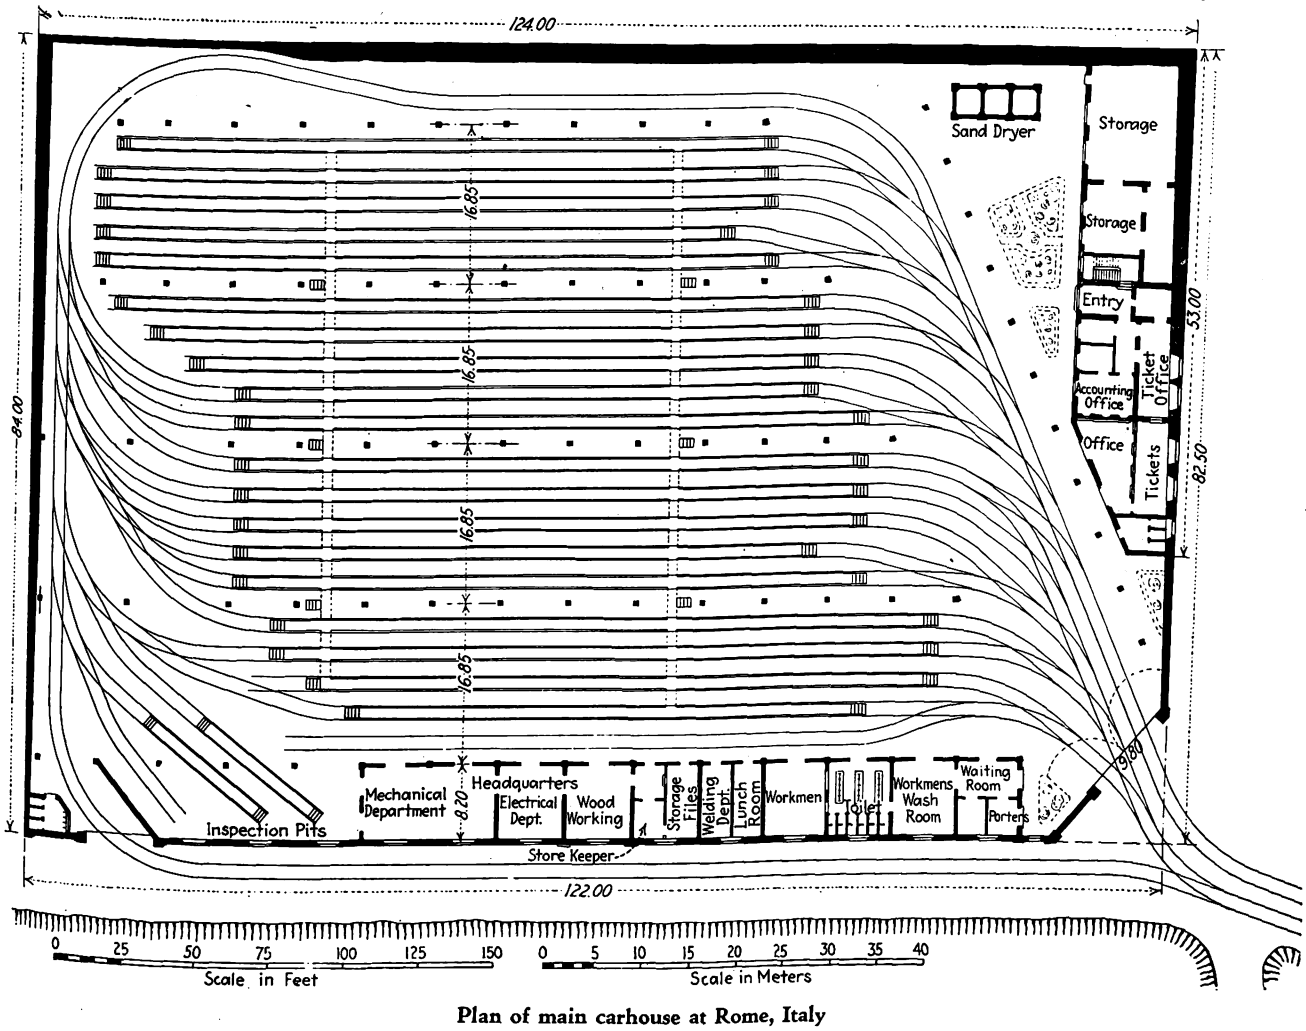
Each negative is titled by the use of a Vandyke negative made from a typewritten slip. This is pasted to the negative so that the title is printed with black letters below the picture. The reason for making 5x8 prints from 5x7 negatives is to provide an inch at the left for binding, as the prints are normally kept in covers.

A rule of the department is that a duplicate print from each negative is filed in the library of the commission. These prints are filed by subjects, so that pictures may be found readily. The department was started Oct. 15, 1922, and since then about 6,000 negatives have been made. Filed in this manner, the record is becoming more valuable all the time.

Rome Building Large Shops

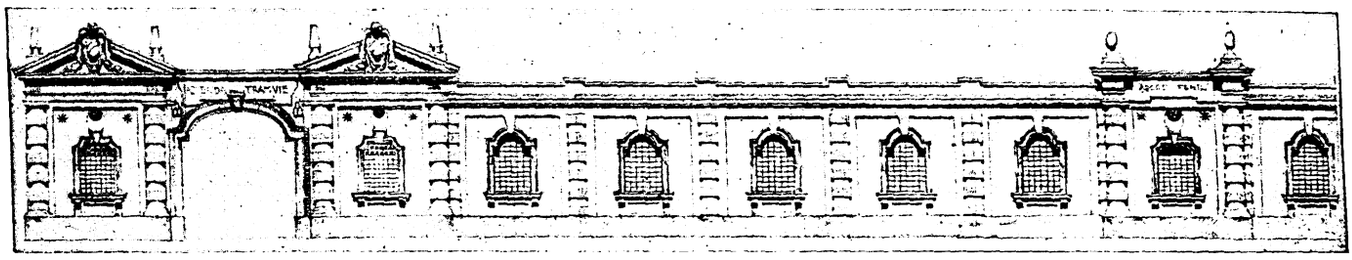
WORK on the construction of some large repair shops has just been begun by the tramway system in Rome, Italy. The traffic on this system is showing a continuous growth and it does not suffer from competition with private automobiles to the same extent as corresponding properties in the United States. This is partly because ownership of automobiles is far less common than in this country and partly on account of the narrow streets in the business district in Rome, which discourage the use of private cars.

The Rome system was fortunate in securing for its new shops a large tract formerly the property of a car



Plan of main carhouse at Rome, Italy

Digitized by Google



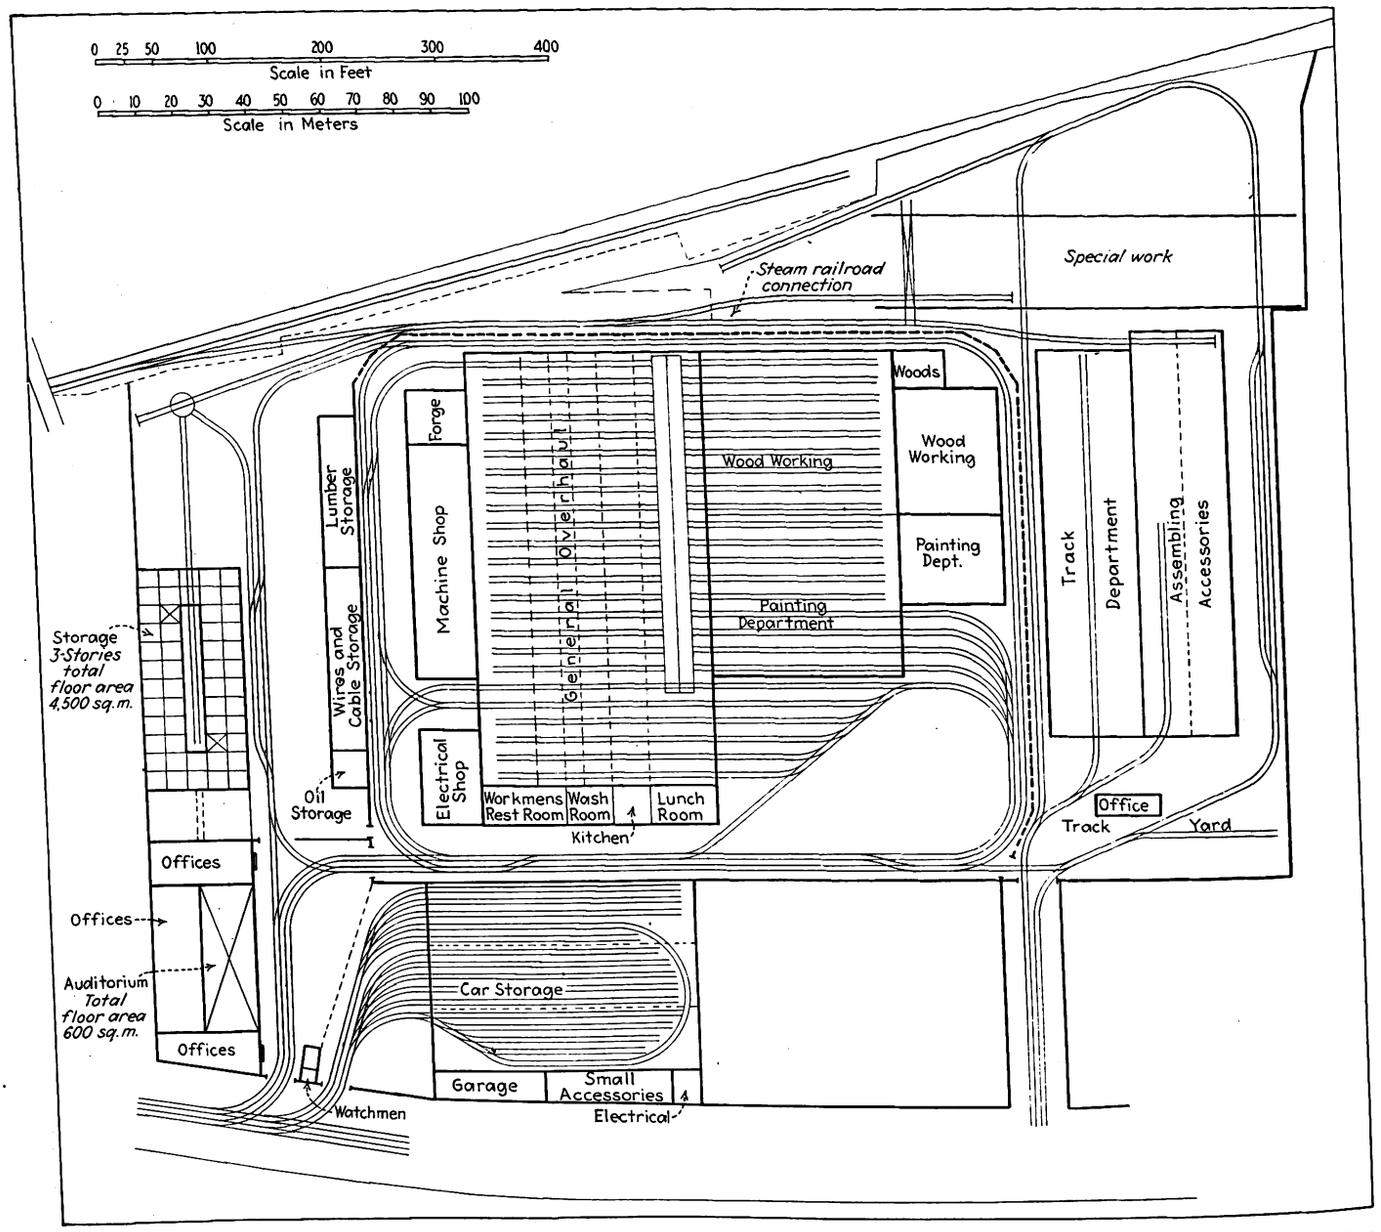
The Italian love of beauty in architecture is shown in the exterior design of the Rome repair shops

building company but now abandoned. While in the suburbs, this plot is not very far from the central loading point of the system. Altogether, the area available for the construction of the new shops is 75,000 square meters, or about 18 acres. Work has been begun here, and it is expected that the new shops will be in use some time in 1928. The cost is estimated at 30,000,000 lire, or about $1,500,000.

As shown in the accompanying plan, it is proposed to consolidate at this point both the repair work for the rolling stock and the yards of the track department.

The shop illustrated is designed for use in general repair and overhaul work only, light repairs, as well as inspection, being carried on at the carhouses. The layout of the main carhouse of the Rome system is shown in the illustration on page 149.

All of the cars now in use are single-truck cars, but some of these cars haul trailers. The trail car mileage in 1925 amounted to about half the motor car mileage, or about 6,513,400 trail car-miles as compared with 13,106,000 motor car-miles. The number of passengers carried during the year was 186,635,463. There are about 670 cars in all and 400 of these are equipped with motors.



New shops to be built by the Rome Municipal Tramway. These shops are now under construction at an expected cost of $1,500,000

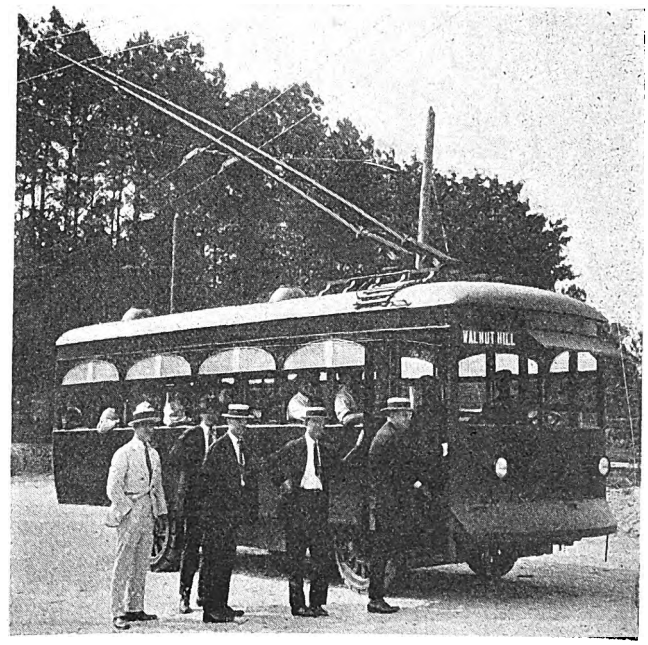
Buses of this type now furnish transportation on the route where trackless trolleys formerly operated in Petersburg, Va.

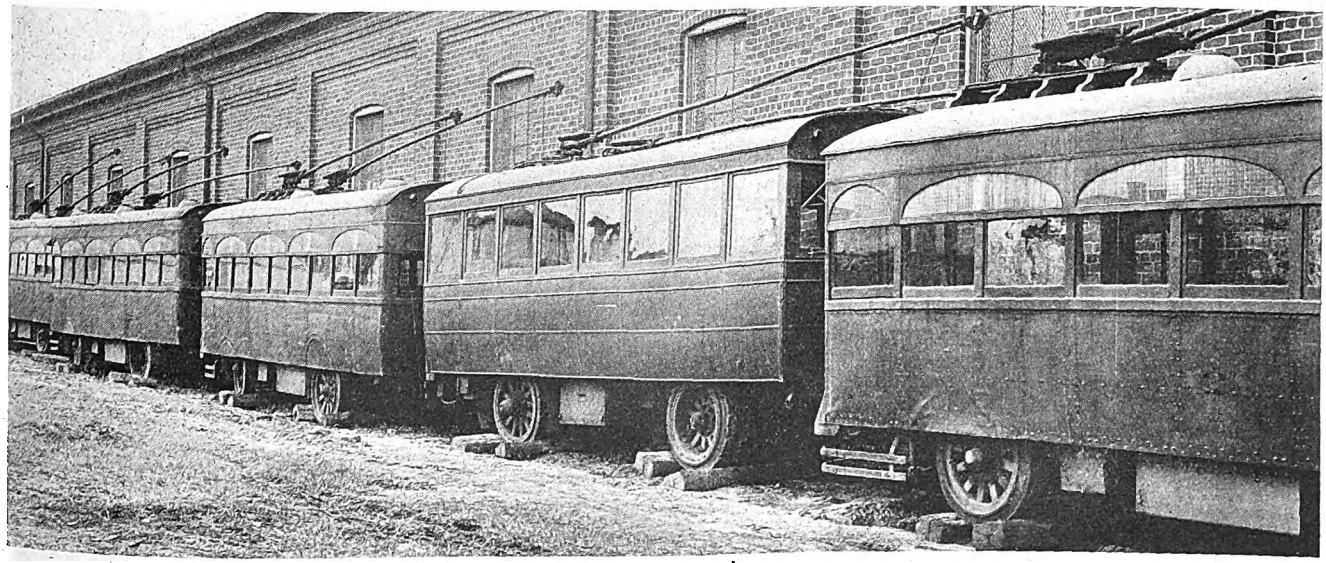
Bus Proves Superior to Trackless Trolley at Petersburg

FOLLOWING six months operation of gasoline motor buses in place of trackless trolleys in Petersburg, the Virginia Electric & Power Company is well satisfied with the new arrangement. The original trackless trolley installation in this district occurred in June, 1923, when an extension was made for a distance of 0.8 mile from the end of the car line in the fine residential suburb of Walnut Hills. Two vehicles were required to provide the service. During the latter part of 1924 the trackless trolley route was extended downtown and rail service between Petersburg and Walnut Hills was discontinued. Under this plan five trackless trolleys were operated on a route 3½ miles long. Rail operation was retained on about 10 miles of other routes in the Petersburg division of the company, then known as the Virginia Railway & Power Company.

The city of Petersburg, however, granted permission to operate trackless trolleys only under conditions that practically precluded any chance of their being success-

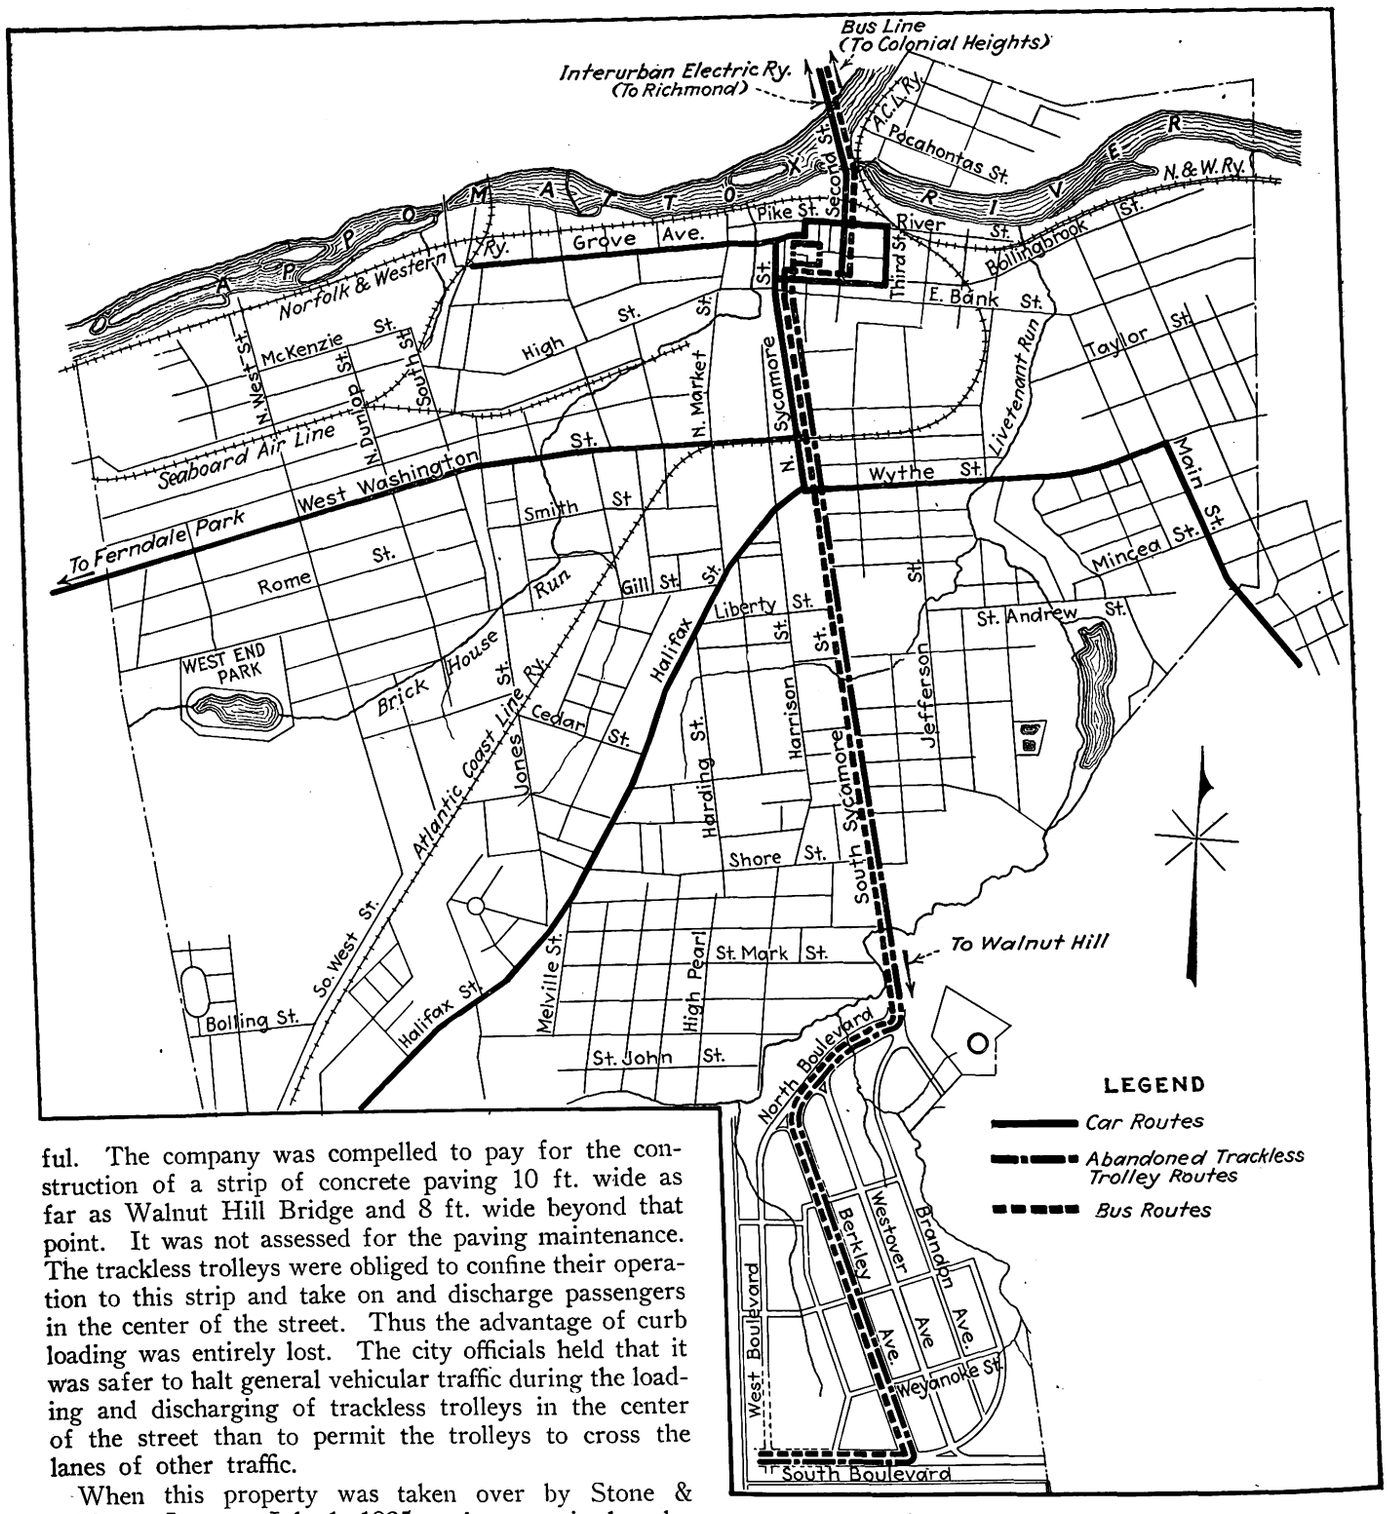


Type of trackless trolley formerly operated



Trackless trolleys laid up after being withdrawn from service in Petersburg, Va., Dec. 31, 1926

Digitized by Google



Transportation in the Petersburg district is now furnished on 10.4 miles of electric railway route and 4.4 miles of bus route, which replaces 3.5 miles of trackless trolley route

ful. The company was compelled to pay for the construction of a strip of concrete paving 10 ft. wide as far as Walnut Hill Bridge and 8 ft. wide beyond that point. It was not assessed for the paving maintenance. The trackless trolleys were obliged to confine their operation to this strip and take on and discharge passengers in the center of the street. Thus the advantage of curb loading was entirely lost. The city officials held that it was safer to halt general vehicular traffic during the loading and discharging of trackless trolleys in the center of the street than to permit the trolleys to cross the lanes of other traffic.

When this property was taken over by Stone & Webster, Inc., on July 1, 1925, and reorganized under the name of the Virginia Electric & Power Company, special efforts were made by the new management to improve public relations. It was apparent that one of the best things the company could do in the Petersburg district would be to eliminate the hard-riding trackless trolleys and take down the double overhead wires, which were disliked by the residents of Walnut Hills.

Operating expenses of the trackless trolleys were as high as those of gasoline buses. Since the former were not in use elsewhere on the property and their equipment was not standard, maintenance costs were high, whereas the gas buses were being used in large numbers in Richmond and their maintenance costs were comparatively low. Hence there was no economic reason to retain the trackless trolleys. They were withdrawn on Dec. 31, 1926, and gasoline buses commenced operation on Jan. 1 this year.

At the same time the route was extended to Colonial Heights, a suburb lying to the north of Petersburg. Route-miles now total 4.4 as compared with 3.5 for the old trackless trolleys. White 21-passenger buses, of the type that are shown in the illustration which appears on page 151 are used. Apparently the public, as well as the Virginia Electric & Power Company, is pleased with the new service.

Before reconstruction the track of Jefferson Avenue, Detroit, was in bad condition

New 7-in., 93-lb. tee rail was laid in 1,500-ft. sections for a total of 2.5 miles of double track

Track Relaid Under Traffic

Reconstruction of 2.5 miles of double track on Jefferson Avenue, Detroit, was done in 1,500-ft. sections by the Department of Street Railways

By Del A. Smith
General Manager Department of Street Railways, City of Detroit, Mich.

FOLLOWING the theory that street railways can reduce materially the rubber-tired competition which has become so keen during the past few years by increasing the attractiveness and improving the riding qualities of the cars, the Department of Street Railways, city of Detroit, has undertaken the task of rehabilitating its rolling stock, track and roadbed. It is thought that newly painted and rejuvenated street cars, running smoothly over new rail, will attract again the patronage which they formerly enjoyed. Since the first of the year 275 cars have been repainted. It is expected that this number will be increased by 100 cars per month in the future. Our first track reconstruction job was on Jefferson Avenue, the principal east and west thoroughfare in the city and second only to Woodward Avenue as Detroit's most important artery of travel.

This undertaking embraces the replacement of rails and pavement from Woodward to Field Avenue (Belle Isle Park), a distance of 2.5 miles of double track. The old construction consisted of an 8-in. concrete foundation; oak ties, on a 1-in. sand cushion; 7-in., 91-lb. rail with cast welded joints, and brick and granite block pavement. The old foundation and ties, although having been in service for a period of nineteen years, were found in good condition and were retained. New 7-in., 93-lb. rail with thermit welded joints has been used and the old granite blocks and nose stones were relaid along the rail, the remaining area being paved with compressed concrete. This renewal work was started May 16 and was completed July 1, at a cost of approximately $200,000.

Because of the heavy traffic on Jefferson Avenue it was decided to carry on the work under traffic and without the use of temporary tracks, which would seriously interfere with vehicular movement. Many day and night shifts totaling approximately 350 men, the work progressed rapidly. Excavation was done by hand, the usable granite block and nose stone being piled back of the curbs and the refuse piled along the track, being loaded by crane on motor trucks during the day and on dump cars at night when the car service was infrequent. The work was done in sections of about 1,500 ft. of single track. Rails were laid on the pavement, just clear of the track, temporarily spiked to oak ties spaced about 20 ft., and tie rods inserted. Thermit welds were made and ground during the day. At night the old rail was removed by use of acetylene torch and crane and the new 1,500-ft. section of track slid into place. Rail-cut ties were adzed and the new track surfaced with oak blocking and steel shims. The latter were placed on the old oak ties and also on the concrete between ties. Thus the rail is thoroughly supported.

After all movement of the rail had been eliminated a 1:2:4 mix of concrete, using cement, sharp sand and No. 6 limestone, was poured to 1 in. above the base of

After the new rail was spiked and shimmed up a 1:2:4 mixture was poured to 1 in. above the ties

Compressed concrete pavement was laid between the rails with granite blocks forming a flangeway

Digitized by Google

rail and thoroughly tamped underneath. Then the old granite nose stones were relaid on a No. 6 stone cushion along the gage side and two rows of granite laid longitudinally along the outside of the rail. A 2-in. to 3-in. layer of crushed stone was then forked in the remaining space, flushed with a 1:2 mix of cement and sharp sand and rolled to form a compressed pavement. Grout for the granite block was furnished as a by-product of this operation. All vehicular traffic was kept off of the new pavement for five days, but street car movement was uninterrupted.

Fares Change with the Day

CHARGING of higher street railway fares for Sunday and holiday riding is quite common in Italy. In Rome, where most of the lines have a flat fare of 50 centesimi, the fare on Sunday is increased to 60 centesimi, and on two suburban lines where the regular fare is 80 centesimi the Sunday fare is 90 centesimi. These additional receipts so obtained are devoted to the city anti-tuberculosis fund. This plan, it might be said, is somewhat more practicable in Rome, where the tramways are municipally owned, than it would be with a private company.

The additional charge of 10 centesimi on Sunday is also followed in Florence, but the prize schedule of varied fares probably belongs to the Lido company. The Lido Tramway is the only one within Venice and its suburbs. It is, of course, not in Venice proper, which has only canals and boats for transportation, but connects the steamboat dock on Lido Island with the popular bathing beach there. The schedule of fares on this line is as follows:

LIDO TRAMWAY FARES

From October 1 to March 31	From April 1 to September 30
Normal days from 9 a.m. to 9 p.m. 40 centesimi	Normal days from 9 a.m. to 10 p.m. 50 centesimi
Sundays and holidays up to 9 p.m. 50 centesimi	Sundays and holidays up to 10 p.m. 60 centesimi
Sundays and holidays after 9 p.m. 70 centesimi	Sundays and holidays after 10 p.m. 70 centesimi

As no fare is scheduled after 9 p.m. in winter or after 10 p.m. in summer on ordinary days, presumably the cars stop at those hours, and those who wish to ride have to take a taxi or walk.

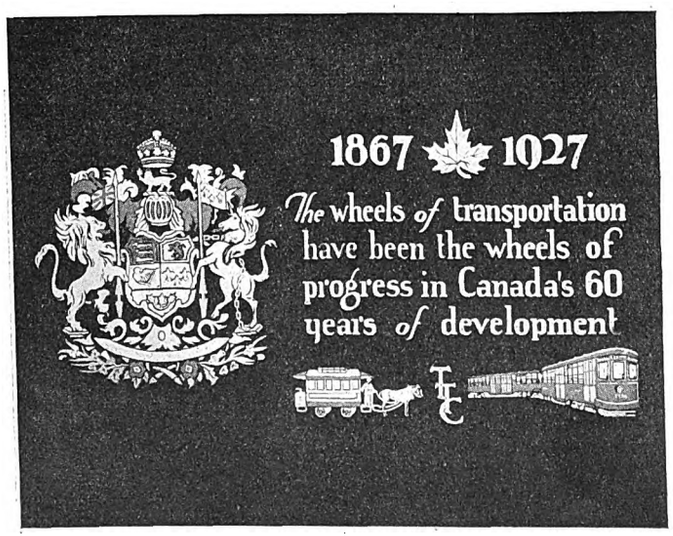
Montreal Benefit Members Get Assistance and Comfort

PLANS covering readjustment of benefits to be paid to members of the Mutual Benefit Association of the Montreal Tramways, Montreal, Que., worked out satisfactorily, according to the report of the association. During the year 32 applications for old age pension were received from men all eligible. The amount of $19,381 was paid to members on old age pension during the year; $6,426 was paid to members on permanent disability pension; $25,000 was paid in death benefits. During a similar period $42,445 was paid to disabled members, as compared with an amount of $13,417 paid in the previous year. The increase is due largely to the higher rate of benefits paid during this past year. In addition an insurance of $1,000 was provided for families of deceased members.

With regard to the allowance received from the Montreal Tramways covering the period from Jan. 1 to April 30, 1926, and amounting to $40,667, from which was deducted the expenses of management during that period, amounting to $6,764, leaving a net allowance of $33,903, it should be explained that this amount is over and above the allowances payable to the Benefit Association by the company for the fiscal year ended April 30, 1927. The balance transferred to reserve fund for the year was $105,132.

T.T.C. Celebrates Canada's Diamond Jubilee

DURING the first week in July Canada celebrated her Diamond Jubilee. During the week the Toronto Transportation Commission displayed a series of striking posters in its cars which indicated the place of transportation in Canada's growth. The posters were artistically painted in oil colors on a black background. The reproduction cannot show the striking contrast of the original. On one side appear the words "The wheels of transportation have been the wheels of progress in Canada's 60 years of development," while on the reverse appears the slogan, "The progress of transportation will pace the progress of Canada to a future of unparalleled development and prosperity."



Striking posters were displayed in the cars of the Toronto Transportation Commission to celebrate Canada's Diamond Jubilee

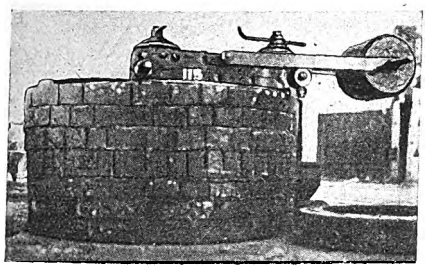
Maintenance Methods and Devices

Electrical Heating for Steel Tires

STEEL tires for car wheels of the underground electric railways, London, England, are heated by an electrical device so that they may be shrunk on the spiders at the company's Acton shops. Wire wound about a central iron core carries an alternating current. The tire slips over this core and itself forms the secondary circuit, thus making it a transformer. The induced current is sufficient to heat the tire to the required temperature, expanding it so that it may be slipped on the spider of the wheel. The primary circuit is automatically opened when this point is reached.

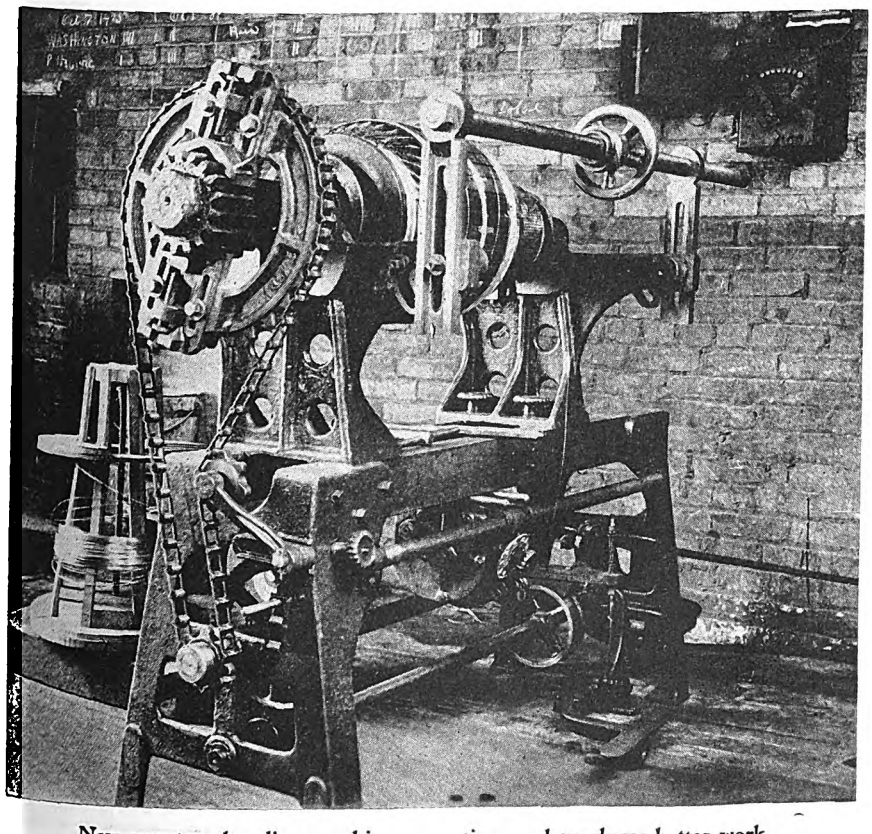


Tires of the London Underground are heated in this electric furnace for shrinking onto the wheels

The transformer is housed in the circular oven shown in the accompanying illustration. The lid, which is of steel, is fastened to the upper portion of the magnetic circuit. The whole is hinged to the outer vertical leg of the transformer and is balanced so that it may be raised easily when a tire is inserted or removed.

Banding Machine a Time Saver

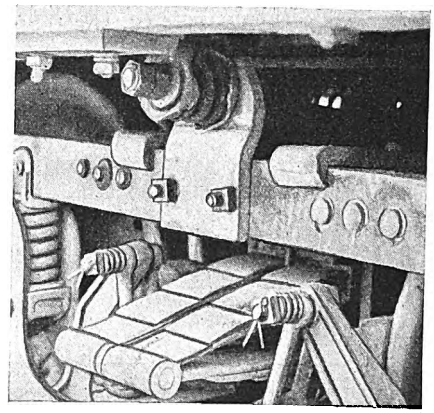
BANDING of a railway motor armature, which formerly took more than one-half hour's time of three men in the shops of the Grand Rapids Railway, Grand Rapids, Mich., now is done by one man in twenty minutes by use of a new Peerless type AP banding machine with improved tension device. The cost per armature is thus reduced from $2.45 to 24 cents. Besides the lower cost, the bands are tighter, so that armature troubles are reduced. With the old method there was an average of one broken or loose band per day. Now the only bands that are broken are caused by armatures which ground and cause the wire to burn off.



New armature banding machine saves time and produces better work

Spring Damper Replaces Friction Type

EXPERIMENTS are being conducted by the Oklahoma Railway, Oklahoma City, Okla., on a pair of type O-50 Standard trucks to obtain easier riding qualities by replacing the friction type damper on the swing bolster with two coil springs mounted on each side of the center plate. The spring, of 5/8-in. diameter steel, coiled to an outside diameter of 3 in. and approximately 4 in. in height, is carried on a 1-in. rod which is fastened to the center plate of the truck bolster. One of these rods is mounted on each side of the center plate.



Spring type of swing bolster damper applied to an O-50 Standard truck

One of these springs mounted on a 1-in. rod connecting with the center plate of the truck bolster is placed on each side of the truck frame. A tension of 10 lb. is applied to each spring when the bolster is in normal position.

A lug of 3/4-in. steel plate is fastened to the top side truck member. The rod from the center plate passes through a hole in this lug. The spring is on the outside of the lug and is drawn up against it by nut and lock-nut. A tension of about 10 lb. is applied to the spring when the truck and swing bolster are in normal position.

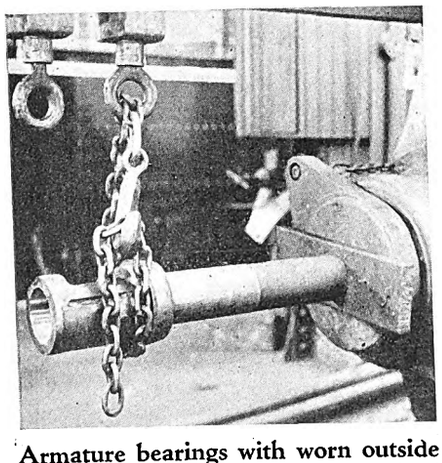
One of the older type cars has been equipped with trucks fitted with this

Digitized by Google

spring damper. It is the opinion of mechanical and transportation departments that the addition of the spring damper has improved materially the riding qualities of the car. Adaptation of the spring damper to other types of trucks will depend on satisfactory results from tests being made with this one car.

Armature Brasses Expanded on Wheel Press

BRASS armature bearings which have been removed from the shells of car motors of the Oklahoma Railway, Oklahoma City, Okla., for rebabbitting and whose outside diameters have become too small for a pressing fit into the shell are expanded in a wheel press by forcing a bar somewhat larger than the inside diameter through the brass. Four sizes of mandrels have been made for this expanding process. Usually it is necessary only to expand the brass from 0.005 to 0.010 in. to obtain the proper fit. However, in experiments conducted in the shops to determine to what extent the expanding may be carried, the diameter of one brass was expanded 0.016 in. in one operation. It is felt that the shell can be expanded repeatedly until it is too thin to hold the babbitt lining.



Armature bearings with worn outside surfaces are expanded on a wheel press by forcing a mandrel through the inside bore

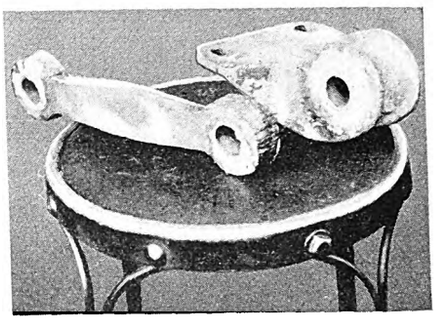
An increase of 0.016 in. in diameter has been accomplished by this method. A chain hoist is holding the brass and mandrel at the tailstock end. In operation a fixture on the tailstock holds the brass while the mandrel is pressed through.

In order that only a limited number of mandrels need be required for the variety of inside bores, the brass is poured with babbitt and bored to a size smaller than that of the mandrel to be used in expanding it. The difference in diameter between the bored brass and the mandrel is the amount the outside diameter is to be increased. Even with this additional work of pouring and boring the brass the reclaiming process is cheaper than installing new bearings.

The head of the mandrel is fastened in a chuck, which in turn is carried by the ram head of the wheel press. A suitable chuck that fits in the tailstock of the press holds the shell while the bar or mandrel is pressed through. Approximately 10 tons pressure will expand or stretch the brass 0.010 in.

Rattle Eliminated in Truck Hangers

BALL and socket swing bolster hangers originally used on various types of Brill trucks are rebuilt in the shops of the Dallas Railway & Terminal Company, Dallas, Tex., to eliminate the rattle prevalent when the ball and socket become badly worn. The bracket containing the socket is bored to take a length of 1¼-in. outside diameter steel tubing. The space between the tubing and the rim of the socket is filled in by electric welding. The link, originally having the ball at each end, is flattened out and drilled to take a similar size piece of tubing. The ball and socket joint is thus replaced by a plain flat joint held together by a 1-in. bolt.



Rebuilt link and bracket of ball and socket joint

To eliminate the rattle which might develop after such a joint becomes worn a piece of 1⅜-in. x ⅛-in. spring steel is fastened at the middle of the link. Holes in the spring fit over the ends of the bolt, producing a pressure on the coupling at the joint. All of the spare and worn links and brackets on hand have been rebuilt and eventually all of the trucks will be equipped with the remodeled link. It is anticipated that as this new type of joint wears out it may be rebuilt by inserting a new piece of 1¼-in. steel tubing.

July 31 Is the Dead Line for Maintenance Competition

TO BE eligible for one of the capital prizes of $200, $100 and $50, material submitted in ELECTRIC RAILWAY JOURNAL'S maintenance competition must be mailed before Aug. 1, 1927.

This is the last week to send in material for the capital prizes. Those who have been putting off submitting their kinks should get busy at once. All material received will be turned over to the judges immediately after Aug. 1 for their consideration in awarding the capital prizes.

Prizes of $25 each will continue to be awarded each month until the end of April, 1928, and material for these may be submitted any time until then. Of course, every one is anxious to go after the big prizes, and that requires immediate action. If photographs of the device to be submitted are not available a rough sketch will be sufficient.

Here is a brief summary of the contest conditions:

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated prior to Aug. 1, 1927. For the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints, or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given above will be found in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

American Association News

American Executive Committee

AS THE guests of Barron Collier aboard the delightful steam yacht *Florida,* the American Electric Railway Association executive committee took advantage of the cooling breezes of New York harbor by holding a busy all-day meeting devoted to heading up the work of the association for the year. Those in attendance included the following:

W. H. Sawyer, president; R. P. Stevens, J. H. Hanna, L. S. Storrs, F. R. Coates, L. E. Lippitt, C. B. Proctor, Daniel Durie, T. A. Kenney, M. B. Lambert, S. J. Cotsworth, H. L. Brown, E. B. Meissner, J. N. Shannahan, R. I. Todd, Edward Dana, E. C. Faber, C. B. Keyes, L. H. Palmer, H. B. Cobban, A. M. Hill, T. R. Langan, R. B. Stearns, T. A. Cross, F. W. Doolittle, Charles Gordon, J. W. Colton, F. C. J. Dell, G. C. Hecker, A. C. Meyer, E. J. Murphy, Labert St. Clair, L. C. Vickers, J. W. Welsh.

The general plan and character of the program being prepared for the annual convention in Cleveland was presented in some detail by H. L. Brown, chairman. In several respects this represents a considerable departure from previous convention programs. It is planned to use the luncheon conference method for the double purpose of covering a wide range of the most important industry problems, while at the same time bringing together in informal meetings the younger, as well as the better known, railway executives having interests in common.

On Tuesday there are to be six and on Wednesday eight of these luncheon conferences, making a total of fourteen for the two days. A sponsor will be appointed for each luncheon, to stimulate and direct the discussion, but there will be no formal addresses; the purpose of the meeting being to permit executives to compare notes and experiences and to get new ideas for the improvement of the situation on their respective properties. On Thursday one large luncheon conference is planned, which will be devoted entirely to the interurban situation and which is intended to bring together interurban executives for a discussion of their particular problems.

Outstanding Speakers Planned

Having provided through these luncheon conferences for the discussion of direct industry matters, attention will be given in the preparation of the program for the morning meetings of the American Association to the selection of capable speakers, mostly from outside the industry, who can suitably interpret subjects of broad interest to the industry as a whole. An effort is being made to obtain speakers of national reputation for this phase of the program. A feature of the Thursday morning program will be a symposium of five-minute discussions by men in the industry whose properties have made notable progress in the improvement of service, reduction of costs or stimulation of new business.

Plans for Entertainment at the Convention

Convention entertainment plans were reported by E. C. Faber, chairman. After having worked out a budget to cover the expense of providing the program contemplated, Mr. Faber's committee asked for an additional appropriation of $1,500, which was granted by the executive committee. The services of the Pittsburgh Railways Band and of the Cleveland Railway Male Chorus have been arranged for by the committee, so that an adequate musical program for concert entertainment and dancing are assured. A report from the exhibit committee, presented by F. C. J. Dell, showed a substantial increase in space sales over the corresponding period of last year. Periodic reports of the progress in the sale of exhibit space have been published in the Journal over a period of several weeks.

J. H. Hanna, chairman, reported for the publications committee. Since the last meeting of the executive committee, the publications committee has been organized and has decided upon November 1, 1927, as the date for the first issue of *Aera* in its new form without advertising. Mr. Hanna said that the terms of the agreement to be made for the publication of *Aera* without advertising at no increased cost to the association, in accordance with the recommendations of the policy committee and the action of the executive committee at its last meeting, were discussed and outlined by the publications committee and are to be prepared in tentative form so that they can be sent to the committee members for additional suggestions and comments.

Training for Conference Leaders at Cleveland

Edward Dana, chairman of the educational committee, reported that arrangements are proceeding for holding a group conference leader training course during the Cleveland convention. The committee plans to get out circulars calling attention to these courses and urging railway executives to send men qualified for group conference leadership to take the training under Dr. Cushman's direction.

A report of the special committee appointed at the last executive committee meeting to look into the matter of recent developments in car and truck design was made by its chairman, M. B. Lambert. The committee found that the new designs of equipment are being brought out conservatively, and that in each instance manufacturers and operators interested in these new designs are proceeding on an experimental basis, and are showing no tendency toward either the promotion or the application of radical departures from conventional practice without taking steps to assure adequate tests of the new designs. The report was received and placed on file. On motion of Mr. Lambert, the matter of new car development was referred to the Engineering Association with instructions that the subject be studied by it and a report prepared through the committee on unification of car design.

New Constitution Ready

Final changes recommended in the new draft of the constitution and by-laws of the association were read by H. L. Brown, reporting for the committee. The new constitution is now in final shape for submission to the convention. L. C. Vickers, for the committee on taxation, said that effort is

COMING MEETINGS OF *Electric Railway and Allied Associations*

***July 27-29*—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Biltmore Hotel, Atlanta, Ga.**

***Aug. 4*—New England Street Railway Club, Annual Outing, Whalom Park, Fitchburg, Mass.**

***Aug. 18-19*—Wisconsin Utilities Association, Transportation Section annual convention, Hotel Pfister, Milwaukee, Wis.**

***Sept. 1-4*—Tenth Annual Conference on Human Relations in Industry, Silver Bay on Lake George, N. Y.**

***Sept. 8*—Central Electric Railway Master Mechanics Association, South Bend, Ind.**

***Sept. 13-15*—International City Managers Association, Dubuque, Ia.**

***September 19-23*—American Welding Society, national meeting, Book-Cadillac Hotel, Detroit, Mich.**

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Digitized by Google

being devoted at the present time toward securing a reduction in corporation income taxes to take advantage of the present large surplus in national tax income. The attention of the committee is also being centered actively on proposed tax legislation in various states. In some instances there have developed a large number of bills affecting utility taxes.

Resolutions on the death of General Guy E. Tripp were adopted by the executive committee, and it was decided to send copies of this resolution to General Tripp's family and his company.

A report for the convention hotel committee was made by G. C. Hecker of the association staff. A total of 3,312 rooms are available at Cleveland for convention delegates. Of these 1,214 had been requisitioned up to July 10. Although this represents only slightly more than one-third of the total rooms available, the facilities in the Cleveland and Hollenden hotels have been practically exhausted by reservations already made.

In the absence of T. W. Casey, chairman, M. B. Lambert reported for the convention special manufacturers' committee, to which had been referred the matter of the printing of registration lists. This committee recommended printing a bound cumulative booklet of registrations, and it was thereupon decided to provide such a booklet at the Cleveland convention.

H. B. Cobban, president Midwest Electric Railway Association; A. M. Hill, president Public Utilities Association of West Virginia; T. R. Langan, president Metropolitan Community Section, and R. B. Stearns, president New England Street Railway Club, were present at the meeting as representatives of sectional and state associations and were introduced in turn by President Sawyer. A. M. Hill, who is also chairman of the Motor Bus Division, American Automobile Association, said that the directors of his organization were planning to hold a meeting in Cleveland on Tuesday of convention week. As a measure of co-operation the secretary was instructed to work out some arrangement for admission of A.A.A. bus division members to the association's exhibit during convention week.

Affiliated Associations Have Work Organized

Progress in the work of the affiliated associations was reported by their respective presidents. Daniel Durie, president of the Engineering Association, outlined a new plan of holding simultaneous meetings of the four different engineering groups for the presentation of reports, so as to leave two complete days of the convention free for addresses and discussions. Mr. Lippitt for the accountants, and Mr. Proctor, for the Claims Association, reported that their programs are well outlined and that they anticipate an interesting and profitable series of meetings. Both Mr. Lippitt and Mr. Proctor requested the co-operation of President Sawyer in urging executives of railway properties to permit accountants and claims men to attend the convention so as to take part in the programs of their respective associations.

Following the completion of routine business a number of points were brought up suggesting matters which need the attention of railway men. R. B. Stearns, president Eastern Massachusetts Street Railway and president of the New England Street Railway Club, commented on the laxity of street railway men toward the activities of their state committees on public utility information. It was suggested in this connection that much greater co-operation by railway men is needed for getting the information prepared by the state committees into the columns of local newspapers.

The next meeting of the executive committee was set for Aug. 26 in Cleveland.

Engineering Executive Committee

CONSIDERATION of the program for the Cleveland convention and review of committee reports were the principal items taken up at a meeting of the executive committee of the Engineering Association held at association headquarters, New York City, on July 18. Those present were President Daniel Durie, R. H. Dalgleish, W. F. Graves, P. V. C. See, L. D. Bale, W. W. Wysor, A. T. Clark and H. H. George.

On account of the expansion of the activities of the Engineering Association and the desire to hold to a minimum the discussion of committee reports on the floor at the annual meeting, it is planned to devote the Monday and Thursday sessions at the convention to general topics, including addresses and discussions. The Tuesday meeting will be divided into four parallel sessions, the principal topics at these being rolling stock, way and structures, power, and purchases and stores. In order to work out the details of the program the chair appointed a committee consisting of Messrs. Bale, Wysor, See, Clark, George and McVittie.

The committee on Engineering Manual reported through Mr. Hecker that the distribution of the 1926 edition has progressed satisfactorily. Attention was called to an error on page 572 in the drawing of the limit of wear gage, which should be for the high flange instead of the low flange. It was agreed that a new page making the proper correction should be prepared and sent out.

Reports of the various committees on the year's work were reviewed briefly. These will be prepared for publication and distributed prior to the convention, according to the usual procedure.

The appointments of judges in the Electric Railway Journal Maintenance Men's Contest, who were appointed some time ago by President Durie, were confirmed. These are A. T. Clark, F. McVittie, H. H. George, G. C. Hecker and Charles Gordon.

The report of the committee on nominations, selecting names for officers for the coming year, was received and approved. The list of nominations was published in Electric Railway Journal for July 9, page 73.

It is planned to have the next meeting of the executive committee at Cleveland on Saturday or Sunday immediately preceding the convention.

Claims Executive Committee

MEMBERS of the executive committee of the Claims Association held a meeting at association headquarters on July 16. Those present were President C. B. Proctor, C. E. Redfern, E. N. Muldoon representing G. T. Hellmuth, and E. L. Lindemuth of the executive committee; committee chairmen W. F. Weh, W. M. Holtz and H. K. Bennett. G. C. Hecker acted as secretary.

In the minutes the secretary called attention to the action taken last October, that reports of committees and speeches to be delivered at the convention will not be printed and distributed in advance this year.

William G. Marshall, chairman of the committee on employment, sent a letter stating that on account of lack of duties it was recommended that his committee be disbanded. After discussion it was voted to take action to that effect.

Reporting for Chairman Hellmuth, Mr. Muldoon stated that the report of the committee on bonus and award systems will not be ready until early in September. It will then be distributed to the members of the executive committee for review.

Mr. Bennett presented the report of the committee on traffic and safety. This report, he said, had been reviewed by the executive committee of the Transportation & Traffic Association. It was approved by the Claims executive committee.

The report of the medical and surgical committee was presented by Dr. Holtz. This was approved with the suggestion that some well-planned action be taken to stimulate greater interest in the work of this committee.

Attention was called by the president to the letter from Executive Secretary J. W. Welsh advising of the desire of the American executive committee to have an editing committee of each of the affiliated associations which would eliminate extraneous matter so as to reduce the bulk and the expense of printing the proceedings. It was agreed that this year's reports would be reviewed by Mr. Weh. The appointment of an editing committee was referred to the next administration.

Mr. Weh presented the report of the program committee. It was proposed to have the Monday session devoted to papers and prepared discussion. Tuesday's session would be a joint session with the Transportation & Traffic Association, while on Thursday there would be a symposium on claims subjects, followed by papers on medical and surgical work. The report was tentatively approved subject to such modifications as the chairman of the committee might

Digitized by Google

find it necessary or desirable to make.

The date of the next meeting was set for either Saturday, Oct. 1, or Sunday, Oct. 2, at the discretion of the president.

Entertainment

DEFINITE plans for the entertainment of delegates and guests at the American Electric Railway Association convention to be held at Cleveland, Oct. 3 to 5, were completed at the second meeting of the entertainment committee held in Cleveland on Monday, July 11. Sub-committees appointed at the previous meeting reported on each item of entertainment and for each period of the convention week.

The continued growth of the electric railway conventions was recognized by the committee and more extensive plans were developed accordingly. An unusual feature of this year's convention occasioned by the opening of the convention on Saturday noon required the provision of musical features for both Saturday and Sunday immediately prior to the week of meeting.

On Monday night will be held the usual reception of officers of the association, followed by dancing. Tuesday evening will be devoted to the Advisory Council and the program that it is now developing. Wednesday evening there will be a theater party at the Keith Theater, and the entire house will be engaged for the members and guests of the association, following a plan similar to that which was mapped out for last year, but which unfortunately was not carried out due to the untimely death of John Stanley. This leaves the convention buildings free for lay visitors to view the exhibits. It was also thought advisable to have one evening's entertainment planned away from the exhibition halls. Thursday evening will be devoted to a grand ball, with many excellent features planned in addition.

A special drive is being made to increase the attendance of ladies and special plans are being developed for their entertainment. Besides receptions at the Auditorium on Sunday and Monday afternoon, at which musical programs and refreshments will be provided, there will be a luncheon at the Acasia Country Club on Tuesday, preceded and followed by bus drives through Cleveland parks and residential districts. A bridge party with many attractive prizes is planned for Thursday, and in addition a number of other events will be offered for the entertainment of the visiting ladies of the convention.

At the meeting Edwin C. Faber presided as chairman. Other members of the committee present were T. O. Kennedy, Joseph H. Alexander, L. J. De Lamarter, John A. Dewhurst, R. W. Emerson, T. A. Ferneding, A. H. Ferrandou, F. V. Gantt, C. D. Porter, J. B. Stewart, Jr., H. B. Weatherwax, E. F. Wickwire, F. H. Wilson, P. E. Wilson, Leslie Paul representing Karl A. Simmon, J. E. Lytle representing C. L. Van Auken, J. W. Welsh, and Fred B. Bullock.

New Association Memberships

MEMBERSHIP in the American Electric Railway Association was voted by the executive committee at its meeting held on July 15 to one operating company, one associate, 25 manufacturers and ten individuals. A list of the new company members follows:

OPERATING COMPANY

Canadian National Railways, Montreal, Que., Canada.

ASSOCIATE

Miller-Schorn Rapid Transit System, consulting engineers, Detroit, Mich.

MANUFACTURER COMPANIES

American Brake Materials Corporation, Detroit, Mich.
American Hammered Piston Ring Company, Baltimore, Md.
Blackhawk Manufacturing Company, Milwaukee, Wis.
Bonney Forge & Tool Works, Allentown, Pa.
S. F. Bowser & Company, Inc., Fort Wayne, Ind.
The Carborundum Company, Niagara Falls, N. Y.
Elite Manufacturing Company, Ashland, Ohio.
Federal-Mogul Corporation, Detroit, Mich.
J. B. Ford Company, Wyandotte, Mich.
General Metals Company, Inc., Philadelphia, Pa.
Illinois Motive Equipment Company, Chicago, Ill.
David Lupton's Sons Company, Philadelphia, Pa.
Mather Spring Company, Toledo, Ohio.
Motor Wheel Corporation, Lansing, Mich.
Oil Jack Company, Inc., New York, N. Y.
Safety Equipment Service Company, Cleveland, Ohio.
Steel Wheels, Inc., Newark, N. J.
Stevens Walden-Worcester, Inc., Worcester, Mass.
Van Norman Machine Tool Company, Springfield, Mass.
Vlchek Tool Company, Cleveland, Ohio.
Wadell Engineering Company, Newark, N. J.
Walker Manufacturing Company, Racine, Wis.
Weaver Manufacturing Company, Springfield, Ill.
Wilkening Manufacturing Company, Chicago, Ill.
Zenith - Detroit Corporation, Detroit, Mich.

News of Other Associations

New England Outing Aug. 4

SOME 300 members of the New England Street Railway Club are expected to attend the annual outing of the organization, which will be held this year on Aug. 4, at Whalom Park, on the outskirts of Fitchburg, Mass. An all-day program, which will include sports and other forms of entertainment, is being arranged by John Belling, secretary, and members of the entertainment committee. The club will devote part of the afternoon entirely to water sports. There will also be a ball game. Lunch will be served at noon at Whalom Inn and in the evening there will be a dinner.

Silver Bay Conference Announced

FINAL arrangements have been made and the program announced for the tenth annual conference on Human Relations in Industry. The conference will be held at Silver Bay on Lake George, N. Y., under the auspices of the industrial department of the Young Men's Christian Association. The meeting will be Sept. 1-4. As in past years, the program will include addresses on such topics as the responsibilities of modern business, improving industrial relations and better citizenship of the worker.

During the week of Aug. 25 to Sept. 1 the foreman leadership course will be held under the instruction of Arthur L. Mann, industrial extension division, New York State Department of Education.

Those desiring to attend should make arrangements with Fred H. Rindge, Jr., executive secretary, 347 Madison Avenue, New York City.

Two International Associations to Consolidate

AT THE fourth annual convention of the Internationaler Strassenbahn- und Kleinbahn Verein, held in Copenhagen, June 22-24, it was voted unanimously to combine with the Union Internationale de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles. This action was taken on the invitation of the latter association. The union will result in a return to the conditions existing before the war, when there was only one association representing all of the local transportation companies in western and in central Europe. The headquarters of the consolidated association will be, as formerly, in Brussels, and the Internationaler Strassenbahn- und Kleinbahn Verein will pass out of existence.

To facilitate the consolidation the union agreed to make several changes in its constitution. One of these is that the proceedings, instead of being in French only, will now be conducted and printed in both French and German, and the executive committee is empowered to authorize the use of other languages also. Another change to be made in the constitution to effect the consolidation is to increase the size of the executive committee. The clause in the present constitution which provides that the members shall be at least ten and not more than twenty will be changed to read "not less than twenty nor more than twenty-five." It is proposed to add immediately six more members, of whom four will be from Germany, one from Austria and one from Hungary. It has also been agreed that at the time of the next vacancy among the vice-presidents, the post shall be filled by a representative from Germany.

News of the Industry

Duluth Company Not Required to Pave

The Minnesota Supreme Court at St. Paul, Minn., on July 15 handed down a decision in the appeal by the city of Duluth, with the Duluth Street Railway as respondent, affirming the lower court's decision that the company's franchise does not compel it to pave or repave streets, but does make the company responsible for additional paving expense incurred because of its operation. The city charged the company $40,000 and its share in paving two streets and brought action to recover when the company refused payment. The District Court awarded the city $7,000 as the company's share of the paving cost because of its operation on the two streets.

In reaching the decision the court stated that the defendant's franchise duty with respect to paving applies "in case" the city of Duluth "shall at any time pave or otherwise improve the surface of any street along which said railway may run." That language refers to any repaving as well as to the first paving of the street occupied by defendant's tracks.

Under a franchise imposing the duty on a railway company, whenever a street is paved or otherwise improved, "to pay only so much of the expense of paving the street as is made extra by reason of said railway," there is no duty to pay the whole cost of repaving solely because another section of the franchise imposes a duty to keep the intertrack space in "proper repair."

Chicago Surface Lines Franchise Extended for Four Months

In order to allow time to work out an agreement for the permanent settlement of the Chicago railway problems, an ordinance was passed on July 13 by the City Council extending for a period of four months the present day-to-day franchise under which the Chicago Surface Lines have been operating since their twenty-year franchise expired on Feb. 1.

Application for a grant of six months was filed with Corporation Counsel Ettelson recently by Leonard A. Busby, president of the Chicago City Railway, but at the suggestion of Mayor Thompson an extension for only four months was voted. The new extension is similar to the present one, which expires on July 31, with both parties qualified to terminate the agreement on 30 days notice. The operating agreement between the various component lines for exchange of transfers is to be continued. Before the extension can be accepted by the receivers of the Chicago Railways, however, it is understood that the agreement will have to be reviewed by the federal courts.

Many of the Chicago Aldermen have indicated a desire to work through the summer in order to have some form of ordinance ready to submit in the fall to the special session which Governor Small has virtually promised to call if the city and companies can agree on the legislation required.

As a basis for these negotiations between the transportation companies and the city, the five railway bills which failed of passage at the last session of the General Assembly are to be brought up at the new conferences.

The chief point of controversy at local transportation committee meetings during the past week has been the question of whether, as suggested by Governor Small, the new ordinance should be drafted first and be submitted to a referendum before enabling legislation is sought, or whether action should be deferred until after the legislation is obtained.

Hearing on Fare Increase in Atlanta

P. S. Arkwright, president of the Georgia Power Company, reveals figures showing losses sustained by railway operation—Opposition claims many concessions have been made to company

FOLLOWING a hearing on the question of revised rates charged by the Georgia Power Company in Atlanta, the Georgia Public Service Commission is considering whether or not an increase in fares will be allowed and, if so, how much of an increase will be permitted. President Arkwright of the power company defended the proposed increase, while the opposition was led by James L. Mayson, city attorney.

In his evidence Mr. Arkwright pointed out that in the period between 1920 and 1926 the railway department of the power company had failed by more than $7,000,000 to make the 8 per cent allowed by the commission. The gross revenue of the department, he stated, was $5,256,000 in 1926, compared with $2,900,000 in 1914, but operating expenses increased from $1,966,000 to $4,000,703 and net earnings had decreased from $933,000 in 1914 to $552,000 in 1926, despite economies in equipment and operation.

From 1914 to 1921 earnings of the department, according to Mr. Arkwright, averaged 4.6 per cent. In 1922 they were 3.2 per cent on the investment; in 1923, 2.9 per cent; in 1924, 2.2 per cent, and in 1925—the year of heavy and unregulated jitney competition—1.3 per cent. In 1926, with jitneys under control and recommendations of J. A. Beeler in effect, earnings of the department rose to 2.2 per cent.

The principal grounds contained in the opposition voiced by City Attorney James L. Mayson were that on the basis of its own valuation of $78,510,000 the earnings of the Georgia Power Company were $8,401,699, or approximately 13 per cent; that the power company's methods in dividing its property and showing a loss in one department, while others showed profits, was "unnatural and unfair"; that the city had already made many concessions to the company in eliminating jitney competition, allowing the use of one-man cars, and so on, and that these should have permitted the necessary return on the investment, and that the 5-cent fare for school children recommended in the Beeler report had not been granted. In short, Mr. Mayson urged that the present rates be maintained for fares in Atlanta and that a 5-cent fare be provided instead of a 7-cent fare for school children.

The company's petition, filed on May 30, asks that the cash fare be made 10 cents instead of 7 cents as at present, and tickets be sold at the rate of three for 25 cents, instead of at the rate of three for 20 cents as at present.

In a statement issued at the time the petition was filed, P. S. Arkwright, president, declared that despite the fact that the railway system had not earned a fair return on the fair valuation of its properties, it had gone about giving Atlanta the best possible service.

He said that millions of dollars had been poured into a losing property on the principle that the best way to earn the support of the public was to give it a service second to none. The public is willing to support a modern, up-to-date transportation service, Mr. Arkwright stated, and to that end everything humanly possible had been done to provide good service first. Many new street cars had been added, more track laid, service interruptions cut down to a minimum, schedules speeded up and many other improvements made.

Whether or not the readjustment is allowed depends upon the commission. It is expected that hearings will last several days, and that the commission will take the matter under advisement before rendering its decision.

City Control Suggested by Jacksonville Committee

City control of the Jacksonville Traction Company, Jacksonville, Fla., was suggested in the proposed franchise submitted by the citizens' traction committee to the laws and rules committee of the City Council on July 15. The proposed franchise was referred back to a sub-committee for redrafting with no major changes and will be resubmitted later.

The provisions of the proposed franchise, however, were outlined and brought before the City Council for temporary consideration. The purpose of the proposed franchise is to enable the city to procure an adequate and efficient system of transportation and at the same time to enable the company to earn a reasonable return upon the property owned by it and used for transportation purposes. One of the provisions of the franchise would create the position of traction director, who would be appointed by the City Commission and who would have full control of all of the railway's affairs. The draft provides that the company shall be allowed to earn 8 per cent on a valuation fixed by agreement between the city and the company and establishes the franchise for a term of 30 years, subject to renewal at any time. The company would be required to pay for paving between its rails and also to pay a 3 per cent franchise tax, provided this tax is earned over the allowed 8 per cent.

Three important features of the ordinance still unsettled are the value of the company's property, the proper method of account for depreciation and the matter of extensions and additions.

The franchise, to become effective, must be adopted by the Council and submitted to the voters of Jacksonville and ratified by them. Also, the company must exhibit its financial ability to comply with the terms of the franchise.

Appoint Arbiters; Ask Federal Court's Approval in Chicago

Threats of a strike in Chicago were definitely removed on July 19, when James M. Sheean, attorney for the Chicago Surface Lines, appeared before Federal Judge James H. Wilkerson to obtain approval of the arbitration plan previously agreed upon by a wage conference sub-committee composed of three officials of the street car men's union and three Surface Lines representatives. The chief points in the wage dispute which will be submitted to arbitration are demands of the platform men for an increase of 15 cents an hour, a $1,000 free life insurance policy and a $20 a week sick benefit, together with the counter demand of the companies for a wage reduction of 5 cents an hour. It is understood that the demand of the companies for a change in the working day from eight to nine hours to avoid excessive payments of time and a half for overtime will not be submitted as an issue in the arbitration proceedings.

Due to the fact that more than half of the Surface Lines' property is involved in federal receivership, arbitration of these questions must await an approving order by Judge Wilkerson.

Selection of Circuit Judge Keckham Scanlan to represent the Surface Lines employees on the Board of Arbitration and E. J. McIlraith, staff engineer of the system, to represent the companies was announced at the conclusion of negotiations on the same day the plan was presented to Judge Wilkerson. These two men are expected to meet soon and choose a third and disinterested member of the board.

In the parallel negotiations between Chicago Rapid Transit Company executives and employees, concerning demands of the latter for a 5-cent hourly wage increase, current developments indicate that the same form of arbitration as worked out by the Surface Lines operators and employees will be adopted.

Reaching an apparent deadlock with company officials in their demand for a raise of 15 cents an hour over the present 75-cent scale and changes in working rules, trainmen of the Chicago, Aurora & Elgin Railroad voted on July 18 to authorize heads of their union to call a strike in the event their negotiations proved unavailing.

Albee Asks Vaudeville Actors Not to Make "Cheap" Jokes

Edward F. Albee, president of the Keith-Albee Theaters, in a special letter to vaudeville actors playing his circuit, said that he did not regard a derogatory comment about local street car service as either funny or entertaining and that he did regard it as injurious both to transportation lines and theaters. Mr. Albee's letter follows:

I have had a number of complaints from the president and other officials of different street car lines in cities where vaudeville people play complaining that vaudeville artists have on many occasions referred in a derogatory way to street car lines, some artists going so far as to make cheap jokes of the same. I feel that this is not comedy or entertainment, but a direct injury both to the street railways and to the theater where the vaudeville artists are working. For without the street cars, I can't conceive how our patrons could reach our theaters. All of our patrons don't own automobiles.

I feel that the artists do this thoughtlessly, and I am prompted to call their attention to it in the interest of the vaudeville theaters as well as the railways. Our theaters are not places for criticism from our stages, but for entertainment, and I trust, in the future, artists will refrain from using cheap jokes, not only in reference to street car companies but to any other industry or officials of our nation, state or city.

Formal Celebration Marks Opening of Grand Rapids Line

A big celebration has been planned to mark the official opening of the United Suburban Railway, successor to the Grand Rapids, Holland & Chicago Railway, which recently was sold under the hammer. The United Suburban will operate the line from Grand Rapids to Jenison, Mich., a distance of about 8 miles, having recently incorporated for $50,000, all paid in. The stock is held by residents in the different communities to be served.

For the opening on Saturday, July 23, the company has adopted the slogan: "Leave your automobile at home and ride the interurban."

The program for the formal opening calls for the festivities to start at 1 p.m., when a special car will leave Grandville carrying company officials, members of the entertainment committee and the Grandville Boys' band of 25 pieces. The car will run to Grand Rapids, where speakers of the day and invited guests, city officials and electric railway men will be taken on board at the Michigan Railway Company's station and the return trip begun. At 2 p.m. the Grandville celebration will start. All patrons will be given tickets, when fares are paid, entitling them to lunch. Saturday night there will be a fireworks display at Grandville.

Car service was begun on the line July 20. The schedule has been arranged so that the last car will leave Grand Rapids at midnight and the last car will leave Jenison at 11:30 p.m. The later cars are intended for the accommodation of theatergoers and others. The balance of the schedule will provide for a fifteen-minute service during the rush hours and half-hourly service during the remainder of the day.

Amalgamated Seeks to Re-enter New York City

Leaders of the Amalgamated Association have attacked the legality of the contracts of the Interborough Rapid Transit Company with its men and continue to try to induce men in the Interborough Brotherhood to join their union. The Amalgamated is seeking to regain a foothold in the New York rapid transit lines. In support of its attempt to enter, the Amalgamated has threatened to invoke court action attacking the legality of the Interborough's contracts with its men on the ground that they were "signed under duress." The contracts which the company claims 95 per cent of its men have signed guarantee two years employment unless that employment is terminated by mutual consent, with a provision against their joining any outside labor organization. Union leaders assert that having done everything in their power to arrange an amicable settlement and having received no reply to requests for a conference, they are at liberty to call a strike.

Frank Hedley, president of the Interborough, said that the principal reason

Digitized by Google

against recognition was that the brotherhood insisted that all employees be members if they wished employment. Mr. Hedley cited the case of the 1916 strike, when members of the Amalgamated assaulted many loyal workers of the Interborough, and stated that he would be guilty of committing a great "blunder" to consent to his men joining the Amalgamated.

Leaders of the union in answer to Mr. Hedley's statements declared that his claim that 95 per cent of his men had signed the contracts was absurd.

It is probable that the State Industrial Survey Commission may decide to inquire into the situation.

R. M. Feustel to Help St. Louis Draft New Franchise

Robert M. Feustel, Fort Wayne, Ind., has been asked by Mayor Victor J. Miller of St. Louis, Mo., to help draft a franchise on the service-at-cost plan to be submitted later to officials of the St. Louis Public Service Company, which plans to buy the properties of the United Railways at foreclosure on Aug. 1. Mr. Feustel was a witness for the United Railways in the recent hearings before the Missouri Public Service Commission on the application of Receiver Wells for a higher fare, and in support of Mr. Wells' claims for a rate-base valuation "in excess of $75,000,000."

Mayor Miller will make no attempt to include either a rate-base valuation or the rate of return the company shall be permitted to earn, since the Missouri Supreme Court in a recent decision held that the Public Service Commission alone has jurisdiction over such matters. However, the city administration hopes to exercise some control over service by providing for a transportation commissioner who will have a voice in the management of the railway if it accepts the contemplated franchise.

The activity and present high value of the service company stock reflects the general opinion of the traders of St. Louis that the Missouri Public Service Commission will eventually grant the company the right to earn a return on much more than the tentative valuation of $52,000,000 fixed a few weeks ago. In hearings before the commission railway officials contended for a valuation of from $75,000,000 to $100,000,000. Close students of Missouri utility affairs believe that the new company will be granted the right to earn at least 7 per cent on a valuation of not less than $65,000,000 and perhaps $70,000,000. Others, however, are hopeful of a 7 per cent return on a valuation of not less than $60,000,000. They believe the city will accept that basis under a service-at-cost plan of operation.

Mayor Miller on July 20 informed Frank O. Watts, chairman of the reorganization committee of the United Railways, that he is opposed to granting immediately a 30-year franchise to the present company or its proposed successor, the St. Louis Public Service Company. The Mayor told Mr. Watts that he is still carefully considering the whole transportation problem, including the future development of subways and elevated lines, but expressed the belief that public interest probably would be best served by granting no new franchise at this time, and that it might be well to permit the railway to continue to operate under the present franchise, which has at least twelve years to run.

Seattle's System Discussed

Councilman returns from trip east convinced that Municipal Railway must get aid from city's general fund

DECLARING that Seattle's Municipal Railway must get aid from the city's general fund, which is raised by taxation, if adequate transportation is to be developed and maintained at a rate of fare demanded by the car riders, Councilman Oliver T. Erickson, veteran legislator, states that he is ready to take the initiative in preparing for submission to the voters at the next city election any proposed legislation required for this radical step. Mr. Erickson is leader of the majority group of five in the City Council and chairman of the utilities committee. He states that he will talk over the situation with other members of the Council, with a view of submitting a proposition to the people at the election next spring.

Meantime, Mr. Erickson's proposal has brought a storm of protest from various quarters, including S. B. Asia, chairman of the famous "Fourteen Taxpayers," who have consistently opposed an invasion of the general fund. Mr. Asia believes that the taxpayers of the city will never consent to a railway tax levy, which would increase the present "high taxes." Mr. Asia said:

> The municipal system is paying dividends in the form of principal and interest on the bonded debt. The system was started without any invested capital. . . . Quite likely, street car systems such as Seattle has are bound for the scrap heap. We have got to have subways and elevated railways—rapid transit—for one thing. But whatever the conditions may be, proper management makes successful business. We should turn our eyes in this direction, not toward supporting the railway by increasing taxes.

Four City Councilmen have expressed themselves as favoring Mr. Erickson's plan, but the Council is without power to act. An act by the State Legislature authorizing the Council to make a general fund levy for the railway or a vote by the people on a bond issue would be necessary if it were to be followed. One attempt was made at the last Legislature to procure legislation empowering the Council to levy at a rate of not to exceed 2 per cent for the railway department, but the proposed bill perished without being introduced.

Councilman J. T. Campbell also strongly opposes any act authorizing the Council to levy on the general fund. He declares that the railway department needs a measure empowering the Council to refund revenue bonds; that the system is suffering now because of big annual payments required on the purchase bonds. If these were lessened, the city would have money available for improvements to the system.

Mr. Erickson expresses the opinion that automobile competition has hurt all organized transportation systems to such an extent that it is now a question of higher fares or help from the general fund. Higher fares won't do, he declares, and he believes that the time is at hand when the people realize that it is better to have lower fares and make up the difference on the tax roll; "that is, if they want transportation."

A new type of billboard being installed at strategic points by the Interstate Public Service Company to boost its electric railway service between Indianapolis, Ind., and Louisville, Ky.

Special Service Aids Indiana Packers

The Union Traction Company of Indiana has appointed agents for the handling of shipments of live stock north from Indianapolis to Tipton, Kokomo, Elwood, Logansport and Peru and from Indianapolis to Anderson, Muncie, Marion and Wabash. Packers in those sections believe this special service will do much to eliminate delays and bring the stock to their plants in better condition.

Much Ado About School Tickets in Massachusetts

The proposal to repeal the law which permits school children to travel for half fare on the electric railways of Massachusetts, under consideration by the Department of Public Utilities at the direction of the Legislature, has caused a storm of protest from municipal authorities, particularly school committees. Railway officials in general merely urge a modification that will take care of abuses which have crept in since the law was placed on the statute books.

At its inception the law took in only pupils of public and parochial schools, but in recent years the privilege has been extended to cover business colleges, evening schools, Americanization schools, summer schools and other institutions. The suggestion is made by some railway officials that an age limit be fixed for the use of such tickets, but this plan is assailed on the ground that it is the high school pupil who benefits more than the younger pupil, because high schools frequently are so located that many pupils must ride to and from them. It has also been suggested that hours for the use of such tickets be limited to a reasonable time before the opening and after the closing of school. The Department of Public Utilities is preparing a report on the subject, which will be filed with the Legislature before Dec. 1.

Referendum Fails—New Rates Continue in Houston

The petition seeking a referendum on the recent increase in electric railway fares on the lines of the Houston Electric Company, Houston, Tex., was more than 1,000 names short of the required number. It was said that a checking of the list by the city showed many names not found in the city or telephone directory or poll tax list. The new rates which went into effect in the Texas city on June 13 provided for a 10-cent cash fare, four tokens for 30 cents and the weekly ticket and a 4-cent children's rate. The old rates were 7 cents cash with a 6¼-cent token rate and a 3½-cent token rate for children. The failure of the referendum petition will mean that the new rates will be continued.

P.R.T. Offers 7½-Cent Fare

A 7½-cent fare from the West Philadelphia end of the proposed Chestnut Street subway into the city center of Camden, N. J., over the Delaware River Bridge is part of the plan of the Philadelphia Rapid Transit Company, Philadelphia, Pa. This was disclosed on July 13 when three officials of the company met with the executive committee of the Delaware River Bridge Joint Commission to discuss details of the transit company's proposal to operate cars across the interstate span at the present fare rate, with toll payment of ½ cent a passenger. Ralph T. Senter, president of the railway, repeated the company's offer to advance $600,000 with which to build the line, with provision for reimbursement out of the first P.R.T. toll payment.

The commission declined to commit itself on any of the questions until its counsel could thresh out the legal ramifications in that connection. It was pointed out that Philadelphia and Pennsylvania had money available out of bridge bond issues to contribute toward the trolley line construction, but that New Jersey at present was unable to finance its share of the cost of the work.

Another "Open House Week" in Toronto

The Toronto Transportation Commission, Toronto, Canada, held its second annual "Open House Week" from July 9 to July 16. During this time the doors of the properties were open to the public to see the internal activities of the public utility. The July 9 issue of the *Coupler*, the official paper of the Toronto Transportation Commission, gave in permanent form, to those desiring, some pertinent information relating to the transportation system, which was explained verbally to the visitors at the plant.

Messrs. McCarter and Castle Slightly Injured

Thomas N. McCarter, president of the Public Service Corporation of New Jersey, and Charles C. Castle, vice-president of the American Car & Foundry Motor Company of New York, were in the hospital at Media, Pa., on July 20 recovering from injuries received in an automobile collision the day before on the Wawa Hill, Baltimore Pike, in which the McCarter car was involved. Mr. McCarter's injuries are said to consist of a broken tendon in the left hand and a cut on the forehead, while Mr. Castle received slight body bruises.

Decks Cleared for Omaha Franchise Draft

Delay has been experienced by the Corporation Counsel of Omaha, Neb., in the preparation of a franchise ordinance for the Omaha & Council Bluffs Street Railway. Before beginning work on the franchise ordinance the Corporation Counsel desired the assurance of the Guaranty Trust Company, New York, trustee for the bondholders, that pending the application for a new franchise it would not proceed with the suit which it brought in connection with the company's franchise.

Some time was consumed in obtaining from the trust company permission to give such assurance on their behalf, but it was finally obtained and the obstacle causing the delay was thus removed. The Corporation Counsel has now announced that he will proceed to draft the required ordinance.

Traffic Hazard to Be Eliminated in St. Paul

Elimination of a traffic hazard is to be made in St. Paul, Minn., by cooperation between the St. Paul City Railway and the Department of Public Works, St. Paul, with a project which will cost the company and city $10,000. At University Avenue and Prior Avenue cars of the Merriam-Mississippi line and the Hamline-South Robert line wye on to the heavy traffic street alongside the through tracks of the Minneapolis-St. Paul interurban line. The Hamline routing will be changed so the cars will not enter University Avenue, but will wye on Prior Avenue, which is to be widened by the city. A similar change may be worked out for the Merriam line on the other side of University Avenue.

Higher Fares in Effect

Increased fares went into effect in Kalamazoo, on July 7, as the result of action taken unanimously by the City Commission recently. The new fares charged by the Michigan Railroad are 10 cents for cash rides instead of 8 cents and three tokens for a quarter instead of four for a quarter. Increase in the fares was voted after the commission heard a report showing the company lost heavily last year and declaring the only alternative would be abandonment of the service for a substitute mode of transportation to be provided by the city itself.

Fare Advance Sought for Tri-City's Illinois Lines

The Tri-City Railway has announced that it will seek authority of the Illinois Commerce Commission to increase its fares on the Rock Island, Moline, Silvis and East Moline lines to a 10-cent basic rate with three tickets for a quarter. The present fare is on a 10-cent basis with fifteen tickets for $1. A 1-cent increase for children's fares to 5 cents is also being asked. The company is said to have lost $49,900 in the twelve-month period ended May 31, operating expenses being $727,897 and revenue $677,997, with no allowance made for return upon the investment of the company.

Advance in Fare Asked in Duluth

The Duluth Street Railway has petitioned the Railroad Commission of Wisconsin for increased rates in Superior, Wis. The company states that the present cash fare of 10 cents, or five tickets for 30 cents, is insufficient to produce a fair net return. The company states that during the past three years the highest return it has made on the rate base of $1,225,000, set by the commission in 1923, was 1.52 per cent. Moreover, it is confronted with extraordinary expenses incurred as a consequence of a train-street car collision.

Recent Bus Developments

Experiment with Five-Cent Fare Watched in Oswego

Many transportation exponents are fastening their eyes on Oswego, N. Y., where an independent bus company is experimenting with a 5-cent fare in the face of the traditional failure of that charge to net any kind of a fair return on a transportation venture. Even children in this city of 22,369 people are being taken care of in the Dillon scheme with a 3-cent fare. Ten 25-passenger city type buses have been provided and the routes followed are in a general way those previously served by the trolley lines of the Empire State Railroad, although headways and mileage have been to some extent curtailed.

The tale of the two interests in Oswego really dates back to April 27, 1925, when the Common Council of the city granted the application of the Mid-State Coach Lines, subsidiary of the Empire State Railroad Corporation, to operate buses over certain routes in that city. At the same time it rejected the application of James Dillon of Syracuse for a similar grant, thus ending a controversy of many months duration between the two interests for the privilege of supplying transportation service in Oswego. The Public Service Commission of the State of New York issued the necessary certificate to the Mid-State Coach Lines on Aug. 6, 1925, and service was started on Sept. 24, 1925. The Empire State Railroad Corporation had for many years operated the local railway service in the city of Oswego and the bus service was intended to serve sections which the trolley lines did not reach. A 7-cent fare was established on both the bus and the trolley lines and an interchange of transfers without extra charge was provided.

Trolley service had been conducted at a steadily increasing loss for several years and it was hoped that the installation of bus service would permit a reduction in expenses and, ultimately, the abandonment of those railway routes on which the heaviest losses had occurred and where the company was faced with the necessity of meeting the expense of paving or track reconstruction. The public did not respond to bus service to the extent that had been anticipated, and during the year 1926 there was an operating loss, ahead of taxes and interest, of $24,432 on the Oswego railway lines and a loss of $29,296 from bus operations.

The company thereupon applied to the Public Service Commission for authority to abandon its local railway service entirely, reserving the tracks used by the Syracuse-Oswego interurban line. This permission was granted on March 3, 1927, and at midnight on April 21 the cars were run into the carhouse and service was suspended. Following upon the application of the corporation to discontinue its railway service in Oswego the Dillon interests renewed their application to supply bus service in the city in accordance with their original plans which had been rejected two years before. This application was unopposed by the railway and the necessary consents were secured from the city authorities and the Public Service Commission.

Terminal in Philadelphia Neither Essential Nor Expedient

After several months study of bus terminal facilities in various cities a group of engineers engaged for such a survey by the Public Service Commission of Pennsylvania has reported to the State body that a grand central bus terminal in the heart of Philadelphia "is neither essential nor expedient."

In a report submitted to W. D. B. Ainey, chairman of the commission, in Harrisburg, the engineers declared the financial outlay involved in a central-city terminal project would be out of proportion to the value of any possible reduction in traffic congestion.

It was suggested that with the future development of the Pennsylvania Railroad terminal plans it might be possible to establish a terminal of limited capacity west of 16th Street along the line of the new Pennsylvania boulevard which will occupy Filbert Street after the "Chinese Wall" is razed.

The engineering group pointed out the possibilities of developing the plan of parking automobiles at outer terminals of trolley and bus lines and using those facilities to reach the center of the city—a system which was inaugurated and is now in operation by the Philadelphia Rapid Transit Company.

The commission itself makes no formal ruling on the proposal for a central terminal, but supports the findings of the engineers.

In its report the commission predicts that some time in the future the municipality will be a large contributing factor in the establishment and maintenance of a bus terminal.

Williamsville-Buffalo Service Proposed

The Buffalo & Williamsville Railway, which operates a single track interurban line from the north Main Street city line at Buffalo to Williamsville, has applied to the Public Service Commission for permission to operate buses from Williamsville to Buffalo. The proposed route is through Main Street from the Transit Road in the town of Amherst, Kensington Boulevard into Buffalo, with a terminus at Lafayette Square, in downtown Buffalo. Railway officials say the proposed bus line will not affect the present railway service.

Interstate Service at Duluth

The Duluth-Superior Coach Company established an interstate bus service on July 20, over the new Arrowhead bridge between Duluth, Minn., and Superior, Wis., opened for traffic the previous Saturday. The coach company, a subsidiary of the Duluth Street Railway, offers transfer privileges between its cars and buses. The bus fare will be 25 cents. Persons transferring from a car to the bus will get a 5-cent credit for their transfer, and at the end of the bus ride a transfer will be given good for passage on the street car.

The railway fare between Duluth and Superior is 18 cents, 8 cents being the Duluth rate and 10 cents the tariff in Superior. Token fares cost 7 cents in Duluth and 8 in Superior, when bought in lots of five or more. The new bus line will be operated on a half-hour schedule, with the exception of the hours between midnight and 5 a.m. The running time will be twenty minutes.

The company also operates another line, over the Great Northern Railroad's toll bridge, the sole connecting link between the cities until the Arrowhead bridge was opened.

Additional Coach Lines for Toronto Commission

Permits and effects of the White Star Transit Company and the Lake Shore Motor Bus Company have been acquired by the Toronto Transportation Commission. As a result Toronto can now boast of a bus service covering surrounding territory which is undoubtedly the equal of any on the continent. In addition to the coach routes in the city, buses of the Gray Line, as the company formed by the T.T.C. is called, will operate over all the routes covered by the absorbed companies, will maintain a service to Buffalo, and will have available a large fleet for chartering purposes. Local sightseeing buses will continue to operate under the new company.

At present the management is not contemplating any change or extension of the service over that previously maintained. When asked as to the possibility of competition with radials or steam lines, Manager Harvey is said to have replied:

> As for steam lines, they have had competition for years. But we have no intention of running in competition with the radials.

At present the only coach route in competition with radials is the Red Line to Port Credit, the only bus line on the Lake Shore route not operated by the T.T.C.

The new company is capitalized for $1,000,000. The officers are: President and general manager, D. W. Harvey, general manager of the T.T.C.; vice-president, Irving S. Fairty, counsel of the T.T.C.; treasurer, H. C. Patten, comptroller of the T.T.C. J. L. Smith will be responsible, as general superintendent, for the operation of the lines. Mr. Fairty will also act as secretary.

Service Expanded in Toledo

One of the largest bus operations yet undertaken by the Community Traction Company, Toledo, Ohio, is the service established in West Toledo on July 11, when a new 5-mile cross-town line connecting the Cherry Street car line at two points with the Long Belt line in the Auburndale district, together with a Tremainsville Road feeder extension of the Cherry Street line, was placed in operation. The new service will take care of a territory comprising about 2,500 homes hitherto not served by the company.

The City Council passed a prohibitory ordinance after DeVeaux Park and Home Acres districts were taken into the city limits, but the ordinance was fought through the courts by Sylvania Buses, Inc., an independent interurban line operating through the territory now served by the railway. The Common Pleas Court and the Court of Appeals sustained the city in its right to bar the interurban from picking up city passengers. Now Sylvania Buses, Inc., has appealed for an injunction from the Ohio Supreme Court. The Court of Appeals held that the city having the right to permit the bus line to take on passengers also had the right to withdraw the privilege.

With the working out of the new franchise based on the memoranda of agreements reached between company representatives and the Street Railway Board of Control several other new bus lines and extensions will be included in the new operating arrangement, based on exclusive handling of public transportation by the railway.

The City Council has unanimously upheld Mayor Fred J. Mery in his veto of a bus regulatory ordinance passed a few weeks ago before a settlement on franchise problems appeared likely. With the provision for an exclusive franchise for the Community Traction Company included in the new agreement the proposed bus regulatory ordinance would have interfered by the licensing of independent operators for a two years period. On advice of the Street Railway Board of Control the ordinance was vetoed and this step approved by Council.

Franchise Sought by Louisville Railway

Officials of the Louisville Railway, Louisville, Ky., have asked for a franchise enabling them to institute a bus service in conjunction with street cars. The proposal calls for a 10-cent fare, with free transfers on buses, and a 7-cent railway fare, with a 3-cent charge for a transfer to a bus.

According to President James P. Barnes the company sees in the granting of such a franchise quicker downtown service from important sections of the city and a choice for residents between street car and bus transportation.

According to the request of the tram company, all five routes would loop in the central district between Jefferson and Liberty, Third and Fifth Streets, which would be a common transfer point for all through bus service. In addition to the through lines, transfer service is contemplated, it was said, connecting the end of the Frankfort Avenue car line with the Bardstown Road line, both cars and buses, and an extension of the present cross-town bus service which operates from Portland to Parkland.

This is calculated to bring service through Hill and Burnett Streets and Pindell Avenue to Audubon Park. Transfer service also is in the plan for Broadmeade, Strathmoor and Lauderdale connecting the Bardstown Road car and the Bardstown bus line. The company suggested a modification of the routing of certain railway lines to accomplish a saving of time.

Buses are now being operated in Louisville by the Kentucky Carriers, Inc., which is affiliated with the railway.

Objects to Railway Interference

The Massachusetts Coach Company, operator of buses for hire in Boston, Milton and Quincy, Mass., has recently brought a bill in equity in the Suffolk Superior Court against the Eastern Massachusetts Street Railway to enjoin it from operating buses in competition without proper licenses. The petitioner contends that the railway is breaking the law because the license which it holds has not been approved in writing by the Mayor of Quincy, although the Quincy City Council granted a license.

Equalizing Rates on Kansas City Interurban

Bus fares between Kansas City and Excelsior Springs have been increased by the Kansas City, Clay County & St. Joseph Transit Company, controlled by the Kansas City, Clay County & St. Joseph Railway. The increase makes the fare to Liberty 50 cents instead of 45 cents. The new rate to Excelsior Springs is 90 cents, an increase of 5 cents. Proportionate increases are effective to intermediate points. It was with the idea of equalizing the fare on the interurban line and bus lines that the rate was so increased, according to Robert P. Woods, vice-president and general manager. He said the two kinds of transportation service would be tested and the type preferred by the patrons would be increased proportionately. The schedule between Liberty and Excelsior Springs has been changed to two-hour service instead of a car every hour. The plan is to utilize bus service on the off hour.

The recent purchase by the Kansas City, Clay County & St. Joseph Transit Company of the Yellow Bus System, a competing line, gives the transit company and railway line a monopoly on the transportation system in Clay County. Only a short time ago the fares on the electric railway were increased to 3 cents a mile. The old rate was 2½ cents. A new commutation book containing tickets for twenty rides at about 25 per cent reduction over the regular fare may now be purchased for use on buses or on electric railway lines.

Superior Bus Service and Sightseeing Tours in Cincinnati

A well-defined plan of efficient operation characterizes the venture of the Cincinnati Street Railway, Cincinnati, Ohio, in the recently installed de luxe bus motor coach service and sightseeing tours. A new Mack six-cylinder parlor coach, the latest in design, is being used for both of these services. The coach is equipped with 29 individual seats staggered so that all persons have unobstructed views. The de luxe line, mentioned briefly in the ELECTRIC RAILWAY JOURNAL, issue of July 16, is a no-standing passenger run from one of the exclusive residential sections of Cincinnati to Government Square, the heart of the business district. Two trips are made downtown in the morning and three returning trips in the evening. A 25-cent fare is charged. This is three times the regular railway ticket fare, but it is much lower than the cost of driving an automobile to the office. The round-trip fare of 50 cents is about the average charge for parking all day.

After the coach finishes its last morning trip to the business district, it starts directly upon the 9:30 a.m. sightseeing tour from the downtown hotels. This tour is two hours long, as is the afternoon tour, which begins at 2 p.m. Both trips are different, so that patrons of the morning trip are prospects for the afternoon ride. When the coach completes its afternoon sightseeing run it is down in the business district, where it can start at once on its return runs of the de luxe service. The equipment is, therefore, used for a full day of business and has two different kinds of service to support it.

One dollar per trip is charged for the sightseeing tours. Reservations are handled by hotel porters in the same way that Pullman reservations are handled by these porters. Three downtown hotels, the Sinton, the Gibson and the Metropole, were chosen for loading points. Three University of Cincinnati students have been trained as guides and they are proving that the guide is one of the most important elements in making the tours popular. The out-of-town visitor is pleased when he is received as a guest who is visiting the guide's home town rather than as a rubberneck.

Along with these special runs which have been added to the Cincinnati Street Railway motor coach service in the past few weeks is an extension of regular motor service to the Coney Island Amusement Park. This resort is about 9 miles from the center of the city. In the past it has been reached mainly by steamers, but people could go there by transferring to an interurban line. The new motor coach line gives speedy service on a basic 45-minute headway. Coaches are added without limit as travel to the park justifies.

Sale of Washington-Virginia Line Confirmed

The sale of the properties of the Washington-Virginia Railway, which took place at public auction on May 10, has been confirmed by a decree of the Circuit Court, entered by Judge Samuel G. Brent at Fairfax Courthouse. The total price paid for the road and equipment was $575,000.

The Mount Vernon division, which extends from Washington to Mount Vernon, through Alexandria, was purchased by Lewis H. Parsons, Philadelphia, for the protective committee of the bondholders of the road, for $300,000, while the Falls Church division was sold to John McMullin of Philadelphia for $150,000, he representing the bondholders of that division. The equipment, which was sold separately, was purchased by John Wyne, also of Philadelphia. The price was $125,000.

Plans are already being made to rehabilitate part of the road. As a step in that direction the State Corporation Commission has approved the charter for the Arlington-Fairfax Railway, backed by citizens of Arlington and Fairfax Counties, which plans to take over the Falls Church division.

Park Property at Lynchburg Sold

The Lynchburg Traction & Light Company, Lynchburg, Va., has announced the sale of the old Rivermont Park to D. W. Persinger, Roanoke, at a price reported to have been $100,000. The property came into the hands of the original Rivermont Street Railway during the '80s, but became the property of the traction and light company in 1894. It was operated by the railway as a park and amusement resort until about fifteen years ago, when the development of moving picture theaters rendered it obsolete. The property is located 2½ miles from the center of the city.

Deficit in Toledo in June

Operations of the Community Traction Company, Toledo, Ohio, for June resulted in a deficit of $34,424 to the fare stabilizing fund, bringing the total deficit to $1,037,379. Passenger revenue continued to decline, showing $264,738, compared with $274,569 in June last year. Total railway operating revenue was $258,454, of which $196,783 was required for operating expense, with $17,416 set aside for taxes, leaving a gross income of $44,255. There were 3,522,497 revenue passengers. They paid an average fare of 7.037 cents and were carried at an average cost, including taxes, of 6.081 cents. This was before capital charges and sinking fund payments.

The co-ordinated bus and street car operation in June of this year amounted to 607,859 coach and car miles, a gain of about 9 per cent.

Revenue collected from bus operation was $16,846, while other special bus operation added $3,872. There was a deficit of $418 after deducting operating expenses and proper share of taxes. In this operation 207,004 revenue passengers were handled at an average fare of 8.138 cents. The cost per passenger was 10.211 cents.

Lake Shore Reports Deficit for 1926 Operation

The gross earnings of the Lake Shore Electric Railway System, Cleveland, Ohio, for the year ended Dec. 31, 1926, were $3,253,558, against $3,199,762 for the year ended Dec. 31, 1925. After the consideration of operating expenses, taxes and interest payments the year's operation was concluded with a deficit of $13,309, against a surplus in 1925 of $105,092. These figures, which were given in the 26th annual report of the company, include operation of the Lake Shore Electric Railway, the Lorain Street Railroad, the Sandusky, Fremont & Southern Railway and the Lake Erie Power & Light Company. Separate figures on the railway operation are given in the accompanying statements. During the year 5,500 ft. of new track with 100-lb. rail on concrete foundation was laid in East Main Street, Norwalk. The second track across the new concrete bridge at Fremont was completed and placed in service. The storeroom building at the Sandusky shops was completed and placed in use early in the year, all material and supplies being centered at that location. Three old passenger cars were rebuilt and made

into freight motor cars. Twenty standard electric freight trail cars were purchased from American Car & Foundry Company and placed in service.

STATEMENT OF CAPITAL EXPENDITURES

Lake Shore Electric Railway	$181,502
Lorain Street Railroad	10,351
Sandusky, Fremont & Southern Railway	32,794

Expenditures for additions and improvements charged to capital account are shown in the accompanying table.

First Preferred Dividend of New Grand Rapids Company

At a meeting of the board of directors of the Grand Rapids Railroad, Grand Rapids, Mich., formerly the Grand Rapids Railway, on July 19 it was voted to pay the initial quarterly dividend of $1.75 per share on preferred stock on Aug. 1 to stockholders of record July 21. This is the first dividend by this property on the preferred stock since 1918. Its declaration follows the recent recasting of the financial structure of the company.

Court Authorizes Bond Interest Payment by Chicago Railways

Regular semi-annual interest on the first mortgage bonds of the Chicago Railways, amounting to $1,391,375, and due on Aug. 1, will be paid at that time by virtue of an order issued on July 19 by Federal Judge James H. Wilkerson.

South Shore Seeks to Abandon Track in East Chicago

Authority to discontinue local street car service between Chicago Avenue and Guthrie Street, in the city of East Chicago, Ind., was asked on July 9 in a petition filed with the Indiana Public Service Commission by the Chicago, South Shore & South Bend Railroad.

Operations over this 2-mile branch, which connects the main line of the railroad with a populous industrial section known as Indiana Harbor, was suspended in July, 1926, when the main line electrical overhead system was converted from 6,600 volts to 1,500 volts d.c. It is proposed to remove the tracks at once.

A marked preference among residents of the territory served for motor coach service furnished by the Shore Line Motor Coach Company, a subsidiary of the South Line, together with the excessive cost of reelectrifying and reconditioning the line are advanced in the railroad's petition as reasons which militate against a resumption of service.

More Illinois Power & Light Stock for Customers

On July 1 the Illinois Power & Light Corporation, Chicago, Ill., made available to its customers and stockholders some additional shares of its 6 per cent cumulative preferred stock, at $92 per share yielding 6.32 per cent. Plans are in effect which call for the disposal of all these shares in the Illinois territory during the month of July.

Representatives of the investment department and employees have been forwarded advertising literature for distribution among the stockholders and others interested and an elaborate campaign of newspaper advertising is planned to assist in promoting the sale of stock.

Decorative posters printed in two colors were distributed and have been placed in the regular frames and other prominent places on the various properties calling the attention of the public to the issue. Other advertising material includes an "offering circular," a four-page circular in two colors and a bill insert. In announcing the sale of the additional shares the company said in part:

It has always been the desire of Illinois Power & Light Corporation to operate on a partnership basis with its customers. When capital for extensions and additions to the property can be partially provided through the issuance of stock, the company prefers to sell the preferred shares to the people who use our service. It is better for us and better for the customers to have them as partners in this business.

NET INCOME HIGHER.—For the twelve months period ended June 30, 1927, the total operating revenue for the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., was $46,710,592, against $44,840,968 for a similar period ended June 30, 1926. The total operating expenses increased from $29,220,839 to $30,388,173. After the consideration of income deductions, the net income for the twelve months period ended June 30, 1927, amounted to $6,354,280, against $5,762,358 for the twelve months period ended June of last year.

INDIANAPOLIS & CINCINNATI CASE CARRIED OVER.—Settlement of the Indianapolis & Cincinnati Traction Company foreclosure suit and other claims, involving $2,000,000, will go over to the September term of the Circuit Court at Rushville, Ind., the court having closed for the summer vacation with no decree being entered in the matter.

STEAM RAILROAD AFTER COAL BELT ELECTRIC.—The Missour Pacific Railroad on July 8, asked the Interstate Commerce Commission for authority to acquire 10 miles of line from Marion to Herrin, Ill., now operated by the Coal Belt Electric Railway.

SEEKS TO DISCONTINUE LINE.—W. H. Lines, vice-president of the Portland Electric Power Company, recently asked the City Council of Portland, Ore., to permit a discontinuance of the Brooklyn carline effective June 26. This is the date that was set for the installation of bus service on the Powell Valley line. The new service as proposed would entail a few adjustments on the bridge line along Grand Avenue.

ABANDONMENT ON THREE LINES ALLOWED.—The Pacific Electric Railway, Los Angeles, has been authorized by the California Railroad Commission to abandon service and remove tracks in the city of Redlands on three lines.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

H. H. Fryling Made Claims Attorney for Public Service

Henry H. Fryling, counsel to the claim department of the Public Service Corporation of New Jersey, has been named to succeed Judge Joseph Coult as claims attorney for Public Service companies, which include the Public Service Railway and the Public Service Transportation Company. Mr. Coult resigned to take up the practice of law with David Satz under the firm name of Coult & Satz.

Mr. Fryling is a native of Essex County. He lives in South Orange. He studied law in Newark and was admitted to the bar in February, 1897, as an attorney and three years later as a counsellor-at-law. He carried on a general practice in Newark since his admission to the bar and until he came to Public Service on May 1, 1921.

As trial attorney he has tried cases for Public Service subsidiaries in every county of the state in which they operate. On Jan. 1, 1926, he succeeded Leonard J. Tynan as counsel to the claim department, continuing since, however, to try cases in the Essex County courts. As counsel to the claim department he had charge of all appeals to the Supreme Court and Court of Errors and Appeals.

J. T. Hambleton to Manage New Bus Company

Joseph T. Hambleton has resigned as general manager of the Hartford & Springfield Coach Company, the successor to the Hartford & Springfield Street Railway, Warehouse Point, Conn. He also has resigned as general manager of the Springfield Bus Terminal Company, Springfield, Mass., with a bus terminal on Worthington Street, Springfield, built under his direction. Mr. Hambleton's plans are not definite, but it is believed he will go to Easton, Pa., to manage a new bus company.

Mr. Hambleton began his electric railway experience in Allentown, Pa., in 1894, serving the Lehigh Valley Transit Company's lines in various capacities for several years. In 1900 he became superintendent of construction for the Bethlehem Construction Company, having charge of the work on the Dayton, Springfield & Urbana Railway and other routes. At this time he built the Slate Belt Transit Company line, first operated by the Lehigh Valley System. From 1911 to 1916 Mr. Hambleton was general manager of the Wilmington Southern Traction Company. Gaining control of the Slate Belt Transit Company in 1916, he was made president and general manager, with headquarters at Pen Argyl, Pa. He was appointed general manager of the Hartford & Springfield Street Railway in July, 1923. A. C. Marshall, vice-president of the Hartford & Springfield Coach Company, is temporarily directing the operations of the company.

Joseph Bowes Filling Responsible Position at El Paso

Joseph Bowes, as manager of the El Paso Electric Company, El Paso, Tex., is applying the practical knowledge and experience he gained during many years service with the Stone & Webster utility companies. He recently resigned at Lake Charles, La., where he had been general manager of the Gulf States Utilities Company. Under his management the Louisiana properties passed through a period of growth and expansion.

Mr. Bowes began working for Stone

Joseph Bowes

& Webster in 1909. He was first employed as superintendent of operations of the light and power department of the Tacoma Railway & Power Company, Tacoma, Wash. In 1916 he joined forces with the Southwestern district, when he was sent to Port Arthur as general superintendent. Seven years later he was made general superintendent of the Eastern Texas Electric Company and transferred to Beaumont. When the property at Lake Charles was purchased in 1924 Mr. Bowes was chosen as manager. In June, 1926, the Lake Charles property was consolidated with those which now comprise the Gulf States Utilities Company, Louisiana division, and he became general manager in charge of all operations in Louisiana.

Mr. Bowes was born in Washington, D. C., in 1885. He was graduated from Cornell as electrical engineer in 1907.

D. N. Dunlop, director of the British Electrical and Allied Manufacturers Association, has been appointed British representative on the permanent committee on electrical questions set up by the advisory and technical committee of the League of Nations.

Newspaper Man to Handle Publicity at Jacksonville

Herbert Bayer, considered one of the best reporters in the State of Florida, has entered the electric railway field as publicity and advertising director for the Jacksonville Traction Company, Jacksonville, Fla., a newly created position. His retention by the railway coincides with a branching out of the company into new fields of endeavor in acquainting the public with news of its operation and problems. In his new work Mr. Bayer will conduct research work for data to be used for stories for technical magazines. He will also edit the employees' magazine and "Trollicar Topics," a pamphlet distributed through the street cars. Here he will have the opportunity to enliven the company's publications with stories of human interest concerning employees and operation and develop general news of the railway.

Mr. Bayer has worked on daily papers of Jacksonville for many years. He has been affiliated with the Jacksonville *Journal* and the Florida *Times-Union*. His new connection necessitated his resignation from the editorial staff of the Florida *Times-Union*.

James H. Miller of Rochester has been named superintendent of the Pontiac city lines of the Detroit United Railways, Detroit, Mich. He succeeds Frank W. Davis. He was formerly connected with the Detroit United Railway in Detroit.

C. F. Hewitt, formerly with the Peter Smith Heater Company, Detroit, Mich., has recently been appointed staff engineer of the Department of Street Railways at Detroit, Mich., under Del A. Smith, general manager. Mr. Hewitt has long been connected with electric railway work, having served among other properties the Des Moines City Railway and the United Traction Company, Albany, N. Y.

T. U. Fairlie, Toronto, Ont., identified with electric railway and radial developments in the so-called border cities of Canada for several years, has resigned from the Ontario Hydro-Electric Power Commission to enter the brokerage business in Toronto with J. F. H. Ussher.

W. P. Johnston, formerly manager of the Inland Empire electric lines out of Spokane, Wash., prior to the sale of the system to the Great Northern Railway, has been made secretary and general manager of the Red Collar Steamboat Company, operating on Lake Cœur d'Alene and the St. Joe River.

James Dalrymple, until recently general manager of Corporation Tramways in Glasgow, Scotland, has returned from his South American expedition. By request of the authorities concerned he has carried out an investigation of tramway problems in Sao Paulo and Rio de Janeiro. As a result private reports have been presented to the authorities in both cities.

OBITUARY

Col. W. A. Gaston

Colonel William A. Gaston, prominent lawyer and banker of Boston, thrice Democratic candidate for the Governorship of Massachusetts and in 1922 unsuccessful rival of Henry Cabot Lodge for Lodge's seat in the United States Senate, died on July 17 at his country estate, Killingly Farm, at Barre, Mass. His age was 68.

In 1887, when it was sought to form the West End Street Railway from separate companies then operating in and about Boston, Colonel Gaston was chosen by the financial interests to carry out the proposed reorganization of what was afterward the Boston Elevated Railway. He put the elevated on a business basis, reduced the fares, improved the service and created *esprit de corps* among its employees by bettering the conditions under which they worked. Among the things he did was provide a system of promotion for merit and start a policy of insurance against accident for the workers. He also laid down the rule, since followed by the Elevated, that all large contracts should be awarded in the open market after being freely advertised in open competition.

In 1904 he returned to the practice of law and in May, 1907, became president of the National Shawmut Bank. Failures were of daily occurrence at that time. Despite the remonstrance of some of his directors, Colonel Gaston sent out a circular letter to every bank and trust company in the country that had business dealings with the Shawmut, urging them to extend the maturing notes of merchants and thereby avoid forcing failures and help the serious mercantile situation by bringing about an earlier restoration of confidence.

The Gastons are descended from a French Huguenot family which fled from France to Scotland under the leadership of Jean Gaston in the seventeenth century and later emigrated to America. A grandson of Jean Gaston, born in County Antrim, Ireland, came to this country between 1720 and 1730 and was the original American ancestor of Colonel Gaston. William Gaston, the colonel's father, was twice Mayor of Boston, served in both houses of the Legislature and became Governor of Massachusetts in 1875.

Colonel Gaston began his education in a private school conducted originally by Laban Beecher for the education of his own children. Subsequently he attended the Washington Grammar School, Roxbury, and the Roxbury Latin School. At Harvard he numbered among his classmates, besides the future President Roosevelt, Robert Winsor, head of the banking house of Kidder, Peabody & Company; the late Robert Bacon, partner in the Morgan banking firm of New York and Ambassador to France; Richard Saltonstall and Joseph Quincy.

After graduating, he spent two years in the Harvard Law School and was admitted to the Suffolk bar in 1883. He entered the office of his father's firm, Gaston & Whitney, and showed conspicuous ability in court and in the management of large estates. In 1890 Frederick E. Snow was taken into the partnership and remained with William A. Gaston after former Governor Gaston retired. Richard Saltonstall, Colonel Gaston's classmate, entered the firm several years later.

Colonel Gaston as a young man excelled in sparring, wrestling, baseball and running, and became the middleweight champion boxer of Harvard. The story of how he defeated the redoubtable Ramon Guiteras in three ten-minute rounds, with a future President of the United States for his second, is a Harvard saga.

F. S. Elgin

Frank S. Elgin, member of the board of directors of the Memphis Street Railway, Memphis, Tenn., and co-receiver with T. H. Tutwiler for the railway and the Consolidated Gas & Electric Company during the period of those receiverships in 1920-22, is dead.

Mr. Elgin was 54 years old. He came prominently before the public about 25 years ago when he was appointed by the late President Roosevelt as the United States Marshal at Memphis. He served in that capacity for about seven years and later as standing master in chancery.

When Mr. Elgin gave up the office of marshal, about seventeen years ago, he entered upon the practice of law. He received during the later years of his life recognition through the appointment to a number of receiverships, notable among these being that for the William R. Moore Dry Goods Company in addition to those for the local railway.

Mr. Elgin in December of last year gave up the active practice of his profession in Memphis and went to California, hoping the mild climate there would help him in his efforts to restore his health.

A. B. Brown

Alexander Beal Brown, general representative of the air brake department of the Canadian Westinghouse Company, Ltd., died at his home in Montreal, Que., on June 8, 1927.

Mr. Brown was born on June 6, 1873, in Scranton, Pa. After he completed his education in the public schools of his home city in 1887 he entered the employ of the Delaware, Lackawanna & Western Railroad as an apprentice in the machine shop, and, upon finishing his apprenticeship, he was transferred to the air brake inspection department and made assistant to the air brake inspection foreman. He remained in this position until in 1897 he was offered an appointment by the Westinghouse Air Brake Company as an assistant on the Westinghouse Air Brake instruction car, which he promptly accepted. He was subsequently made inspector with the Air Brake Company at Buffalo, where he remained until 1903, when he was transferred to Hamilton, Canada, to act in a similar capacity with the Canadian Westinghouse Company, making his headquarters in Montreal, Que. He afterward was appointed general representative of the air brake department of that company.

Frank F. Gilmore, Jr.

Frank F. Gilmore, Jr., 43 years of age, manager of the Louisville Safety Council, which is strongly supported by all the utilities in Louisville, died on July 14.

Mr. Gilmore was born in Louisville, and was graduated from the Louisville Male High School. He was advertising representative of a number of publications from 1902 to 1917. He then became advertising manager of *Kentucky Farming* and later advertising manager of the *Southern Agriculturist*. For a time he was with the Morgan-Robinson Advertising Agency. He went with the Safety Council as manager in November, 1923.

Jay B. Odell, a vice-president and director of the Western Electric Company, died on July 8 in the New Rochelle, N. Y., hospital following an operation for appendicitis. Mr. Odell was born in Iowa Falls, Iowa, 44 years ago. He was graduated from Cornell University in 1904. Immediately following his graduation he entered the employ of the Western Electric Company in New York, later going to the Chicago works of the company at Hawthorne. In 1924 he became assistant to the president of the Western Electric and in January, 1926, was elected a vice-president of the company in charge of purchasing and traffic, the post he occupied at the time of his death.

Howard A. Clouser, assistant claim agent of the Northern Ohio Power & Light Company, Akron, Ohio, for the last six years, died recently. He was a graduate of Central High School and an Akron University student. He handled court cases for the company, and was studying law during his spare hours.

Edward Beadle, Sr., of Cranford, N. J., died at his residence there on July 8. Mr. Beadle in early life was engaged in the manufacture of street railway supplies. He was born in New York 82 years ago.

Duncan A. Smith, well known in railway circles in New York City, died recently at his home in Jamaica. Twenty-five years ago Mr. Smith was appointed to the New York & Queens County Railway at its plant at Woodside. Later he had charge of the plant at Cedar Manor. He continued with the company until about the time Gen. Lincoln C. Andrews was appointed by the court to the post of receiver of the railway. Mr. Smith was 60 years old.

Manufactures and the Markets

St. Louis Car Gets San Francisco Order

The ten new cars authorized by the San Francisco supervisors for the San Francisco Municipal Railway, San Francisco, Cal., will be ordered at once and may be ready for service on the Judah Street line and the Duboce tunnel route by the latter part of the year.

These cars will be built by the St. Louis Car Company under the terms of the old contract, which was made elastic. Fifteen cars have been delivered under this contract, entered into last November, and are now in service.

The only major change in the new cars over those purchased under a former contract will be in the construction of the trucks. They will be made by the J. G. Brill Company, Philadelphia, instead of the Standard Steel Car Company, Newcastle, Pa. The reason given for this change is that the Brill trucks come more nearly up to specifications. Westinghouse motors will be installed. All cars in use on the Municipal Railway are of semi-steel construction. They are known as the California type.

$22,282,300 Subway Contract Awarded

The Board of Transportation, New York City, awarded on June 4 to the Mason-Hangar Company, Inc., the contract for the Fulton Street route of the city's new subway system at its bid price of $22,282,309.75, the lowest of seven bids received on May 18. The contract calls for the construction of both an extensive stretch of subway and a tunnel under the East River, from Church Street and Park Place, Manhattan, by way of Fulton Street to Nassau and Jay Streets, Brooklyn.

The Fulton Street tunnel will be the first connecting link between Manhattan and Brooklyn in the city's new subway system. The contract is the second under-river tunnel contract awarded by the Board of Transportation, the other being for construction of the 53d Street tunnel under Welfare Island to Long Island City, from which the Queens subway to Jamaica and the Brooklyn crosstown subway through Greenpoint and the Eastern District of Brooklyn will branch out.

125 Peter Witt Cars Ordered by Detroit Railways

An order for 125 new street cars of the Peter Witt type equipped with rattan seats has been placed by the Department of Street Railways of the City of Detroit with the Cummings Car & Coach Company of Chicago. Proposals were asked by the city for leasing to the municipal department a number of street cars with an option of purchasing and bids were received from the St. Louis Car Company, Cummings Car & Coach Company, J. G. Brill Company and the Cincinnati Car Company and opened on July 14.

As drawn the contract provides for an initial payment of $250,000 at the time of its execution and $18,000 per month starting Aug. 1, 1927, to July 1, 1937, inclusive, thus distributing the payments over a ten-year period. The Cummings company will begin delivery of the cars in 90 days and continue at the average rate of eight cars per week until all cars are delivered.

The contract covering the transaction of the purchase of the cars was certified by the Detroit corporation council, and, together with the escrow agreement among the municipal street railway department, the Cummings company and the Guardian Trust Company of Detroit, received the approval of the City Council.

The purchase of the new cars was requested in anticipation of the transportation rush expected to follow increased activity at the Ford motor plant.

A New Era Ahead for Europe

Geneva and Stockholm meetings point way to rehabilitation. Germany making rapid progress

THE rehabilitation of Europe through the world Economic Conference at Geneva and the recent meeting of the International Chamber of Commerce at Stockholm is seen as now on the way to accomplishment by Edward J. Mehren, vice-president and chairman of the editorial board of the McGraw-Hill Publishing Company, Inc., who has just returned from Europe. He went abroad to attend the Geneva and Stockholm sessions and to study industrial conditions in Italy and Germany.

At Stockholm leading business men of the world, meeting in the International Chamber of Commerce, took steps to put into effect the conclusions of the International Economic Conference held at Geneva in May. The Geneva conference for the first time gave the world a clear picture of Europe's economic ills and of the necessary remedies. The international chamber approved the Geneva conclusions and called upon its national committees, organized in the several countries, to urge their respective governments to pass the legislation necessary to make the conclusions effective. The votes of the delegations were a virtual pledge that they would bring such pressure to bear on their governments. The conclusions relate chiefly to steps for the removal of trade barriers. According to Mr. Mehren, the chamber's organization will follow up its national committees to help secure the desired result. Geneva and Stockholm, therefore, may well mark a turning point in European affairs, the advent of a new era.

As Mr. Mehren sees it, continental Europe has made good strides in recovery, but further progress is impeded by the trade barriers everywhere erected. Trade is lagging. Unemployment is large and living standards are below those of pre-war times. Early help is needed. Therefore the importance of the Geneva and Stockholm meetings.

In commenting on Germany's progress toward recovery, Mr. Mehren said that it has been noteworthy. He thus summarized the situation there:

There is an enthusiasm, an intelligence and an energy among Germany's industrial leaders that is astonishing and inspiring. Every means for reducing production costs is being intensively studied. Her handicaps will prevent her from being at once as formidable a rival in foreign trade as she was before the war, but eventually her ability to produce cheaply and well will challenge the industrial genius of every other land. We in America can hold our place in the future competition with her only by the same means she is employing—hard work and thorough and extensive scientific and industrial research.

For us in the United States the lesson would seem to be this: Just now the competition of Germany will not have serious concern for the American people at large, but as our need for foreign markets grows and Germany's handicaps are reduced German competition will be of deep concern to us. Let it not be looked forward to as commercial or industrial warfare. It is but the competition that we as Americans expect among ourselves; to the most intelligent, the most efficient shall go the reward. So, too, in the future competition in foreign trade. Germany will be a worthy rival; the tools of competition will be the research laboratory, studies in waste reduction, researches to discover new methods and new products, and, finally, hard and intelligent work. We are stimulating Germany now to high endeavor in engineering enterprise and industrial management. She will, in turn, stimulate us. Our future position as against Germany will depend on our technical ability and commercial alertness.

With the convention still 2½ months away the American Electric Railway Association reports

STATEMENT OF SALES AND EARNINGS OF THE GENERAL ELECTRIC COMPANY FOR SIX MONTHS

	1927	1926
Net sales billed	$149,795,026	$147,450,867
Less: Cost of sales billed, including operating, maintenance and depreciation charges, reserves and provision for all taxes	130,930,258	131,191,460
Net income from sales	$18,864,768	$16,259,407
Other income, less interest paid and sundry charges	4,965,393	3,811,516
Profit available for dividends	$23,830,162	$20,070,923
Less: Cash dividends on special stock	1,287,190	1,070,530
Profit available for dividends on common stock (7,211,481 84/100 shares issued)	$22,542,972	$19,000,392

Details of General Electric Sales for Six Months

General Electric Company sales billed for the first six months of 1927 amounted to $149,795,026, compared with $147,450,867 for the corresponding period last year. Profit available for dividends on common stock for the six months of 1927 was $22,542,972, compared with $19,000,392 for the similar six months last year.

The profit available for common stock is equivalent to $3.13 per share in 1927 and $2.63 per share in 1926.

American Car & Foundry Net Earnings Fall

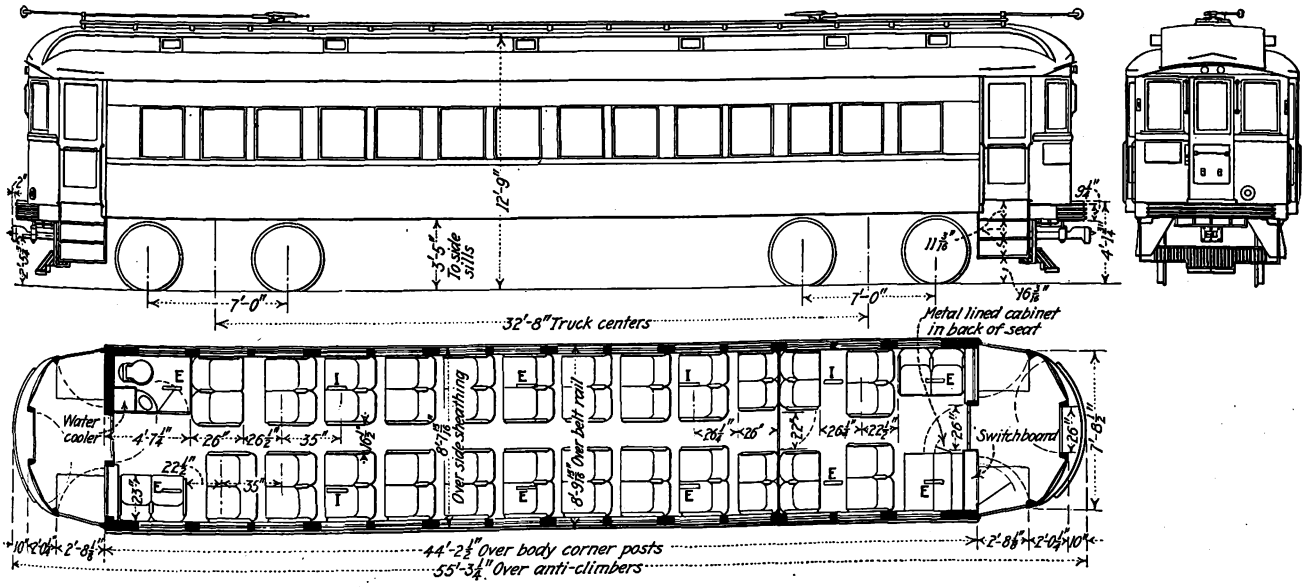
Net earnings of the American Car & Foundry Company and its wholly owned subsidiaries for the year ended April 30, 1927, fell short of the amount necessary for the payment of the $6 per share dividend on the no-par-value common shares. W. H. Woodin, president, said:

In view, however, of the company's sound financial condition, the directors felt that the surplus might with safety and propriety be drawn upon for such difference. This accordingly has been done, and the reserve for dividends on the common stock remains intact.

The wholly owned subsidiaries of the company are American Car & Foundry Securities Corporation and American Car & Foundry Export Company.

Consolidated operating income, after making provisions for taxes, for the year was $7,837,528, a decrease of $1,437,044, and net income, available for dividends, was $4,593,377, a decrease of $1,509,521. After allowing for $2,100,000 for dividends on the company's 7 per cent preferred stock, the amount remaining for the common stock fell short by $1,106,623 of the required

Fifteen De Luxe Cars for C., A. & E. Scheduled for Delivery Aug. 1



Plan and elevation of one of fifteen interurban semi-steel cars which the Chicago, Aurora & Elgin Railroad will shortly operate on its Fox River Valley line. This is said to be a departure in de luxe unit construction

Aug. 1 is the date now set for delivery of the fifteen new type de luxe interurban cars to be introduced by the Chicago, Aurora & Elgin Railroad, Chicago, Ill., as the result of an order placed Jan. 1 with the Cincinnati Car Company, Cincinnati, Ohio.

The new rolling stock will be of semi-steel, instead of all-steel, construction as previously announced by ELECTRIC RAILWAY JOURNAL in its issue of Feb. 5. Each unit will cost $39,000 and is to be equipped with a combination straight and automatic air brake system, plush seats and toilet and smoking car compartments. An interior finish of mahogany, exterior color scheme of maroon and Baldwin equalizing bar trucks are some of the refinements. The units will have a total weight of 102,000 lb. and are to be equipped with four General Electric inside hung motors, rated in an earlier statement at 150 hp. Accommodations for 54 seated passengers have been specified. The western suburbs of Chicago and the Fox River Valley line of the company will be served by these units, the first specifications for which have just been released by the Cincinnati Car Company.

Number of units	15
Type of unit	Two-man, motor, passenger, interurban, double end, double truck
Number of seats	54
Builder of car body	Cincinnati Car Co.
City and state	Cincinnati, Ohio
Date of order	Jan. 1, 1927
Date of delivery	Aug. 1, 1927
Weight, total	102,000 lb.
Bolster centers	32 ft. 8 in.
Length over all	55 ft. 3¼ in.
Length over body posts	44 ft. 2½ in.
Truck wheelbase	7 ft. 0 in.
Width over all	8 ft. 11 in.
Height, rail to trolley base	13 ft. 0 in.
Window post spacing	35 in.
Body	Semi-steel
Roof	Monitor
Doors	End, swinging
Air brakes	Westinghouse AMU
Armature bearings	Plain
Axles	5½-in. x 10-in. heat-treated steel
Car signal system	Consolidated
Compressors	Westinghouse D-3-F
Conduit	Metal
Control	General Electric type M
Couplers	Ohio Brass Form 19
Curtain fixtures	Morton Manufacturing Company
Curtain material	Pantasote
Destination signs	Hunter
Finish	Paint
Floor covering	Linoleum and rubber
Gears and pinions	General Electric grade M
Glass	Plate
Hand brakes	Peacock
Heat-insulating material	Salamander
Heaters	Railway Utility
Headlights	Portable
Headlining	Steel
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Safety Car Heating & Lighting Co.
Motors	Four General Electric, inside hung
Painting scheme	Maroon
Roof material	Canvas and wood
Sash fixtures	Curtain Supply Company brass
Seats	Hale-Kilburn No. 900
Seat spacing	35 in.
Seating material	Plush with leather trim
Slack adjusters	Smith-Ward shim
Steps	Stationary
Step treads	Irving Steel Works
Trolley retrievers	Knutson No. 5
Trolley base	U. S. 20-C
Trolley wheels	Moccasin, 6 in.
Trucks	Baldwin equalizing bar type
Ventilators	Railway Utility Company
Wheels	Rolled steel, 37 in. diameter
Wheelguards	Steel pilots
Special devices	32-volt multiple lighting with 175-amp.-hr. battery charged by motor-generator set

Digitized by Google

amount to pay the $6 dividend on the common stock, which amounts to $3,600,000 annually.

The report, while not naming the J. G. Brill Company directly, which is controlled through the Brill Corporation of Delaware by American Car & Foundry, indicates the management expects to be highly successful in the motor car and bus building field. The report says:

Purchases by the railroads of new freight car equipment during the year have been in disappointingly small volume.

Naturally, this inactivity in buying brought with it a competition even more keen than usual among car building concerns bidding for the business offered, with the result that the profit margin, none too broad at the best, was still further narrowed.

The report then makes its reference to the Brill activities as follows:

The company is developing a field for its activities and the utilization of its experience and facilities more varied than that offered by the building of freight and passenger cars of the ordinary type, but nevertheless lying within the general domain of transportation and therefore calling for no departure from the underlying purposes of the company's organization. This particular field of endeavor is the manufacture and sale of automotive vehicles, buses, trucks and motor-driven rail cars—instrumentalities the development of which as supplementary to the service given by the established steam and electric railways will undoubtedly solve many of the problems which have long confronted railroad management in various sections of the country.

Copper, Lead and Zinc Prices Advance

The week ended July 20 has been unusually active in copper, zinc and lead; consumers have bought tin in good volume; China and India both have bought silver; and without exception prices for each of these metals are higher than a week ago. Antimony, quicksilver and platinum continue dull, with little change in price.

Copper has continued its upward course, begun three weeks ago, with a further increase in the volume of business, which was the best for seven weeks. On July 20 prices ranged from 12.80 to 12⅞ cents. Sellers seem confident that buyers are in need of metal for early requirements, and in this view they are supported by the fact that the great bulk of the recent business has been for August delivery. A factor in the strength of the domestic market is the unusually active buying abroad, done during the last week at the fixed price of 13 cents c.i.f. Germany is the outstanding customer, but France and Great Britain have participated. Standard copper has advanced sharply in London.

On July 20 the American Smelting & Refining Company advanced its contract price for New York lead from 6.20 to 6.30 cents following a week of excellent business in the lead market and an advance of almost a pound sterling in the London quotations.

The London zinc market, as in the case of copper and lead, has stiffened during the week and buying in the domestic market has been active, with prices advancing from day to day. Part of the buying was of a speculative character, but galvanizers and brass manufacturers also bought. Quotations for high-grade zinc for prompt delivery in New York continue nominally at 8 cents per pound.

The tin market has been active, as has the market for the other metals. Prices, however, show little change, having ruled around 64 cents for prompt Straits most of the week.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	July 19, 1927
Copper, electrolytic, cents per lb.	12.53
Copper wire, cents per lb.	14.50
Lead, cents per lb.	6.21
Zinc, cents per lb.	6.55
Tin, Straits, cents per lb.	63.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.275

ROLLING STOCK

Iowa Southern Utilities Company, Centerville, Iowa, has ordered three more Mack city type buses. They will be 25-passenger, four-cylinder buses, 196-in. wheelbase.

TRACK AND LINE

Philadelphia, Pa.—A low bid of $7,269,880, made by a New York firm, was offered on July 19 for the extension of the South Broad Street subway, Philadelphia. The bid was $143,000 lower than the offer made by the contractors who built much of the nearly completed North Broad Street tube. This firm offered its bid under the name of the Keystone State Corporation, the new title of the company. Patrick McGovern, Inc., the firm which built the North Broad Street subway from Clearfield Street north, was underbid by the New York firm by $687,000. Director Ehlers said he would take the six bids offered under consideration. Under the terms of the contract, the tube from City Hall to a point between Lombard and Kater Streets must be ready for tracklaying by Aug. 1, 1929, allowing two years for construction. It must be ready for operation by Feb. 1, 1930. The contracts for station construction, tracklaying, electrical equipment and plumbing work are separate from the tube construction contract.

TRADE NOTES

Stevens & Wood, Inc., engineers and constructors, 120 Broadway, New York City, have been retained by the Board of Transportation of the city of New York to study, investigate and report on the method to be adopted to provide electric power for the operation of the new municipally owned independent rapid transit lines.

G. E. Ackerman has accepted a position with the Chicago sales department of the Electric Service Supplies Company, Philadelphia, Pa. He will handle railway lighting and industrial business in the state of Indiana and southern Michigan. Mr. Ackerman was formerly connected with the International Cash Register Company and the Line Material Company.

Big Three Welding & Equipment Company, Fort Worth and Houston, Tex., Texas and Oklahoma distributor for "Stagle-Arc" welders, manufactured by the Lincoln Electric Company, Cleveland, Ohio, announces the opening of its third warehouse branch at No. 1 North Frankford Street, Tulsa, Okla.

R. P. Dunmire, formerly connected with the Westinghouse Electric & Manufacturing Company for eighteen years, in the insulator and high-tension department, and later district manager of the Erie Malleable Iron Company, is now engaged as insulator specialist for the Electric Service Supplies Company, Philadelphia, Pa.

H. E. Palmer has recently joined the sales force of the Electric Service Supplies Company, Philadelphia, Pa. Mr. Palmer's former connections included several years in construction work with the Development & Machine Company, the Philadelphia Electric Company's supply department and the Erie Malleable Iron Company. Mr. Palmer will cover the states of Maryland, District of Columbia, Virginia and West Virginia.

ADVERTISING LITERATURE

Copperweld Steel Company, Rankin, Pa., recently issued another insert for its looseleaf binder for engineering data, "Copperweld." The new sheets deal with overhead construction materials.

General Electric Company, Schenectady, N. Y., is adding to its loose-leaf advertising folders the following sheets: GE squirrel-cage motors, 500 series; CR3204 drum-type control equipment; type MT control equipments for d.c. series-wound crane hoist motors CR4422-A4 and CR4422-L4; hand starting compensators CR1034-K17, K-21 and K-22 dead-front cabinet type; CR-9511 shoe-type solenoid brakes for direct-current motors; automatic switching equipment with 600-volt synchronous motor-generators in railway service and CR1034-K1 hand starting compensators for squirrel-cage induction motors.

Are New York's Transportation Troubles Merely Postponed?

NEW YORK CITY will not experience a strike on the lines of the Interborough Rapid Transit Company at this time. The future, however, is not so certain. It is a situation bedeviled with politics, personal animosity and chicanery. And out of it most anything is likely to come. A spade should be called a spade. The Amalgamated is hunting big game. It did so last August and lost, but that has only whetted its appetite. It will not hesitate again to make the men its catspaw if it thinks it can achieve its ends. However good the record of that organization elsewhere, the recollection of New Yorkers of the previous machinations of that body does not bode well for the future with it in the saddle. The New York newspapers realized this and they emphasized in unmistakable terms the fact that the public's memory was sufficiently acute to go back twelve months.

There is little doubt that the proselyting activities of the union among the Interborough employees were encouraged when Samuel Untermyer, as special counsel for the Transit Commission in that body's investigation into the possibilities of unification of the local lines, made a violent and apparently irrelevant attack upon the present labor policy of the company. The work that the Mayor did at the eleventh hour in averting the strike nullified some of the harm Mr. Untermyer did, but more than action of this kind, expedient as it was, is needed to deal constructively with this situation. The Mayor is an astute politician. That is shown by his binding the Amalgamated officers to promise that, so far as it was in their power, they would not raise the issue of union organization until the city's plan of unification is completed. This was a master stroke so far as the attenuated political promise is concerned. It implies everything and says nothing at the same time. On the other hand, President Hedley of the Interborough was a little too direct. He presented his case to the Mayor powerfully by letter, but was content with that. He would undoubtedly have strengthened public sympathy for his company had he gone in person to the City Hall and confuted the pretensions of the labor leaders. This he could have done very effectively since he was reinforced with figures to show that the employees were content with present conditions, that only recently their wages had been advanced and that an economic barrier is fixed irrevocably upon the operating companies by the limitation of the 5-cent fare.

This last, in fact, is the nub of the whole matter. There has been a gross lack of appreciation on the part of the municipal authorities of the transportation needs of the city and the efforts of the management to fulfill those needs. With anything like adequate co-operation between the city authorities and the transportation officials rapid transit conditions could be greatly improved in the interests of the public. Such co-operation on the part of the city has not been forthcoming. The management has gone far in its efforts to treat its employees fairly and to give the best possible service under existing conditions. The primary trouble with the New York situation is not with the railway management; it is politics, petty and unusually partisan.

Short Cycles for Signal Lights Speed Traffic

REGULATION of traffic by means of signal lights has progressed so rapidly of late that keen interest exists today in questions that were unheard of a few years ago. In this category is the matter of the proper duration of the cycle of operation. Although great diversity exists in the timing of the signals now in use, opinions of close students of traffic problems generally favor the short cycle.

On Fifth Avenue, New York City, where the original installation of these signals was made, a long cycle is still used, 120 seconds being allowed for through traffic and 60 seconds for cross movement with no appreciable "dead" intervals, making a total of 180 seconds. Atlantic City uses an even longer cycle; 150 seconds for through traffic and 90 seconds for cross movement, or a total of 240 seconds. Cycles ranging from 70 to 125 seconds are common. On the other hand, the cycle of operation for many of the signals in Chicago is less than 50 seconds. Cincinnati, New Orleans, San Antonio and Duluth are other cities where cycles of less than one minute duration are used.

Experience in Atlanta demonstrated that a 63-second cycle was notably more efficient than cycles of 115 and 78 seconds, which were tried first. Similarly, when signals were first installed in Cincinnati they were operated on the synchronous principle with a 90-second cycle. They were then changed to the alternating or wave plan with the same cycle of operation. This failed to show much improvement and the cycle was therefore shortened to 50 seconds. This has proved satisfactory for both automobile and street car traffic.

The type of signal control has an important bearing on the length of the cycle. With synchronous control it is necessary to have a comparatively long cycle to permit travel for a reasonable distance between stops. Otherwise much valuable time would be lost stopping and starting, even though the proportionate duration of red and green lights was the same. With the usual type of alternating or wave control, sometimes called the "platoon" system, it is necessary to allow equal periods for through and cross traffic. This again results in a long cycle. A recent development is a plan whereby alternate groups of lights would be operated on separate circuits. Such an arrangement would make it possible to have different periods for cross and through traffic and consequently a shorter cycle of operation. With co-ordinated control the length of cycle has a definite relation to the speed of vehicular movement. Often,

Digitized by Google

however, either of two cycles can be used for practically the same speed. On Michigan Boulevard in Chicago, for example, it was found that either a 60-second cycle or a 100-second cycle could be operated satisfactorily, but there was no intermediate length that would serve nearly so well.

Experience shows that short cycles giving frequent changes cause a minimum of interference to vehicular movement and are to be preferred to the longer cycle except where the traffic is extremely dense. Since it is apparent that the usual type of synchronous control is not well suited to produce this result, more widespread use of alternating or co-ordinated control is required to expedite traffic movement.

"As a Man Thinketh in His Own Heart—"

FOREMAN training, or what might better be termed supervisory training, is growing by leaps and bounds. Industry after industry is seeking a better understanding of its merits. It has been given consideration at annual gatherings of street railway men and it will be further developed at the A.E.R.A. convention next October.

Like every other movement for good, it has suffered by not being thoroughly understood. First and foremost, its object is not to educate in the sense in which education is accepted today. To explain this assertion, one turns to that powerful critique of modern education, Dean Martin's "The Meaning of a Liberal Education."

In discussing liberal education vs. propaganda, he writes:

> Although the educator and the propagandist are both concerned with the dissemination of information, they have nothing else in common. They use contrary methods and they strive for opposite goals. The propagandist is interested in what people think, the educator in how they think.

The first, explains Mr. Martin, "strives for effect, the latter for an open mind." This latter objective is what the true exponent of foreman training desires. It is the goal which few companies have reached, because they have employed a propagandist method instead of that of the true educator. Foreman training as set up in most industries has as its base a certain "primer" dealing with the various administrative situations which required expert supervision. If the group is taught this by rote, experience has proved that this is propaganda, a studied effort—quickly recognized by the pupils—to convert the group to a straitjacket "you-must-do" method of supervision that ignores the human equation. Quite the reverse is true if the "primer" is employed—sometimes only casually referred to—to cause individual thinking and expression; a rationalization of essentials to the exigencies of separate situations, in order that the main objective may be reached in accordance with the best methods of the industry. This definition is difficult to understand unless one sits in on a "real" foreman conference and hears the result of what might be called "self-starter" questions.

The responses are amazing. Bill, who has always appeared to be a plodding personage, suddenly launches forth a counter question, presents a situation, analyzes a method, that jars his instructor and confrères and makes the "primer" look sick. Bill is thinking about a mutual problem in a different manner and he often proves that what is sauce for the goose may not be sauce for the gander.

And again, foreman training cannot be launched in a hurry. Those who "put it over" must undergo long training. Their employers must have as their goal education and not propaganda—not converts but thinkers. And so experience has shown that the supervisory training should start at the top; that is, with presidents, vice-presidents, general managers, etc. In order thoroughly to permeate the organization it should take the downward course. Incidentally the writer has known of cases where the highest officers first scoffed and then remained to wonder, sweeping aside other problems in order to attend the classes regularly.

With this experience to guide it and two months ahead in which to pick the men who will attend the conference at Cleveland, the industry should do some serious thinking on this question. Foreman training cannot be put aside, because it has conclusively proved its worth and it is one of the great forward steps for super industry. Like marriage, it must be undertaken "advisedly." Those who promote the classes must remember that "as a man thinketh in his own heart so is he." A parrot may learn, but he doesn't think.

It Takes More Than Merely Being Right

IT STANDS to reason that the electric railways' case must be sound before progress can be made in obtaining a favorable verdict on any one of the many points upon which public officials must be approached. But whether the point at issue is rate of fare, paving, franchise terms, taxes or what not, it is not sufficient merely to be right.

"Public officials are responsive to their bosses, the people," said an executive recently in speaking before a gathering of railway men. He went on to explain that it is hard to understand that though public officials will sometimes agree frankly that the railway is entirely justified in what it seeks, they will at the same time do nothing to grant the company's contention.

There is a tendency to condemn the man in public office for his lack of backbone; for his subservience to the public he represents. It does not suffice to convince city or regulatory officials that the railway's case is sound. The public—their bosses—are the seat of final authority and the railway executive can accomplish little until he has made relief for the railway popular instead of unpopular in the public mind. Regardless of whether or not this situation is as it should be, the fact remains that under present conditions the public official, particularly in municipal affairs, is very responsive to what he thinks is popular or unpopular with his constituents, and on his ability to win support for his action depends the tenure of his office.

Something of the other fellow's viewpoint is needed to avoid disheartenment at what seems a very unfair situation. After all, the average railway manager also seeks the good will of those who employ him. His action in a given situation is not always entirely in accord with his own personal views. He is subject to the opinion of his own bosses, and he doesn't act in opposition to their views very long.

Is it, then, impossible to win that co-operation which the average railway needs so badly? Not at all. It may seem like a long road, but the industry cannot reasonably expect to overcome in a year or two the effects of its sins of omission and commission during a decade. True, there are some public officials who are grossly unfair. There are some who are inclined to suck the last drop of

Digitized by Google

vitality from their railway in the misguided effort to keep alive an issue on which so many of them and their predecessors have ridden into office in the past.

There is only one way out. That is the path of service. The public is not interested in other peoples' troubles—even when they are those of a vital public servant. Public interest must be won by improvements that will appeal to the average man on the street. Public confidence can follow only an adequate demonstration of good faith. Expertly planned publicity through many available channels must follow, not precede, the other steps and must be used to reach the public mind and impress upon it the facts. When all these things are done adequately enough and are persisted in long enough, the public can be "sold" on its railway. Then and then only can a full measure of co-operation from public officials be expected. Then the railway is in position to speak on a footing of equality, as one public servant to another. Then the railway may demand what in too many cases at present it requests—action in the interest of the public and the community welfare.

Germany Makes a Contribution to the Science of Electric Railway Statistics

ONE of the most important steps ever taken to improve the scientific operation of electric railways was the adoption of a standard classification of accounts. This classification enables the results of any road to be compared with those of another with the assurance that both have been compiled on the same basis.

The same argument holds for the use of a standard classification of statistical data, but here it insures not only the same basis for the statistics but it brings about a uniformity in the data prepared. Otherwise, some companies would make public one set of figures, and others another set, and it would be impossible to compare the properties in all particulars.

Operators in America who have felt the need for greater standardization in statistical data will be interested to know that such a classification has been used for some time in Germany. The suggester of this classification, Dr. Mattersdorf, manager Hamburg Elevated Railway, is well fitted for the task as he is not only a skilled operator and engineer but was a pioneer in and has always been an ardent advocate of scientific methods in the analysis of electric railway statistics.

While many foreign annual reports, including the British, make a feature of the inclusion with the financial figures of pertinent data on operation, the publication of corresponding figures in the annual reports of American electric railway companies is rare. In this respect electric railways differ from the steam railroads in this country, which usually include in their annual reports several pages giving tons of freight of different kinds carried, types of locomotives, and similar matter.

In electric railway printed reports, a commendable increase of financial information is being published, particularly in regard to the details of operating expenses. The time is past when one line of type was considered adequate to give to operating expenses, though three or four pages might be taken up with the balance sheet. Further improvements in the way of better annual reports could well be made in giving the stockholders a table of the principal statistical averages from operation, by which they can more easily make performance comparisons with other properties of a like size operating under similar conditions. For such as desire to work along these lines, Dr. Mattersdorf's list of statistics may offer helpful suggestions.

European Car Advertising More Diversified but Less Efficient than Ours

INSTRUCTION as well as entertainment will be found in H. Samuelsen's report on "The Sale of Advertising Space" on continental tramways, published elsewhere in this issue. Even those whose acquaintance with European trolleys is confined to flashes at the moving-picture theaters know that advertisements are carried outside the cars in a profusion undreamt of in publicity-proud America. However, few of us realize that the foreign tramways seem ambitious to plaster every available area with an appeal to buy this or that.

It seems to us in America that one of the reasons in Europe for going beyond the ceiling and bulkhead car cards and the dasher spaces usual here is a lack of appreciation as to how to make advertising most effective. Mr. Samuelsen's paper indicates that even the majority of the systems, which use professional advertising agencies, indulge in this orgy of diversity.

American experience has proved that the first essentials of advertising success are concentration and attractive copy, with its frequent change. An inside advertisement tends to receive the concentrated and favorable attention of the rider when he is seated and can look at cards large enough to be read with ease. He will be less favorable toward an article advertised on a car strap or on a seat shield that cuts into the small of his back.

A step riser is hardly a safe place for an advertisement. If the advertisement is novel enough to be read it may be distracting enough to cause an accident. This was appreciated by one of our rapid transit companies in rearranging the advertising in its stations recently. Instead of permitting advertisements to be placed wherever space offered, the company took care to keep them away from stairways or other places where distraction would be a hazard.

Too many kinds of advertising spaces defeat the objective of maximum revenue, aside from the question of safety first. Just as plenty of white space around an advertisement enhances its value, so does a car card or platform dasher gain if there are not too many other varieties of publicity in competition.

The second essential, attractive copy and its frequent change, depends partly upon standardization of card and placard sizes and partly on extent of circulation. In this respect America is far ahead of continental Europe, largely because car advertising here is handled on a national scale. Quantity production not only permits a national advertiser to save on art and printing costs, but also makes it possible for the local florist, hatter or confectioner to use highly attractive cards arranged to take his imprint. Nothing like this has been developed on the Continent, where the same article is advertised through scores of small agencies or by home talent.

Finally, it is apparent from Mr. Samuelsen's complaints that his property was driven to handle advertising direct because there was no agency whose sole medium is the electric railway. Such a complaint would be impossible in America and Great Britain, where car and railway structure advertising has been built up scientifically by agencies which make no use of any other medium.

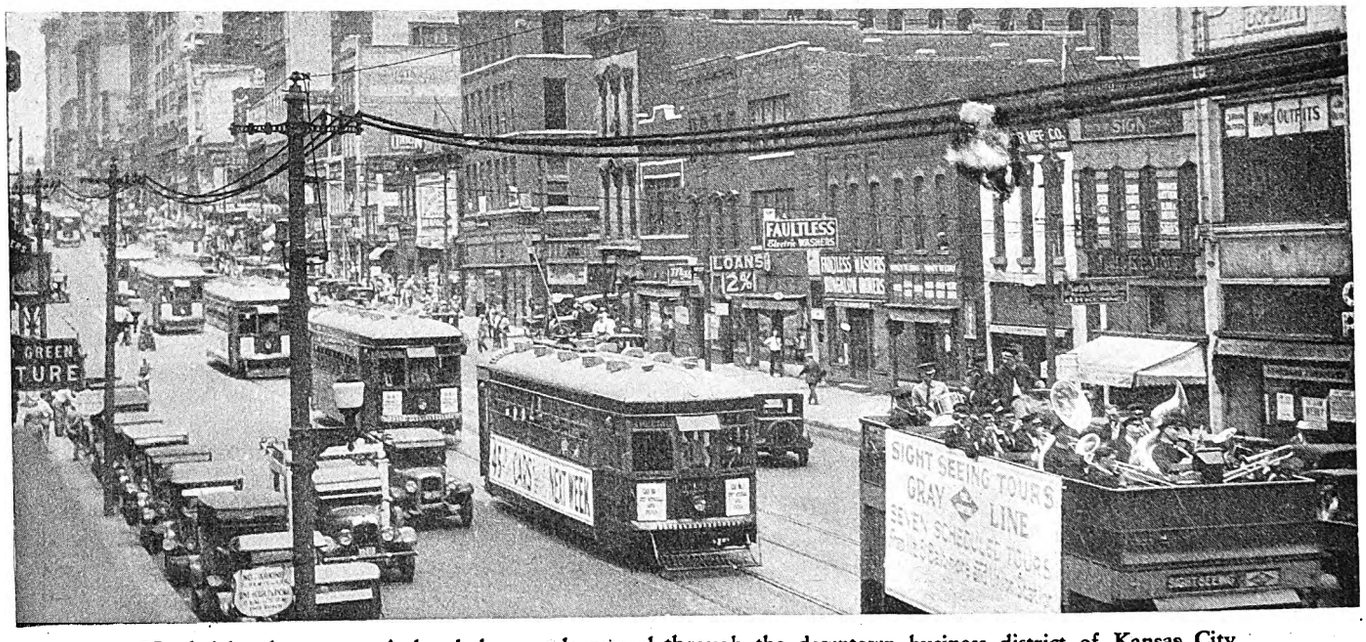
Kansas City

Meets the Silk Urge

Extensive car modernization program was introduced to the public by a parade of seventeen of the remodeled cars, headed by the company's band atop a double-deck coach. A million and a half dollars will be spent in the remodeling program



Headed by the company's band the parade moved through the downtown business district of Kansas City

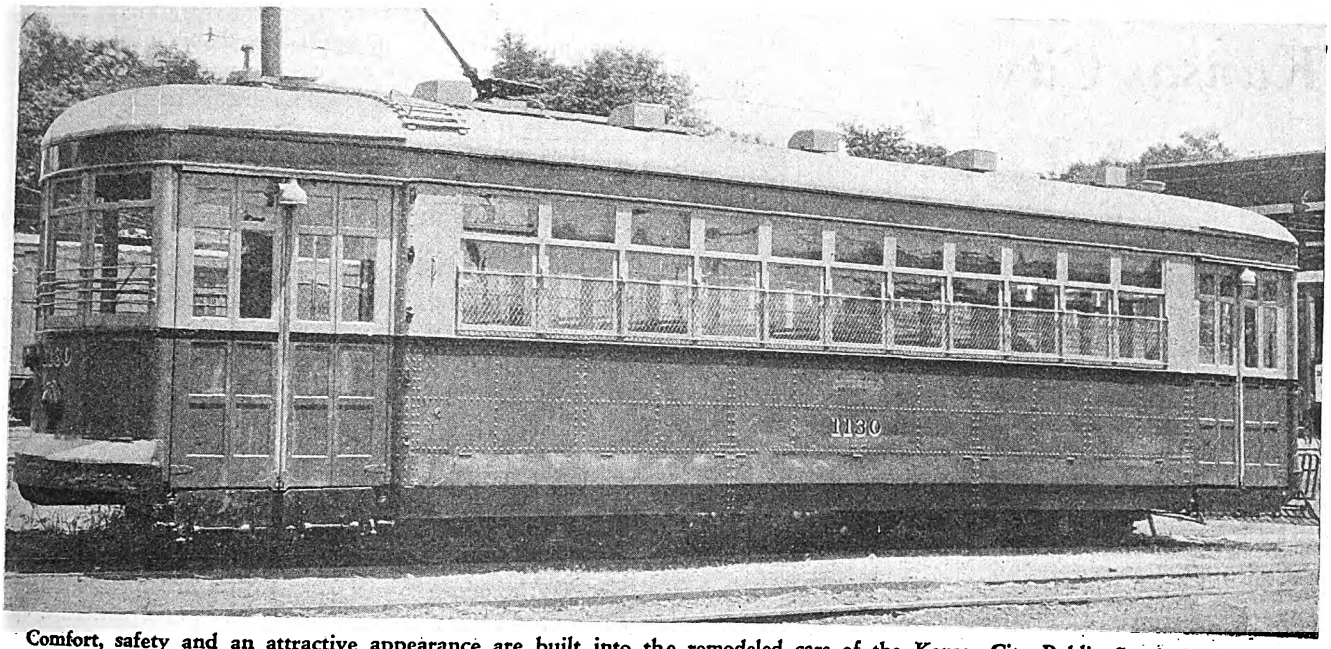
WHEN the car rehabilitation program of the Kansas City Public Service Company is completed early next year, 746 cars will be completely remodeled at a cost of approximately $1,500,000. These cars are being equipped with many new features to attract car riders. For color a real fruit combination scheme of plum with apricot shading on an orange background, as submitted by the Municipal Art Commission, has been adopted.

Through the local newspapers and in display advertisements, the public has been hearing about these modernized cars for some time. The first seventeen were completed during the first week in July, and were introduced to the public in a parade through the city. City officials, newspaper editors, club presidents, and important local personages filled the seventeen cars, and the public lined the streets to get a first glimpse of the cars it had been hearing so much about. A band composed of employees of the Kansas City Public Service Company atop a double-deck coach headed the procession. During the afternoon and the day following several of the cars were placed on sidings at various locations and the public was invited to inspect them. Instructors were placed in charge of each car to explain novel features, and 150,000 pamphlets were distributed that gave brief information of the features included in the modernized cars, a brief summary of the reconstruction program that will be carried out, together with suggestions for passengers for using the new service to best advantage.

One of the biggest handicaps under which the new company is working is the haphazard layout due to ownership of the original lines by competing companies. The Kansas City Public Service Company now serves a district with an area of 98 square miles with 318 miles of track. For several years the number of revenue passengers has been decreasing steadily, and during 1926 11,000,000 less revenue passengers were carried than in 1922. Emerging from a long receivership last October, the new owners found the property run down and in need of repairs. Many miles of track needed replacement, cars needed overhauling, viaducts had to be built and buildings improved. It is estimated that approximately $6,000,000 will be needed to put the property in first-class condition. An extensive rehabilitation program was started, and at the end of 1927 approximately 27 miles of track will have been rebuilt, many buildings remodeled, and the car rehabilitation program started.

The new cars are being remodeled at the Tenth and Lister Streets shops, and many interesting construction details are included in the first 45 which already have been turned out. Particular attention has been devoted to making the interiors comfortable and attractive. Linoleum tile flooring cemented to a base of builder's

Digitized by Google



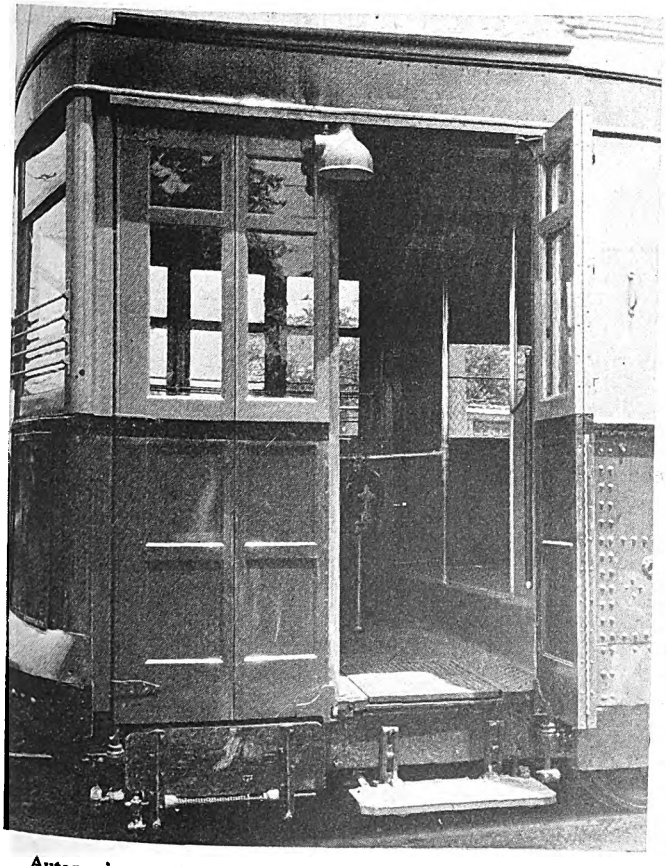
Comfort, safety and an attractive appearance are built into the remodeled cars of the Kansas City Public Service Company

felt and canvas covers the floor except the aisle, where a strip of flexible composition matting is laid. Vestibules have a metal insert rubber matting. This not only adds to the attractive appearance of the cars, but facilitates cleaning and will minimize accidents from slipping and falling. Seats are upholstered with maroon Kemi-suede placed over a felt padding. This material gives a much more sightly and comfortable seat than rattan and can be cleaned easily, and is less apt to tear clothing. Aluminum seat-end brackets are placed on longitudinal seats to prevent passengers sliding off when the car is being accelerated or retarded.

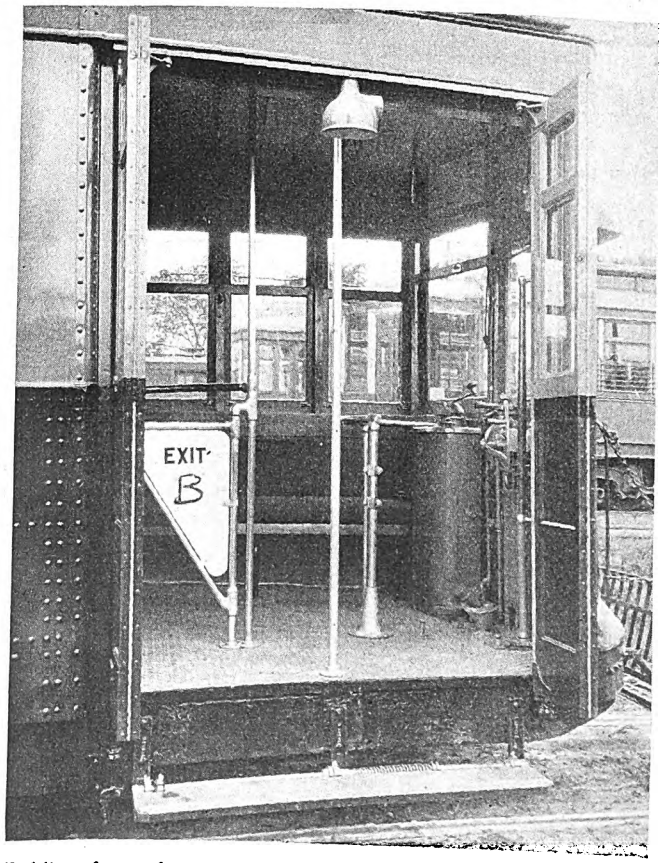
Frosted lamps will be used in the lighting system. There is a row of lighting fixtures directly over the center line of each row of seats. The 36-watt lamps used provide increased illumination and better light distribution than the previous arrangement, and also add to the appearance of the interior.

Sanitary rigid hand straps are provided for standees. The movement of these handstraps is crosswise of the car but they are held rigid against forward and backward movement.

On the exterior a low, rakish appearance which is now so popular in car construction is being produced

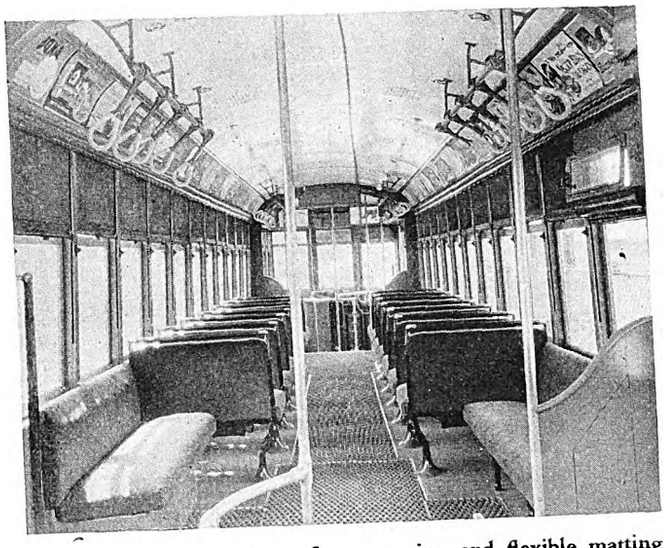


Automatic treadle controlled door is used for the rear exit and speeds passenger movement



Folding front doors give passengers more convenient boarding and alighting facilities

Digitized by Google



Upholstered seats, linoleum floor covering and flexible matting in the aisles add to the interior attractiveness

through the addition of skirts. These are constructed of Celotex, which is used because of its light weight and insulation qualities. The skirts are in sections so that they can be swung back for repairs, and are held in position by spring catches. Through this installation and the painting adopted a streamline effect is produced. A metal visor or sun shield adds to the appearance of the car.

The total width of entrance and exit doors has been increased. Folding front doors are used and both doors operate at the same time. The pneumatic door engines are controlled from the engineer's valve, or from a street faretaker's valve accessible from the outside. Treadle control is installed for the rear exit door. These changes provide increased schedule speed as there is less interference between streams of boarding and alighting passengers, so shorter length stops result. Improved air-brake and air door control *include the latest safety car devices.*

The improved controller equipment includes line breakers to open the motor circuits underneath the car. New K-35 controllers replace K-14 previously used. In addition to the increased protection from arcing and control failures this equipment should result in reduced maintenance. Equipment operating the control and air brakes from the rear of single-end cars has been installed.

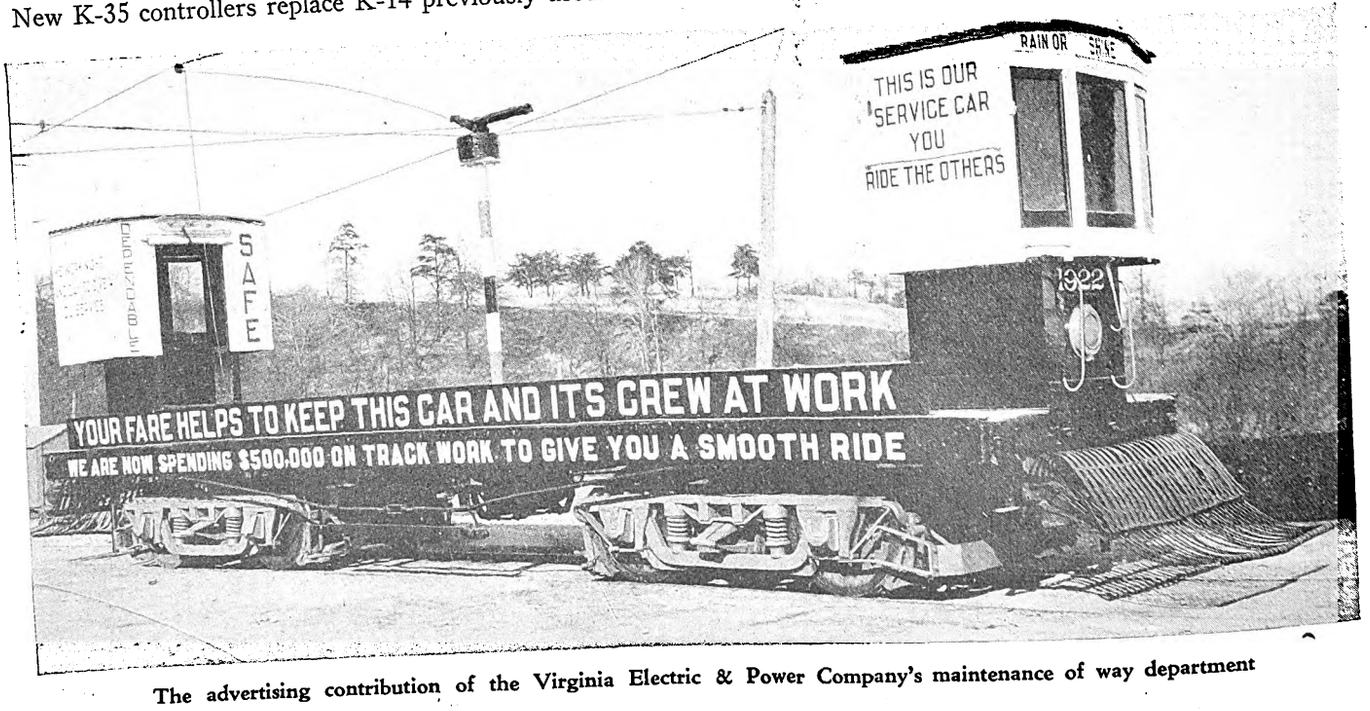
Some of the additional equipment which has been added includes thermostatic control for the heaters, late type intake and discharge ventilators, and air rectifiers to prevent freezing of air piping during winter weather.

The interior and exterior color schemes were submitted by the Municipal Art Commission after several colors had been tried out and commented on by the public. The general color scheme is orange and apricot trimmed with plum. The outside numerals are plum with apricot shading on an orange background. The lower part of the car body below the arm rail and the letterboard between the upper side and roof are orange, while the sash and posts from the arm rail to the letterboard are apricot. A narrow band of plum color is used on the molding. Plum trimming is also used on the nose irons of the front and rear vestibule. Skirts are painted orange to match the car body with a broad band of plum color around the bottom. The roofs are painted a light gray. The interior finish is a drab green below the arm rail and a slightly lighter shade of drab green above. The headlining is white.

Richmond Service Cars Act as Publicity Agents

SERVICE cars of the Virginia Electric & Power Company of Richmond, Va., are playing a dual rôle for the company in acting as advertising and publicity agents in addition to performing their regular service duties. Brightly painted and bearing numerous slogans and statements they make a striking appearance, certain of attracting the public's eye.

The cabs of each car are painted white and bear statements such as: "This is our service car—you ride the others," "We work night and day to give you service," and "Rain or shine—service." The body of the car is painted a very dark red and bears statements extending its full length calling attention to the importance of the maintenance work. These will be seen in the illustration.



The advertising contribution of the Virginia Electric & Power Company's maintenance of way department

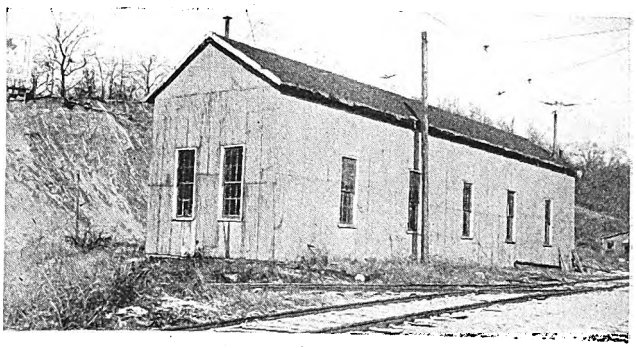
Goes After Business

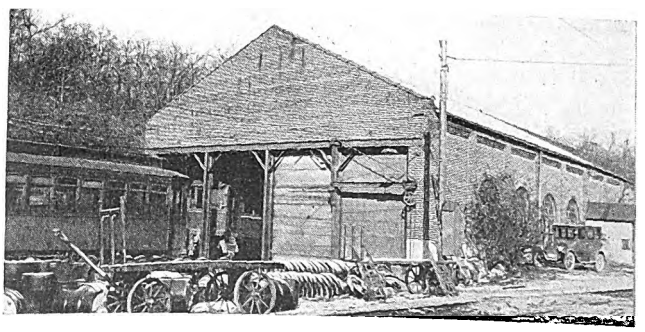
Increased passenger and freight revenue follow improvements in facilities. Track rehabilitation, new power system, new freight rolling stock and enlarged terminals pave the way for active business-getting campaign

This is the third and final article on the rehabilitation of the Cincinnati, Hamilton & Dayton Railway. The previous articles, appearing in the issues for July 16 and 23, covered the new policy of the property, the financial reorganization, history, and the new passenger equipment.

EVERY indication points toward success of the effort to build both passenger and freight revenues on the Cincinnati, Hamilton & Dayton Railway to a point where sufficient income will be obtained to show not only an attractive return on the new money put into the property, but also a substantial recovery for the securities that accepted a junior position in order to make the rehabilitation of the property possible. The methods used are discussed in the following paragraphs.

During the period from 1921 to 1926, consistent efforts made by the receiver to build freight revenues resulted in an increase of 104 per cent for the six-year period. During the first five months of 1927, while the rehabilitation was being pushed forward vigorously, a further increase of 31.2 per cent was made in comparison with the corresponding period of the previous year. This gratifying result was made possible by first providing adequate facilities to handle freight properly when it was offered, and then by an active effort to sell business for the road. Of the 40 new standard C.E.R.A. box trail cars that were purchased, fifteen were obtained in December, 1926, and 25 in January and February, 1927. The freight terminal at Cumminsville, in the outskirts of Cincinnati, was improved and enlarged with proper track facilities. This work was done in January, 1927. In February of this year the C., H. & D. put into service two extensions from its main line right of way into the Delco-Frigidaire plant of the General Motors Corporation. Over the southernmost of these extensions the company handles inbound freight and also provides special tripper service mornings and evenings for transporting workmen to and from the plant. The westernmost of the extensions gives access to the delivery end of the plant, in which identical facilities are provided as regards location for the C., H. & D. and the Big Four Railroad. Although the construction work necessary involved a considerable expenditure, from three





A study in contrasts on the Cincinnati, Hamilton & Dayton Railway

The old, inadequate and run-down shops have been replaced by a large concrete and steel building of most modern construction.

to sixteen carloads of freight are moving out of this plant over the C., H. & D. every day, as the result of the enterprise displayed in building the spur.

The new management of the C., H. & D. has not been content merely to handle the freight brought to it. Shortly after the organization of the new company Richard

Digitized by Google

Breckenridge came with it as vice-president in charge of traffic. For many years he had been traffic manager of the Chicago, Aurora & Elgin Railroad and was largely responsible for the upbuilding of the freight business of that property when the same interests that now control the C., H. & D were in charge. Mr. Breckenridge opened offices in the Dixie Terminal Building in Cincinnati and an active campaign for solicitation of freight from that city was begun shortly. In addition C. M. Byrne, who was retained as traffic manager with offices in Dayton, was made responsible for the active solicitation of freight on the northern end of the line.

Within a few days the company will open a down-

ure approximately only 85 per cent of that in 1921. On the division from Hamilton to Cincinnati the showing was even worse. Here the passenger revenue in 1925 was only 67 per cent of that in 1921. The valiant effort made by the receiver to improve service by rehabilitation of track and improvement of the power supply enabled the Dayton to Hamilton division to beat down the bus competition that had existed between these two points. Competition was practically eliminated on this division as the result of improvements made in service on the railway, even before the present general rehabilitation program was completed. The increase in passenger revenue of 20 per cent in the city service at the Dayton end of the

Rehabilitation has changed the C., H. & D. from a grass-grown streak of rust to an efficient transportation property

1 and 2—Looking north on private right-of-way entering Overpeck—before and after

7—A stretch of double track on private right-of-way between Miamisburg and West Carrollton after rehabilitation

town freight depot in the Cincinnati terminal warehouse in the heart of the wholesale district, from where less-than-carload shipments will be hauled by motor truck to the company's freight terminal at Cumminsville, in the outskirts of Cincinnati. It is believed by the company that this down-town terminal, together with the active and aggressive solicitation of freight in Cincinnati, will lead to a substantial increase in the volume of business moving into and out of the city.

In addition to this the company has greatly increased its business through a contract with the Universal Forwarding Company by which extensive freight facilities were provided for that shipper in Cincinnati and interchange through rates were established by the C., H. & D. with connecting carriers to the large shipping centers in the Central Electric Railway Association territory, such as Cincinnati, Detroit, Cleveland, Toledo and Mansfield. This alone has added from six to nine carloads of freight per day in and out of Cincinnati.

Interurban passenger revenues on the section of line between Dayton and Hamilton fell off by 1925 to a fig-

line during the first six weeks of operation of the new cars, as outlined in the JOURNAL last week, augurs well for the general result on this division, now that the new interurban as well as the city cars have finally been put in service.

Due to the fact that the Cincinnati terminus of the line is 5 miles from Fountain Square in the heart of the city, bus competition still exists on the division between Hamilton and Cincinnati. There are two improved hard surface roads between the terminals on this division. One of them runs parallel to the C., H. & D. tracks. Although the bus line paralleling the railway over this road has been in the hands of a receiver two or three times in the last three or four years, it still continues to operate, and according to the railway management has been responsible for the serious drop in revenues on this division. Railway passenger revenues between Cincinnati and Hamilton during 1926 were 5 per cent lower than in 1925, and were only 61 per cent of what they had been in 1921.

Now that new equipment is available, faster schedules

Digitized by Google

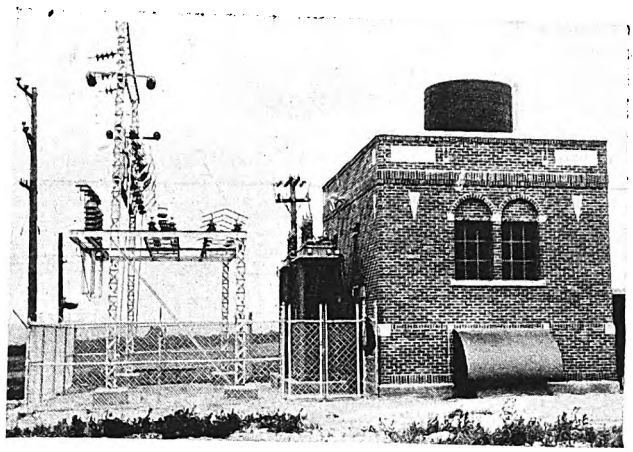
will put the railway in a better position to win back this lost riding. Service on the southern division has been increased so that there is a car every 30 minutes instead of once an hour as heretofore. Buses are operated by the railway from Fountain Square to its Cincinnati terminus. These meet every train so as to take passengers to the heart of the city. It is anticipated that the bus competitors, who have been losing money in their operations while at the same time depleting the railway revenues, will find it impossible to continue in the face of the improved railway service that is being offered. The net result is expected to show a decided improvement in the railway passenger revenues on this division.

Track Improvements

When the new management took charge of the property, considerable track rehabilitation work had already been done. Under the receivership which extended from November, 1920, to March, 1926, ties over the entire system had been replaced. On a stretch of track some 6 miles long, between Franklin and Middletown, old 60-lb. rail was replaced with 85-lb. section. New gravel ballast was put in at points where it was most needed, and nearly all special work on the property was renewed. Approximately $350,000 was spent on rehabilitation work during the receivership, most of it going into track.

During the past year, 2.4 miles of city track on Pleasant Avenue in Hamilton was completely rebuilt. This included the installation of a new concrete base, Dayton mechanical ties and 101-lb. A.E.R.E.A. T-rail with thermit welded joints. Asphalt paving in this street was placed by the city. The entire property was completely rebonded, wherever it was found necessary. Electric switch lamps were installed to increase safety. For this purpose also, special highway crossing warning signs were installed at approaches to the rail line on all primary and secondary highways.

Track work already under way and planned for this summer includes the reconstruction of 4,300 ft. of paved track in the city of Dayton, 3,600 ft. of track south of Miamisburg, 3 miles of freight line from College Hill to Mount Healthy, and the reconstruction of track through Mount Healthy and in Hamilton. Six existing sidings are to be extended, and a block signal system installed from Miamisburg to Moraine.

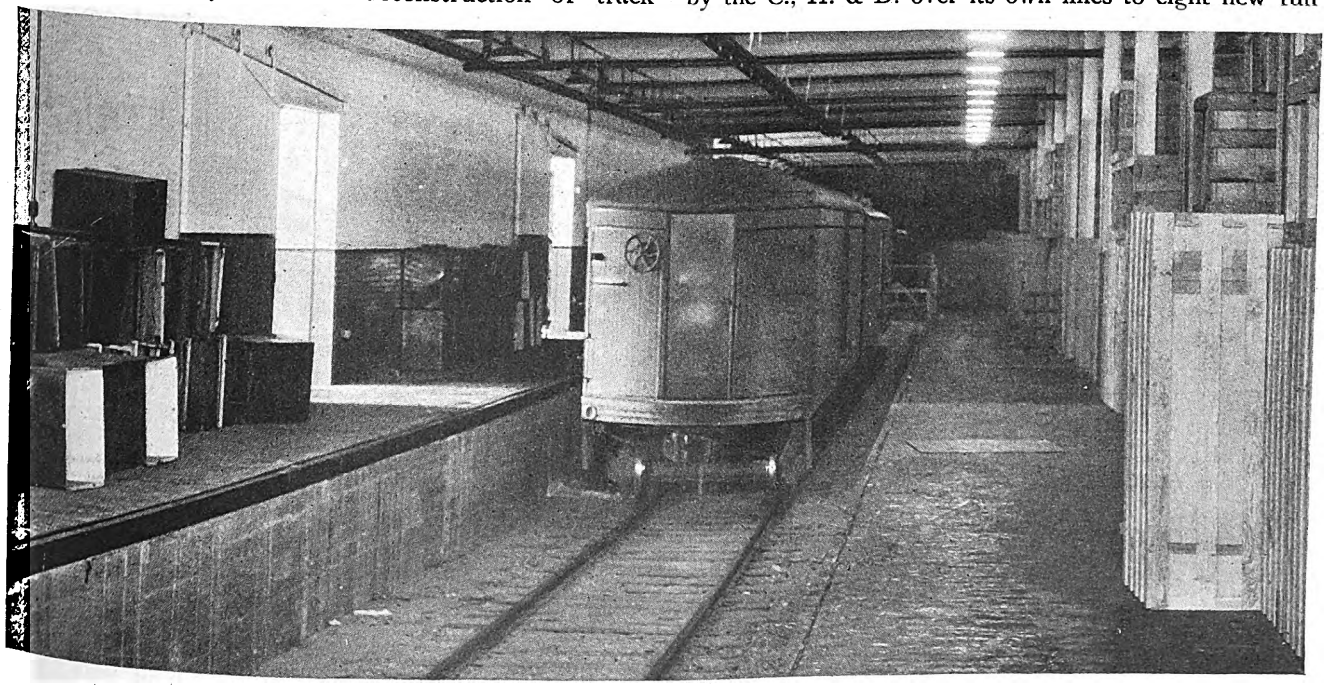


Eight modern full automatic substations provide uniformly distributed power to insure speed and reliability on the C., H. & D. This 1,000-kw. station at O'Neils is one of the two-unit stations at each end of the line

Power Supply Completely Modernized

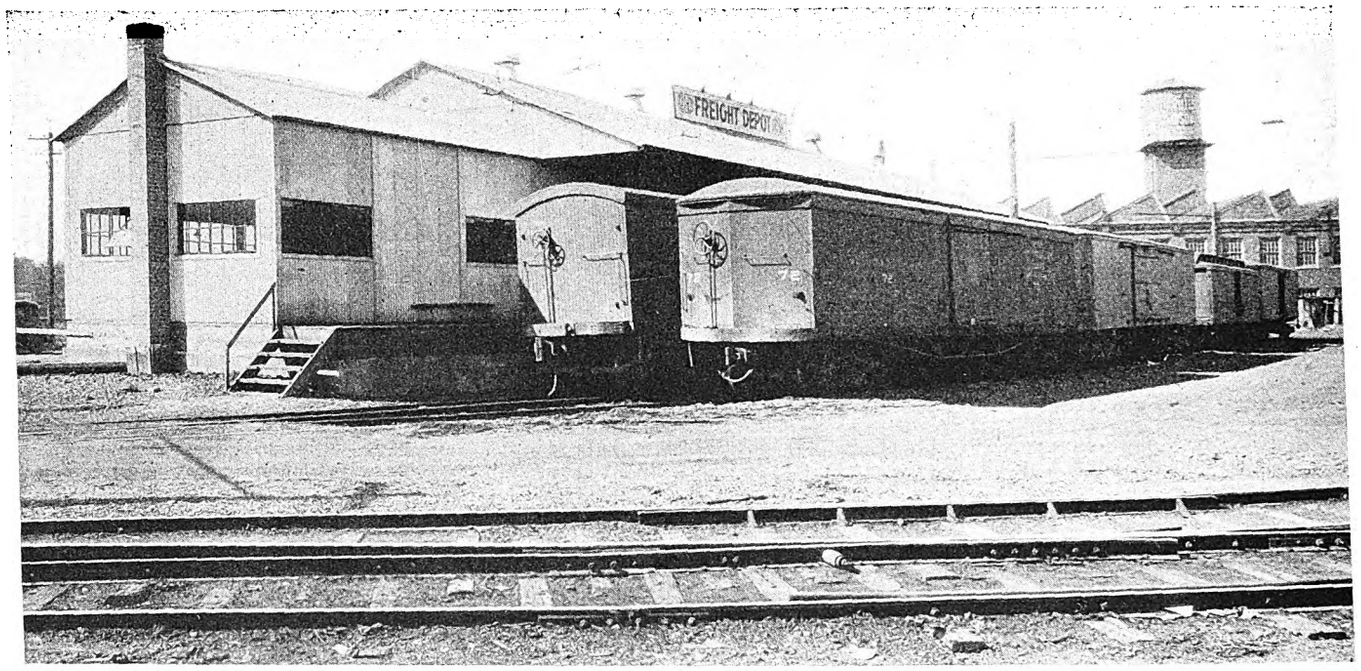
Substantial economies were made by the abandonment of the company's old 25-cycle Lindenwald generating plant. A contract for the purchase of power was made with the Union Gas & Electric system of Cincinnati, which provides power at 33,000 volts and 60 cycles from three generating plants, two in Cincinnati and one in Hamilton, all connected to that system's high-tension bus in Hamilton and fed over two circuits from the Hamilton station to the C., H. & D. transmission line. Oil switches and disconnects are arranged for sectionalization of the transmission system north and south from Hamilton in the event of line failure. An auxiliary connection is made at Dayton to the Miller's Ford plant of the Dayton Power & Light Company, for use as an auxiliary power source in the event of an emergency.

This purchased power is transmitted at 33,000 volts by the C., H. & D. over its own lines to eight new full



Freight loading facilities inside Delco-Frigidaire plant of the General Motors Company. From three to sixteen carloads of freight per day move out of this plant over the C., H. & D.

Digitized by Google

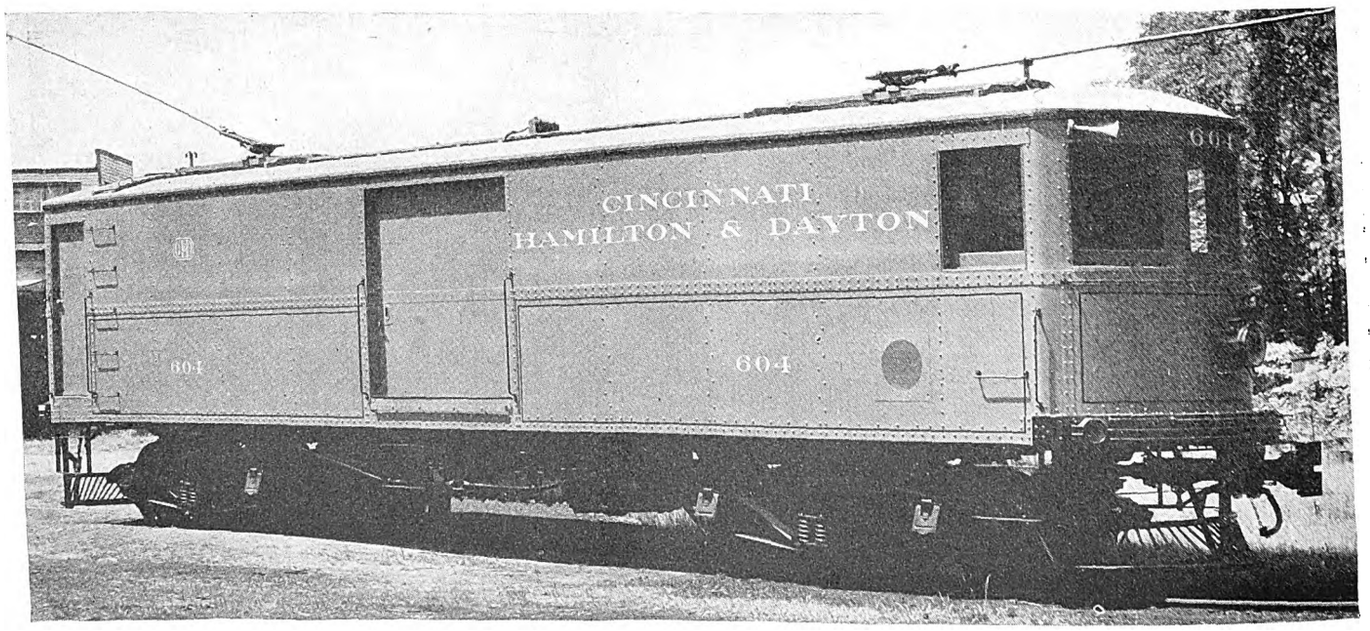


New freight terminal at Cumminsville in outskirts of Cincinnati. These improved facilities make it possible to go after freight business intensively. It has already become necessary to make additions to this terminal

automatic substations that replace six former 25-cycle manually operated stations. Five of the latter have been abandoned. One of them, the College Hill station, was reconstructed for the new automatic equipment. The other seven automatic stations are in new buildings specially constructed for the purpose. The new station locations give better and more uniform spacing and consequently better voltage regulation over the line. At some points on the property, the increase in voltage is 75 per cent over the former condition. The average increase in voltage on the system attributable to the elimination of excessive line drop amounts to 20 per cent.

Starting at Dayton, the substations in order are O'Neils, Miamisburg, Franklin, Elk Creek, Coke Otto, Lindenwald, Pleasant Run and College Hill. O'Neils and College Hill are two unit stations, the former having two 500-kw. machines and the latter two 300-kw. rotaries. All of the other stations are single unit installations. Coke Otto and Lindenwald, on either side of the city of Hamilton, are 500 kw. each. All of the other single-unit stations have 300-kw. machines. Coke Otto and Lindenwald serve the city lines in Hamilton as well as the interurban. By arranging a 500-kw. station on each side of the city, the local lines there may be kept in operation from either station in the event of failure of the other.

All of the substations are full automatic with Westinghouse equipment. Any one of the eight stations may be set, by the operation of a manual switch, to stay on the line and not shut down under light load. The two two-unit stations, O'Neils and College Hill, are located at each end of the line; the former at the north end and the latter at the south end. Being at the ends of the line and feeding in only one direction, two units are used

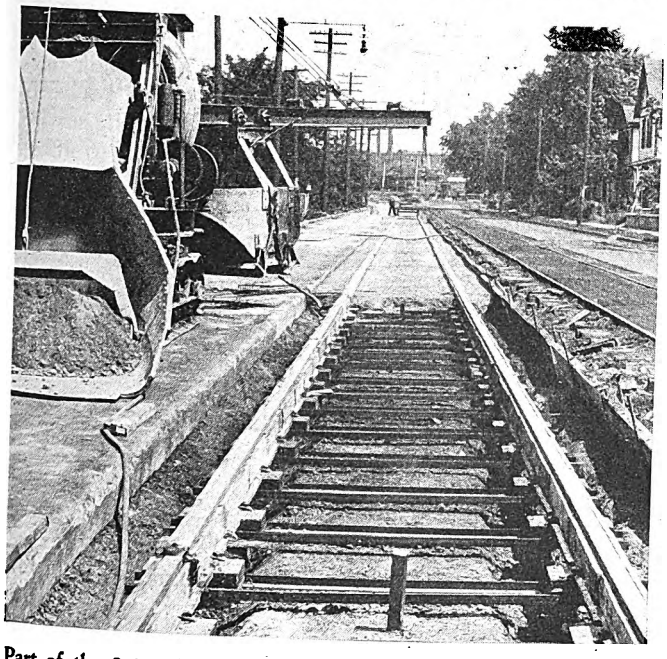


A new 50-ton motor car built by Kuhlman makes it possible to increase the length of freight trains on the heavy grades north of Cincinnati

Digitized by Google

in these stations to give additional protection in the event of failure of one machine. Furthermore, the average load conditions in these sections call for only small rotary capacity during most of the day, with additional capacity in the rush hours or in the event of unusually heavy freight movements. The use of two units permits operation at maximum efficiency under these load conditions.

In the operation of the twin stations, one machine picks up the load and the second comes on only when the capacity of the first is exceeded or when the first machine fails to pick up. Either rotary may be made the leading machine by merely throwing a small manual four-pole switch. All rotaries are plain shunt wound instead of being compound as is customary practice. The shunt winding is claimed by H. W. Bishop, who acted as consulting engineer in connection with the new power installation, to give better load distribution between stations than is obtained with compound-wound machines



Part of the 2.4 miles of new track built on Pleasant Avenue in Hamilton. Construction is concrete base, 101-lb. T-rail, thermit joints and Dayton mechanical ties. Asphalt paving was placed by the city

usually used. Another feature of the power installation is that the transformers in the substations have no automatic switches on their primary side and are left alive continuously.

Modern and Commodious Shop

A modern car shop is necessary to the proper maintenance of rolling stock and to its efficient inspection and repair. In this respect the C., H. & D. will have, when remodeling work now under way is completed, what will probably be the finest interurban shop for a property of this size in the country. Two modern concrete brick and steel buildings of high-grade industrial type of construction, together with some 9 acres of land immediately adjoining the company's right-of-way and the Delco-Frigidaire plant, were purchased from the Smith Gas Engine Company. The larger of these two buildings is 422 ft. long by 111 ft. wide. The second building is 160 ft. long and 101 ft. wide. A full complement of machinery, including wheel presses, milling machines, boring mills, lathes, drill presses, shapers, shears, radial drills, forging and welding equipment and wood-working machinery, is provided, much of which was purchased with the property. Three overhead traveling cranes run the entire length of the larger building, and there are in addition some fifteen jib cranes to serve individual machines. The floors of the shops are laid with wood block set in concrete. The main building will house the truck, paint, electrical, blacksmith, machine and general inspection and overhaul shops. The wood-working shop will be in the smaller building.

A storage yard has been laid out between the two buildings with a capacity for 75 cars. Entrance tracks to the buildings are arranged so that single cars or trains may be run directly into the shop for inspection or repairs. Loop tracks are arranged so that cars may be moved in and out of the yard or shop with a minimum of switching. There is ample natural and artificial illumination to insure efficient working conditions. The main building will house the general offices of the company that at the present time are located in the city of Dayton. It has been found that the saving in rent made will almost pay fixed charges on the entire investment in shop building, land and equipment. The old shop at O'Neils has been sold to the Moraine Development Company at a figure that paid a substantial part of the cost of the new shop. It will be abandoned and razed to make way for a new boulevard entrance into the Moraine development.

Large Suburban Expansion Planned on Northern End of the Property

When completed the Frigidaire plant at Moraine will employ upward of 12,000 men, a substantial proportion of whom will travel morning and evening by the C., H. & D. northward to Dayton and southward as far as Middletown. The interests affiliated with the Frigidaire enterprise some time ago purchased approximately 2,000 acres in the immediate vicinity of the plant. Within the last few months the active development of the property as an industrial town has been inaugurated. Sewers and water and gas mains are being laid, streets are being paved and other developmental work is proceeding rapidly. The C., H. & D. will play an important part in the development of this community, both through the provision of frequent rapid-transit service to and from Dayton and points south in the Miami Valley and through the provision of freight facilities for contractors and home builders and transportation for the residents of the community.

Modern Freight Facilities

Facilities provided for the efficient handling of freight are sufficiently in advance of those found on the average interurban property as to be worthy of some detailed discussion. The ultimate possibilities of freight business on the line are undetermined because to a considerable extent the business is contingent on interline possibilities of the other connecting interurban lines in the central Ohio and Indiana territory. Cincinnati, however, offers a gateway to the South for electric freight from the entire central territory if electric railway facilities are sufficiently developed through the district to handle it properly.

Besides the 40 new standard C.E.R.A. box cars previously mentioned, there is under construction by the Kuhlman Car Company in Cleveland a 50-ton freight motor car having the same capacity and equipment as a

Digitized by Google

Westinghouse standard 50-ton electric locomotive. In addition, there are on the property four freight box cars equipped with four 140-hp. motors each, and nine additional box trail cars.

Longer Trains on Hills

The new freight motor unit is of all-steel construction and is equipped with four Westinghouse 562-D-5 motors that are ventilated by motor-driven blowers mounted in the car. The longitudinal sill channels of the car underframe are covered with a plate to form an air duct that is connected in turn by flexible canvas ducts to the individual motors. The blower has capacity to give approximately 800 cu.ft. of air per minute to each motor. Total weight of the unit is 100,000 lb., which is divided 46,500 lb. for the body, 13,000 lb. for each of the Brill 50-E-4 arch-bar trucks without motors, 25,000 lb. electrical equipment, and 2,500 lb. for air-brake and other equipment. It is mounted on 36-in. wheels and has a gear ratio of 17:60. Double end HLF control is provided. The trucks have a wheelbase of 7 ft. 6 in., and the unit is designed to negotiate curves of 35 ft. radius.

This motor car is intended for service on the hills between Cincinnati and Hamilton, where it will make possible the handling of five-car trains of loaded box cars over maximum grades of 5 per cent in place of the present limit of two cars with the old motor equipment formerly available.

Both ends of the steel body are framed for three window sash. The side posts consist of 4-in., 13.8-lb. H-bars, extending from the bottom sill angle to the top plate. An intermediate belt in the body framing consists of a 4-in. x ½-in. plate extending full length of the car and around the ends, and securely riveted to all posts. Doors are of steel frame construction, paneled with steel. At the center of the body on each side there are sliding doors, inside hung, which slide into steel inclosed pockets. At each end of the car, on the left side of the vestibule, is a swing door for use of trainmen. On the interior there are two safety partitions, one located at each end of the car, approximately 6 ft. from the end. These partitions extend from the floor to the ceiling and are constructed of substantial steel framing sheathed on the inside. Each partition has a sliding door with hasp and staple so that the interior of the car may be completely sealed. The inside of the body is sheathed with No. 12 gage steel. On the outside it is covered with $\frac{3}{16}$-in. steel plates.

While it is as yet too early to form any final judgment as to the effect of the new interurban equipment on passenger traffic, the results secured during the first twenty days of July show a gratifying and unmistakable increase in business, according to the management. This increase is upward of 6 per cent over the revenue immediately preceding the introduction of the new equipment. Based on experience on this property and elsewhere, it is felt that the growth of traffic occurs cumulatively for several months following the introduction of new equipment, as the advertising program is taking effect.

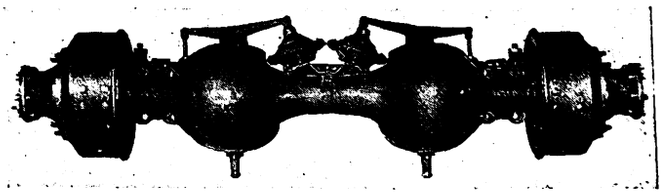
Whereas the steam railroads in the Dayton-Cincinnati territory are showing decreases in freight traffic, the C., H. & D. continues to forge ahead in building up its freight business. The same policies which were used by the same management with success on the Aurora, Elgin & Chicago are meeting with equal success on the C., H. & D. Freight revenues have increased month by month over the corresponding months of last year, as follows: January, 23.2 per cent; February, 27.8 per cent; March, 33 per cent; April, 29.5 per cent; May, 22 per cent.

New Type of Gas-Electric Bus

Public Service Transportation Company has ordered 65 units with an electrical system differing in several respects from that used on previous orders by this large operator

SIXTY-FIVE gas-electric buses of A.C.F. design utilizing Westinghouse electrical equipment are being placed in the service of the Public Service Transportation Company, Newark, N. J. At the time of this writing 30 of the units, chassis and electrical equipment, have been delivered by the American Car & Foundry Motors Company to the Newark shops of the Public Service. The bodies are being built there by the Public Service Railway, and already twelve of the buses have been completed and placed in daily service.

The design of the new bus, which is built to afford



Rear axle housing and brake drums, showing twin drive arrangement and the Westinghouse air brakes

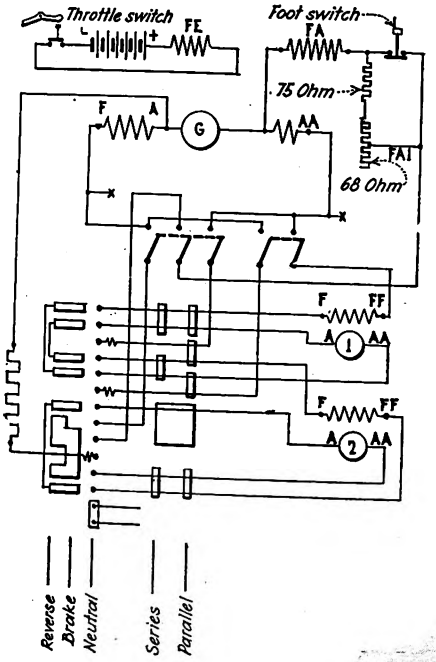
low maintenance, departs materially from any previous gas-electric drives and has several features that have been found desirable in bus operation. Among these are an interlocking device operating an auxiliary field for the generator, a drum controller with magnetic blowouts, a safety switch in the starter circuit and a new type of resistor for electric braking.

The bus equipment includes a Hall-Scott engine, a Westinghouse type 188 generator, two type Y-92-C series motors, a type XD-58 main controller, a foot-operated battery switch, a foot-operated field resistance switch, a motor cutout switch and engine test terminal, a set of generator field resistors and a set of braking resistors. It also has progressive-type springs with extra leaves, a double-worm Timken axle drive, 36x8 dual high-pressure pneumatic tires, Westinghouse air brakes on the rear and Bendix mechanical brakes on the front wheels, Dot system of chassis lubrication, Golden Glow twin-beam headlamps and the Protectoseal safety device for the fuel tanks. The general arrangement of the apparatus is shown in the accompanying illustrations.

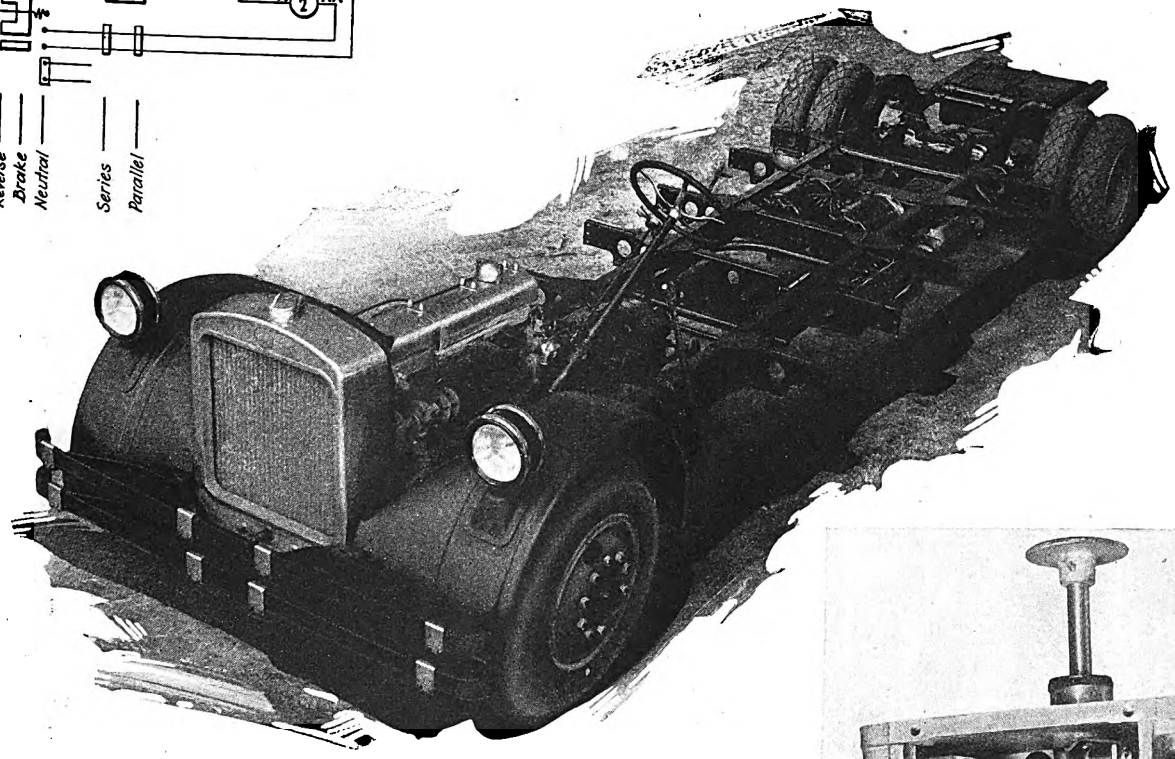
Generator Has Special Field Windings for Speed Control

The generator, rated at 240 volts and 120 amp., is located behind the engine and is connected directly to it by a hollow shaft and two flexible couplings. It has an interpole shunt winding, a small amount of series field for compounding and a battery field controlled through the field switch that is operated from the foot throttle. The battery field serves as a teaser, while the series field

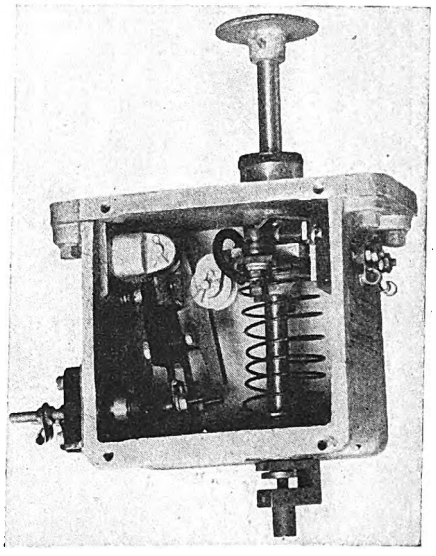
Digitized by Google



New features in the electrical hook-up include manual field control for increasing acceleration and boosting speed on grades, and interlock, which prevents starting of engine when controller is not in neutral



Gas-electric buses of A.C.F. design and equipped with Westinghouse electrical units are to be operated by the Public Service Transportation Company



Foot-operated field switch which controls the battery field circuit of the generator

minimizes the amount of battery current required. To provide for additional power output needed for rapid acceleration and on steep grades, a resistance is placed in the shunt field circuit that is controlled by a foot-operated resistance switch. Inserting resistance in the shunt field reduces the excitation and allows the engine to run at a higher speed. The generator is equipped with a unidirectional cast aluminum fan that draws air through openings in the frame and the commutator and expels it at the engine end.

Motors Used Are of the Interpole Type

The two motors, each rated at 240 volts and 78 amp. at 1,800 r.p.m., are of the interpole series type and like the generator have aluminum fans for ventilation. They are controlled by a type XD-58 drum controller, which is provided with magnetic blowouts eliminating dangerous arcing, and having three operating positions in addition to the off and braking positions. There are two forward positions—one for series operation, the other for parallel. The wiring for the engine starting motor is carried through the controller and forms a circuit only when the controller is in the off position. This is a desirable safety feature. The drive from the two motors is through a double-worm Timken axle. The twin drive arrangement is shown in the accompanying illustration.

A new type of resistor is used for electric braking and is mounted midway between the generator and the motors.

Although the bus is designed for service under various conditions of load and grade it is simple to operate. With the bus standing, the engine is started with the controller in its off position and the controller handle then moved to the desired operating position. The bus is then accelerated by depressing the foot throttle. To increase the rate of acceleration, resistance may be cut into the generator shunt field with the foot-operated switch. This is also used when the bus encounters a slight grade. On more severe grades the controller is shifted to the series position. Down-grade control is effected with three kinds of brakes—electric, Westinghouse automotive air type and Bendix mechanical type.

The buses are of the single-deck type and have a seating capacity of 30. The weight of the chassis of each bus is 11,500 lb., the electrical equipment being responsible for 2,400 lb. of this.

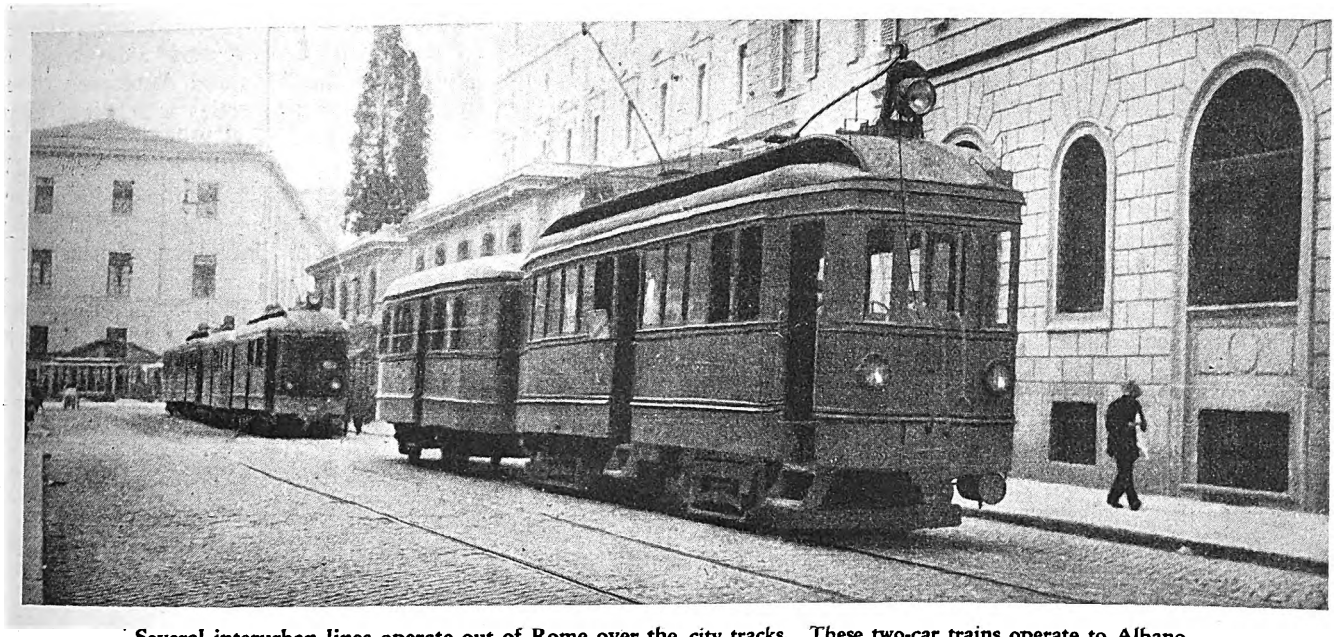
Italy Has Many Interurbans

By Henry W. Blake
Senior Editor *Electric Railway Journal*



Several interurban lines operate out of Rome over the city tracks. These two-car trains operate to Albano

Competition from private automobiles not serious, but buses appear to be taking some business. High-speed electric interurbans increasing. Lombard Electric Traction Company uses all-steel pay-within cars in local service and is erecting houses for men

ITALY has always had a large number of interurban railways built along the highways, and, like those in America, primarily for local service. Originally most of these lines were operated by steam dummies, but many of them, of course, have since been changed to electric operation. The construction of these interurban roads has always been encouraged by the government because of the need which they supply of transportation to rural communities. Statistics published by the Italian Government show that of this class of road there were on Jan. 1, 1925, when the latest figures are available, 4,453,943 km. (or 2,783,714 miles) of such track. Of this mileage about 62 per cent is operated by steam locomotives, 36 per cent by trolley and the remaining 2 per cent by a mixed service. Of the total, 73 per cent has a gage of 4 ft. 8½ in. and 14 per cent a 1 meter gage (39.4 in.). The accompanying Table I gives the distribution of trackage by provinces. The roads included in this summary and table are exclusive of the interurban lines over private right-of-way outside of the State Railway system. Of this class of road there were on Jan. 1, 1925, 4,605 km. (2,879 miles) of track in service in various parts of Italy.

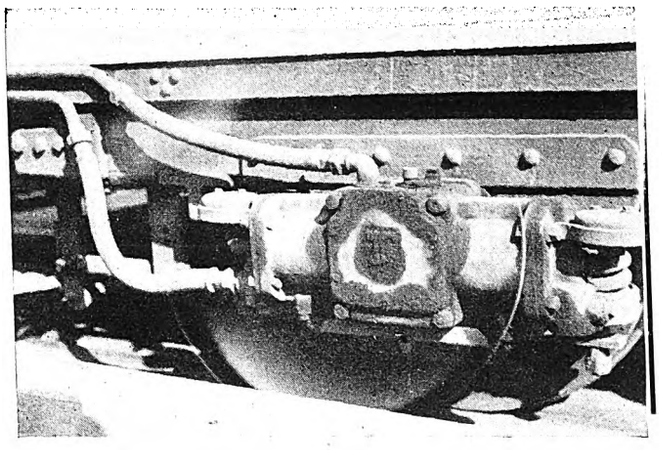
On the whole, these interurban roads, both those on highways and those on private right-of-way, have suffered less from automobile competition since the development of the gasoline motor car than the interurban roads in the United States. The primary reason for this is that the private automobile is looked upon in Italy, as in most countries in Europe, as a luxury which can be afforded only by the most wealthy classes. Whether this condition would be changed if a light, open, inexpensive car locally built was placed on the market it is difficult to say. Nevertheless, the fact remains that one can tour for miles, particularly in southern Italy, and meet very few private cars on the road, and most of these will be closed and usually be of the limousine type.

While the interurban lines have not suffered in their passenger business to any great extent from the use of private cars they must have felt the competition which has come during the last four years from the many bus lines which have been put in service in Italy. The same government publication which gives the statistics of interurban electric lines already quoted also lists the bus lines in operation. These statistics are given in Table II.

Italy, therefore, has much the same situation in regard to the interurban railway versus the interurban bus that exists in the United States. And while the parallel does not hold true in all respects, for the reasons already given, it is most interesting to note that in one respect the experience has been very much the same. This is that the electric roads which have been built to give good service at high speed have felt the competition the least, and provided the territory served is one which can support a high-class electric line they have found that the traffic will respond to that service.

Each of the large cities in Italy is therefore the center of an extensive interurban system. Thus, reaching out from Rome there are a number of interurban lines of

Digitized by Google



Air compressors are usually driven from the axle, but on narrow-gage roads often have to be put outside the wheel, as shown in this view

which the longest, known as Ferrovia Vicinali, extends southeast as far as Frosione, 70 miles away. This is electric. Another interurban line, electric for the greater part of the way, goes 58 miles to Viterbo. A steam tram line, 18 miles in length, connects Rome with Tivoli. The interurban lines from Naples extend mostly along the shore of the Mediterranean, west and southeast from the city. The longest is that to Salerno, about 35 miles away. From Pompeii to Salerno, or for a greater part of the distance, there are many steep grades and sharp curves through village streets. An interesting feature of the equipment is that, as the line is narrow gage, the axle-driven air compressors for the brakes had to be mounted on an extension, outside the journal box, of one of the axles.

Of all the cities in Italy, however, Milan ranks first as an interurban center. Itself possessing some 750,000 inhabitants, it is surrounded within a 36-mile radius with many prosperous towns and villages, as well as land of great fertility. Most of the territory within this radius is flat, providing ideal conditions for railway building. Of the several interurban railway systems reaching out from Milan, the most imoprtant is that of the Società Trazione Elettrica Lombarda, or Lombard Electric Traction Company. As this is one of the outstanding interurban lines of Italy particulars will be given.

Controlled by the Milan Edison Company

The Lombard Electric Traction Company is controlled by the Società Generale Italiana Edison di Elettricità, or General Italian Edison Company, which serves a large part of northern Italy with power, mostly developed in hydro-electric stations in the Alps and Appenines. The city and interurban railway properties which it directly controls aggregate 1,133 km. (708 miles) of route, of which 43 per cent are in operation by electricity and 23 per cent more will be electrically equipped during the present year. The remainder is still in operation by steam dummies, with no immediate plan for change.

The financial strength of this company assures to the Lombard Electric Traction Company ability to possess equipment adequate to the needs of the public which it serves.

TABLE I—MILES OF INTERURBAN RAILWAY ALONG HIGHWAYS IN ITALY, JAN. 1, 1925

Province	Length of Line, Kilometers	Province	Length of Line, Kilometers
Piedmont	969.045	Umbria	16.963
Liguria	31.349	Lazio	231.926
Lombardia	1,280.458	Campania	133.448
Venezia Tridentina	70.877	Puglie	84.764
Veneto	427.364	Sicilia	89.850
Venezia Giulia	83.039	Sardegna	10.600
Emilia	670.472		
Toscana	336.918	Total	4,453.943
Marche	16.870		

TABLE II—SUMMARY OF INTERURBAN BUS LINES IN ITALY, JAN. 1, 1925

Province	Length of Route, Kilometers	No. of Buses	Province	Length of Route, Kilometers	No. of Buses
Piedmont	2,011	345	Lazio	1,648	173
Liguria	701	124	Abruzzi	2,259	171
Lombardia	1,010	135	Campania	1,775	114
Venezia Tridentina	499	40	Puglie	592	45
Veneto	1,090	123	Basilicata	1,370	69

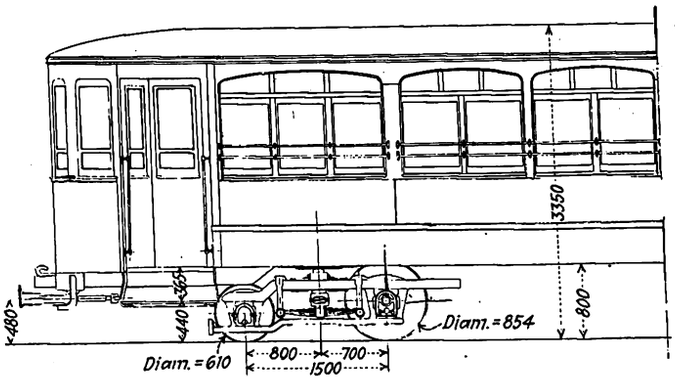
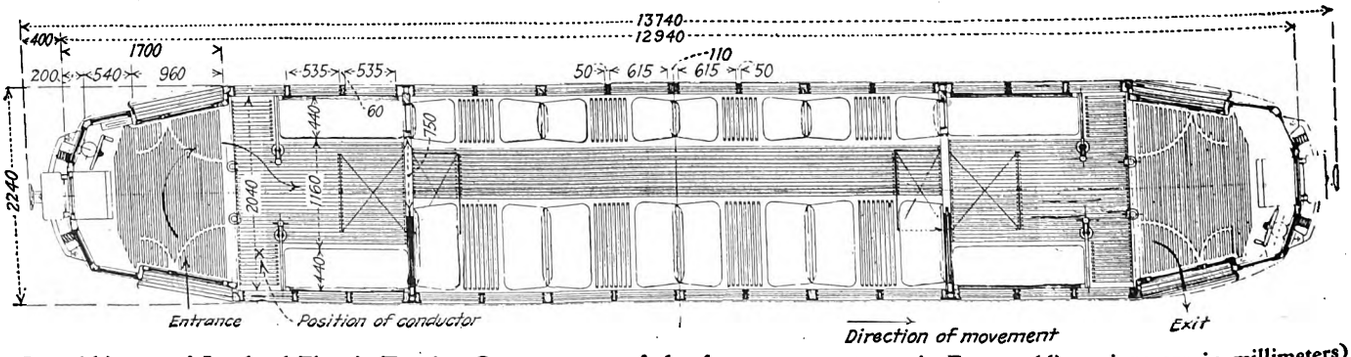
Emilia	2,241	214	Sicilia	1,516	123
Toscana	2,532	170	Sardegna	1,806	76
Marche	2,330	231			
Umbria	1,121	84	Total	27,101	2,400



The electrically operated system of the Lombard Electric Traction Company consists of five radial lines leaving various points of Milan toward Monza, Cinisello, Desio, Mombello and Abbiategrasse. On most of these lines both express and local service is given. In limited service the average speed is 50 m.p.h. The revenues from operation during 1926 were 18,934,106.39 lire, corresponding (at 22 lire to the dollar) to $860,641. With a large proportion of the line electrically equipped, it is expected that next year the receipts will be larger. Other statistics for 1926 follow: 2,383,972 motor car-



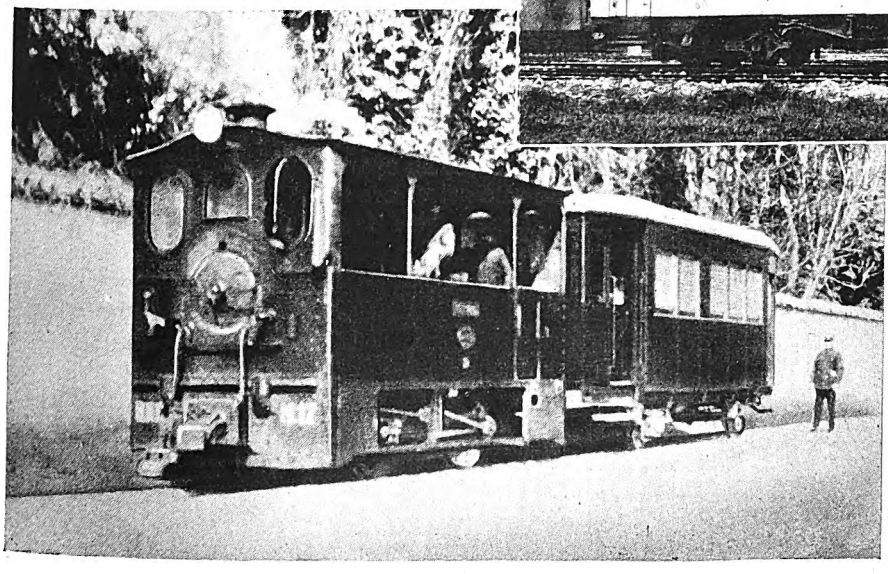
Pay-within car of Lombard Electric Traction Company, one of the few prepayment cars in Europe (dimensions are in millimeters)

Digitized by Google

kilometers (equal to 1,489,983 car-miles) were run; 2,793,022 trail car-kilometers (equal to 1,745,639 car-miles) were run; 150,838,472 passenger-kilometers (equal to 94,274,045 passenger-miles) were made.

The heaviest traffic line of the company is that between Milan and Monza. This is double track all the way, and from Sesto San Giovanni to Monza there is a third track for express service, so that for this portion of the line, or about two-thirds of the distance between Milan and Monza, the road is triple track. On this

Even the interurban cars have to be kept narrow, because of the small clearances on the streets on which they operate

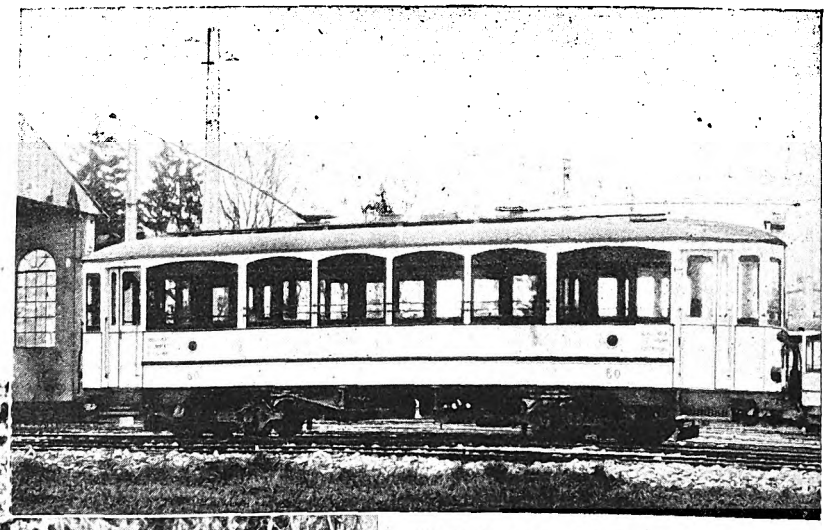


Steam tram of Lombard Electric Traction Company. These will soon be abandoned for electric operation

Milan-Monza section during 1926 the receipts were 566,662 lire per kilometer of route, corresponding to about $16,098 per mile of track. Monza, it might be added, is not only a thriving industrial city of about 40,000 inhabitants but also one of great antiquity. Its cathedral, built in the thirteenth century, contains the famous "iron crown" employed in the coronation of the Holy Roman emperors since 1311, and still used at the coronation of the Kings of Italy, who come to Monza to be crowned in its cathedral. The iron crown derives its name from the fact that it contains an iron band said to have been hammered from one of the nails used at the Crucifixion. There are other buildings and relics of antiquity in Monza, so that the railway enjoys some tourist trade as well as that naturally coming to a line connecting a city of its size with a metropolis like Milan, some 10 miles away.

A characteristic view on the Milan-Monza line is shown in the third illustration on page 186. Four features are especially noticeable in this view. One is the straightness of the road; the second, the absence of grade, characteristic of this part of Lombardy; the third, the separation of the railway right-of-way from the highway by curbing; the fourth, the inconspicuousness of the overhead construction. This is secured by attaching the span wires to the trees rather than to poles. In fact, it is common practice in Europe to use buildings (and in some cases trees) for supporting the span wires rather than poles. The method is one to be commended for economy and appearance.

The Lombard Electric Traction Company is one of



All-steel, snow-white, pay-within car of Lombard Electric Traction Company, one of the few cars in Italy patterned after American rolling stock

the few lines of considerable size in Europe to use pre-payment collection for fares. This is done, however, only in local and slow train service. Tickets are also sold on the trains, at news-stands and at the shops of tobacconists and confectioners at points on the route. There are also commutation tickets and special workmen's weekly tickets, which are sold at reduced rates.

All lines are standard gage (1,440 mm. or 4 ft. 8½ in.) and the rail weighs 28.3 kg. per meter (56.6 lb. per yard). All track on reservation is rock ballasted. The maximum grade is 0.7 per cent. The trolley voltage used is 600, but the car equipments being purchased are insulated to carry 1,200 volts, so that they can run on a 1,200-volt line if necessary.

All Cars Snow White

A feature of all electric cars in and about Milan is that they are painted white. The city cars in Milan are finished an ivory white. The Lombard cars are painted a snow white and present a very handsome appearance on the street. The stripping, including that at the bottom of the side panel, is dark red. The trucks are painted a light gray.

Digitized by Google

One of these suburban cars used is illustrated on page 189. It is mounted on maximum traction trucks with motors of 50 to 70 hp., is of all-steel construction, weighs from 17 to 20 metric tons and hauls one or two trailers. Except for its narrowness it looks very much like a car which would be employed in America in similar service. Only one class of fare is collected on the local car. Incidentally, this is one of the very few all-steel cars used in urban or interurban electric railway service in Italy.

For high-speed express service four-motor semi-steel cars with center entrance and designed to haul four trailers are used. Recently a number of cars of this type, each with four 90-hp. motors and capable of hauling six trailers, have been put in operation. Center-entrance motor cars are used for this service because of the necessity felt for providing accommodations for both first and second-class passengers on express trains. The distinctions of first and second class have been abolished generally in Italy on the city tramways, though retained in some countries in Europe. The steam railroads continue, however, to provide accommodations for first, second and third class, so provision for two classes is still made on many interurban properties. The Lombard Electric Traction Company is one of them.

Other Motive Powers

Besides electricity, the company is testing one or two gasoline or gas-electric motor cars. It is thought they may fill a need on lines where the traffic is not sufficiently dense to warrant full electrical equipment. One of the gas-electric cars is illustrated below, but it is purely in experimental service yet.

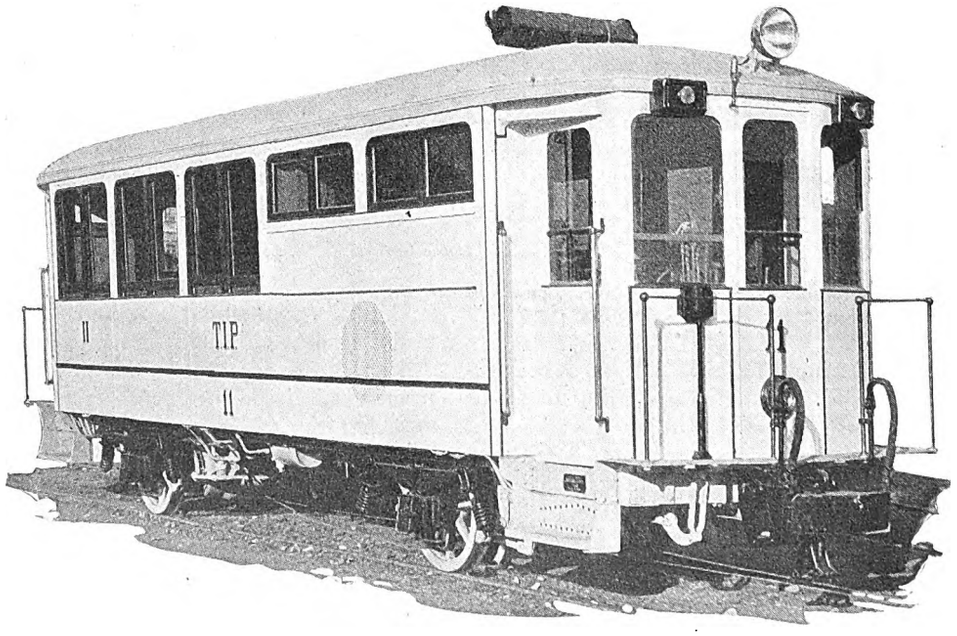
A view on page 189 shows one of the steam locomotives which the company expects to replace. At one time locomotives of this kind were in common use by the steam trains on Italian highways. A few are still left. They are well designed for their kind, but their kind has become obsolete. An interesting feature of operation of those still in use is the legal obligation that a man must clear the way for them when they pass through a village. In consequence, a flagman has to be kept for this duty. When the train approaches the town limits it slows down. Then it follows slowly a flagman who runs ahead of it, blowing a bugle to warn other vehicles that it is coming. To those unacquainted with the narrow streets and sharp corners of the usual Italian village this procedure may appear strange. But where there are no sidewalks and hardly room between building walls for two vehicles to pass and where the streets are very crooked, the rule appears more reasonable. Electric cars are exempt from this regulation, presumably because with their air and electric brakes they can be stopped much more quickly.

Housing Provided for Employees

A feature of the transportation practice of the Lombard Electric Traction Company is one which is followed to some extent on other roads in Europe, namely, that of providing living quarters near the carhouses for a portion of the transportation force. Nearness to their place of work is advantageous to the men in saving their time of transit and to the company because it can more easily reach needed employees in case of emergency. In the case of the Lombard company accommodations are provided by apartment buildings, in which the apartments can be either rented by the employee or purchased by him on the installment plan.

One of these apartments at Monza is illustrated. In case the apartment is purchased by the employee and later he retires from the service he has the option of retaining or reselling it. Each apartment house is built and owned by a separate company organized by the railway company for this purpose.

The turnover of employees on Italian roads is much less than on the average American road, so that cases of employees owning apartments leaving the service are not common. No compulsion is exercised on the men to rent or purchase an apartment in these buildings, but the rent and sale prices are made so low that they are in demand by men with families who have no compelling personal reasons for living elsewhere.



This gas-electric motor car is in experimental use on lines of the Lombard Electric Traction Company, Milan

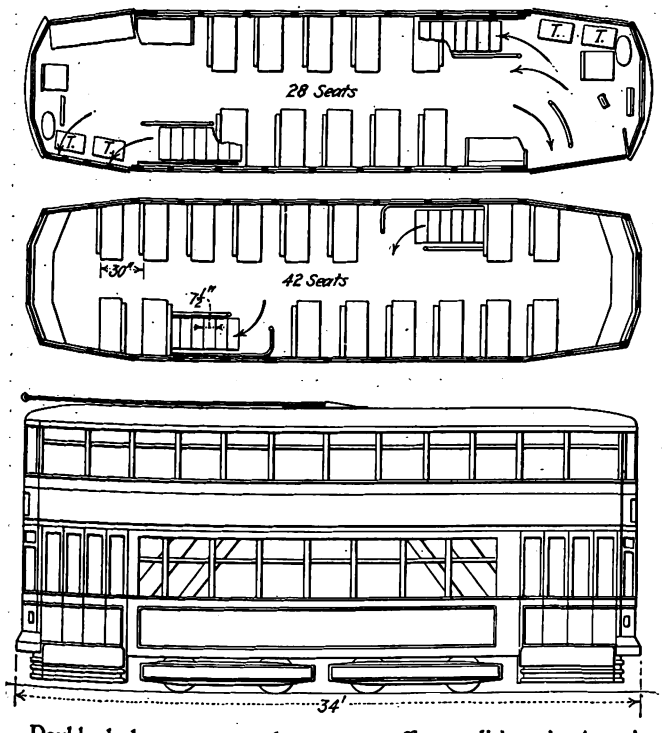
Double-Deck Car

Deserves Consideration

By Henry Watson
Tramway Engineer, Wallington, Surrey, England

Principle which has been extremely successful in Great Britain might prove advantageous in certain large American cities

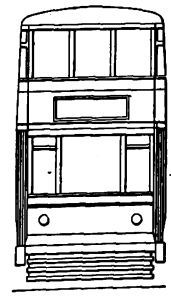
USE of double-deck buses in certain American cities may stimulate interest in the possibilities of double-deck street cars for handling traffic there. At present the use of the double-deck car is confined almost entirely to Great Britain and one or two South African cities. Neither in America nor in continental Europe has it found favor. In most large British cities single-deck cars are practically non-existent. Other countries have tried the double-decker and abandoned it. Most cities in Great Britain have operated single-deck cars and likewise have discarded them.



Double-deck car proposed to meet traffic conditions in America, designed for either one-man or two-man operation and seating 70 passengers

Advantages of the double-deck car are more noticeable in Great Britain, where narrow streets have restricted car lengths and widths, where economy is more desirable and where the public has been accustomed to a higher ratio of seats to passengers in rush hours, than in America. Perhaps these conditions have not created the double-decker, but on the contrary the car has permitted these conditions. In any case, it is interesting to observe that while American systems usually have a higher standard of comfort, on account of a larger proportion of double-truck cars, upholstered and cross seats, greater leg-room and aisle space, passengers enjoy much better conditions in rush hours in Great Britain, where the ratio of seats to passengers is higher at that time. British car designers have aimed for the highest seating capacity, whereas American operators have been willing to sacrifice seats for doorways and wider aisles. Both practices can be carried to extremes and both illustrate different viewpoints.

British cars are, roughly, 28 to 34 ft. long, 7 ft. wide, 15 to 16 ft. high, 24,000 to 35,000 lb. in weight and have 60 to 80 seats and single or double trucks, according to length. Allowing fifteen to twenty passengers standing, this gives 400 to 440 lb. per seat, or 320 to 350 lb. per passenger, against 630 to 800 lb. per seat and 340 to 420 lb. per passenger for a 45-ft. American car seating 48 and standing 40 passengers. Seat spacing is, however, more generous on the American car. Thus old British cars compare favorably with modern American cars, even under rush-hour conditions.



The opinion seems to be prevalent in America that double-deck cars are inherently slower in passenger interchange and, therefore, cannot make the average speed of single-deck cars. The writer has devoted considerable time to observing the loading of double-deck cars and buses in heavy traffic in Great Britain and can find no theoretical or practical evidence to support this theory. It may be true of cars of gigantic proportions, such as have been tried in New York, but the double-deck feature should be considered, not with a view to larger cars, but to shorter and lighter ones of equivalent capacity.

British practice favors two end platforms with a rear, double-width, combined entrance and exit, and a winding stair on the platform making a half or quarter turn to the upper deck. Superficial observers have criticised this arrangement as not providing a separate exit, but it has met requirements fairly well, for a double stream may enter or leave the car, one from each deck, and stops for boarding only or alighting only seem to predominate, at

Digitized by Google

least in British cities. Because of the double stream loading and unloading, this car can handle traffic very effectively. As stops for both boarding and alighting passengers appear to be in the minority, the writer believes that this combined entrance and exit is preferable to separate entrances and exits where they are only of single width. A few systems operate cars with a single exit doorway off the front platform, underneath or in front of the stair, cars always being double-ended. Probably increasing pressure of competition and traffic congestion will render desirable the more general use of a front exit. For American pay-enter cars a separate exit and larger platforms would be essential.

The Car Is Not Slow

At most stops the stair is negotiated while the car is moving, and it is difficult to understand why the double-decker is regarded as a slow car. The writer believes this opinion to be a fallacy supported by operators with no extensive experience with such cars, and to be proved so by the average speeds of British systems, particularly of the L.C.C. system, whose cars average 9.6 m.p.h.

At first sight this does not appear to prove much, particularly as this system does not operate into the heart of London and does not encounter heavy automobile traffic. On the other hand, it operates in very congested suburbs, considerably impeded by horse traffic and motor buses, both much more obstructive than autos, on streets seldom more than four traffic lanes wide, with little outer suburban and no rural mileage, without safety zones, with stops spaced 240 yd. apart and cars carrying nearly 100 passengers in rush hours. In spite of these conditions, it puts up an average equal to some American systems and superior to most, if not all, European city systems, whether operating single or double-deckers. The lower averages shown by other British systems as compared with American ones are due to limited semi-rural mileage, narrow streets, higher car loadings, inadequate motors, single trucks, hand brakes, etc. When these considerations are remembered, there is no evidence left to condemn the double-deck car, particularly as their averages are often better and continental averages. The Johannesburg Tramways makes 10.5 m.p.h. with double-deckers.

Mounted on two trucks, the double-decker can provide quite satisfactory riding, and the writer has never found public criticism of the riding of this type of car. Unfortunately, many British systems still operate numerous cars on single trucks of obsolete design, giving uncomfortable riding at high speeds. Much traffic has been lost to competitive buses for this reason. Some systems, intent on standardization, have even operated these cars on interurban routes, for which the double-deck car is unsuited. The absurdity of this practice has been recognized in the construction of a few single-deckers for interurban routes.

Experience has shown that the double-deck car is quite safe, overturnings on curves or through wind pressure being extremely rare. Similarly, the stair has not been found to introduce any appreciable element of danger.

The top-covered car is favored mostly by British operators, the open-top deck being found largely on smaller systems enjoying mild weather. Total inclosure of the upper deck is more popular, though cars with the ends of the top deck left open are still favored in some cities. In any case, in British practice, the upper deck provides facilities for enjoying fresh air, a wider view and smoking.

The special construction adopted by American bus builders to obtain a low top with full headroom has not been adopted in Great Britain, as it has been usual to lower the roadway under such bridges as would otherwise prevent the operation of the normal top-covered car. Such a procedure would, doubtless, be preferable where a considerable traffic were to be carried by double-deck cars. Headroom of a little over 6 ft. should not prevent satisfactory ventilation under American climatic conditions and rather adds to the coziness of the car, as is apparent in bus interiors.

The car design illustrated herewith is proposed for handling heavy city traffic and provides 70 seats in an over-all length of 34 ft., while at the same time having fairly generous dimensions in respect to seat spacing, doorways, platforms, stairs, etc. It may be operated by one man or two men, much in the same way as existing end-platform single-deck cars, at least with slight alterations. In the case of two-man operation, it might be practicable to place the conductor between a double stream of boarding passengers, who would circulate through the car in two streams, one on each deck. Such a method of operation would, perhaps, hasten passenger interchange very considerably.

The short wheelbase shown is standard British practice and does not cause appreciable pitching or nosing in service. Some cars occasionally lurch fore and aft, but this seldom assumes importance and is not inherent.

In estimating the weight of this car, it is interesting to note that some cars recently constructed by the London Tramways on the steel-reinforced wood principle with dimensions 36 ft. x 7 ft. x 15 ft. weigh 27,000 lb. approximately, with two 50-hp. motors and having some 70 seats. The car proposed might therefore weigh 28,000 lb., or 400 lb. per seat, against 600 to 800 lb. per seat in modern American cars.

Taking a 48-seat, 43-ft., 32,000-lb. single-deck car as typical, and assuming the standing load in rush hours to be 100 per cent of the seating capacity; i.e., 48, the proposed double-decker could easily carry 36 standing passengers on the same basis, being 9 ft. shorter. The 32,000-lb. car would then carry 96 with 50 per cent standing and the 28,000-lb. double-deck car would carry 106 with 34 per cent standing. The advantages of the double-deck construction are, therefore, so marked as to be beyond dispute in so far as weight and capacity are concerned.

The double-deck principle, having such great advantages, in comfortable rush-hour traveling and economy of operation and street space, proved by many years experience in Great Britain to have no inherent limitations in practice in respect to speed, comfort and safety, adopted with considerable advantage by bus builders in several countries, may warrant serious study by American car operators.

Kansas City Railway Subscribes $10,000

A subscription of $10,000 from the Kansas City Public Service Company, Kansas City, Mo., put the recent campaign of the Kansas City Chamber of Commerce for a fund of $450,000 a year for five years for industrial expansion "over the top."

Sixteen Ways to Use Buses

By Carl W. Stocks
Editor *Bus Transportation*

The author points out that the bus not only can be of value to the electric railway in many ways, but shows sixteen methods in which buses now are amplifying the rail service, making the investment more stable and more profitable

WHEN the Canadian Electric Railway Association met in Winnipeg last June Mr. Stocks was asked to address the members on the possibilities of buses as an aid to electric railway service in Canada. The present article is revised and condensed somewhat from the original address. It contains much of interest to the American street railway operator.

YOU have all heard that old saying, "A place for everything and everything in its place." It is usually employed to denote a house in order. Applied to the transportation household this means, to the motor carrier, the right type of bus in the right place at the right time; to the electric railway and steam railroad managements, rail transportation in territories when and where traffic demands and buses to serve where rail service is not economically justified.

To the public it means appropriate and efficient transportation at a cost consistent with the class of service furnished, and with each agency serving in the place where it can serve best. And the signs of the times indicate that a rearrangement is quickly going on in the transportation household to approximate this order.

The motor carrier has learned that service economies and improvements resulting from the use of the most efficient size and type of equipment cannot be ignored. Careful calculations of traffic by routes and trips are now dictating schedules and size and type of buses. Constant watch is being kept to see that the maximum number of people are being served by having buses at the right place at the right time. The electric railway and steam railroad managements are doing exactly the same thing, except that they have two sets of tools with which to work; i.e., vehicles that run on rails and those that run on the highway.

As the economics of transportation become better understood and more widely adopted, it is reasonable to believe that many of the arguments now existing between advocates of rail transportation on the one hand and the motor bus on the other, and which have heretofore prevented this orderly arrangement, will disappear. The sheer weight of the argument appears to hinge on the opportunity for profit and the outlook for a continuance of that condition during the life of the investment. In the last analysis this is largely based on the ability of the carrier to earn a return sufficient to attract outside capital for investment.

Today we find four major means of transport, each often largely competitive with the others if territorial coverage alone is considered. But I do not believe that is the true measure of competition, for the reason that each agency can be made to serve where the other will fail from mere lack of ability to earn enough to meet fixed charges.

When I speak of four major means of transportation, I refer to:

1. Steam railroads.
2. Privately owned automobiles.
3. Electric railways.
4. Motor buses.

The order named, I believe, represents fairly well the magnitude of the investment in each. If we stop for a moment and think of their growth and development as public carriers, we find a marked similarity between the steam railroads, the electric railways and the motor buses. Their early history indicates how American genius has always contrived to seek and to improvise a quicker and easier way to accomplish the same results. In other words, the history of the steam railroads was largely repeated in the interurban trolley field, and the motor bus is following along much the same path. Existing steam railroad systems are the outgrowth of attempts to better serve the people—consolidations have been carried out, first with an attempt to operate through schedules and then later to weld one system with another to form a more comprehensive unit.

In the trolley car field, what large city system can be pointed to that is not of the same making? There's Winnipeg, Toronto, Montreal, New York, Boston, Brooklyn, Cleveland and Chicago, to mention just a few.

Now the motor bus industry is repeating that very development. Starting with individually owned vehicles, then adding one or two at a time as payments were possible, later incorporating or forming partnerships as the investment increased, these single lines have grown through mergers or sale into multi-line systems. I think of one system in northern New York that today is the outgrowth of more than 25 single-line routes covering nearly 800 miles of highway and doing close to a million dollars worth of business annually. Many other examples could be cited. During 1926 we recorded in the columns of *Bus Transportation* 116 sales of operating companies. The best part of this trend is that, in most instances, better transportation talent is replacing haphazard management, and there is a marked improvement in operation, in maintenance, and personnel.

Transportation Often Over-Exploited

In some quarters it is said that the bus has been over-exploited. But other transportation mediums also have

Digitized by Google

been. So that is nothing new. In this connection I want to say that I believe it is unfair to declare today, as many are doing, that trolley lines constructed 20 or 25 years ago should never have been built. In isolated instances this is so, but I am an old street railway man myself and have had some opportunity to observe the early development of the industry. I say that generally trolley lines were built in good faith to serve the public, but that economic development in later years has so changed the aspect of the transportation field that some of the trolley lines built years ago into then growing territories or hoped-for developments have simply lost out. Dwindling traffic due to changed conditions, brought about by the private automobile traffic and the subsequent growth in improved highways, has forced operating economies to such an extent that the class of service given is not the type demanded by the public today.

This brings up the interesting question, what does the public demand in the way of transportation? Transportation today is as much a competitive industry as is any other business. Time is the only product for sale. In the past it was a ride, and only until recently, with the advance of the privately owned automobile, has this idea begun to be recognized by the transportation companies. Why is it that people are willing to pay excess fares to ride on the fast trains? First, it is merely the question of being able to have more time for gainful occupation and, second, the railroads, with an idea of competitive salesmanship, attempt to hide this motive through advertisements of a higher quality of personal service, comfort, and conveniences.

And even then, where the service does not meet the convenience of the riding public we find them using their own automobiles, not over short distances of 25 or 30 miles, but over distances ranging upward of a thousand miles. In local transportation the same philosophy of time applies, plus the convenience of instant service. No public carrier can, of course, meet such a demand absolutely, but the bus, with its lower investment and greater flexibility, when operated at a fare consistent with the cost of the service, can approximate it.

How is the bus being used to meet this demand? What is the transportation world doing with this new agency?

As a transportation agency, the duty of the electric railway should be to lead in the use of the bus. This it has not done. However, a change is taking place. Today the electric railways of Canada are taking a leading place in the operation of buses. According to the best statistics obtainable, 257 buses were being operated in the Dominion by electric railway companies. This is well over 12 per cent of the 2,000 common carrier and private carriers, including school and hotel buses, which are in operation in the Dominion.

These 257 buses are operated by fourteen electric railway companies. Their routes cover a total of 400 miles. Such figures are impressive of the part played by the bus in your scheme of passenger transportation.

During 1926 three of the companies first used buses; 1925 saw institution of bus service by the same number of electric railways; likewise, three instances of bus were started in 1924; one operation started in 1923, another in 1921, while to our host, the Winnipeg Electric Railway, goes the honor of seeing the value of buses as long ago as 1918 and installing its first motor vehicles in that year.

Of course, Canada as a whole is confronted by a problem which is far more severe than in the United States. I refer to snow and low temperatures, not to say mud. In discussing this, let me say that this is not an unsolvable problem. It is my belief that snow presents less of a problem to the operators of buses than to the operators of trolleys, because the public has a large interest in the clearing of streets and roads since the advent of the private automobile. By enlisting public interest, a great part of the job will be done at public expense. Only improved roads can solve the mud problem of Canada.

However, public interest is not always easy to enlist and, whether for trolley or buses, snow still remains an obstacle to operation which is present in much smaller volume in the United States.

Yet, according to *Bus Transportation's* latest figures on bus operation in the United States, the trolley companies there operate something less than 10 per cent of all buses. One company alone has more than a thousand. You can feel that Canada is well abreast of the progress toward a system of transportation in which each instrument, whether it be the steam train, electric car, or gasoline-propelled motor vehicle, will be used in its proper place so that the system will function at its highest efficiency in every part.

Many Ways to Use Buses

Now, where are we going in the future? How are the electric railway companies going to operate buses? Out of curiosity I have been making an analysis of the ways buses are used by electric railways in city service and in intercity service, and by some railroads. I have not classified these according to the major uses, and the order is just as I happened to put them down.

Bus Use in City Service

1. *Extension feeders to unserved railway territory.* These lines usually are not profitable, because the traffic is too thin for any public transportation service to make money, especially when the rates of fare are part of the fare system of the local trolley line. Many railways are using buses in this manner.

2. *Separate routes from the center of a city or community.* When operated independently of the railway system at commensurate fare with service to meet traffic demands, this usually is a profitable venture. Examples of this will be found in Tampa and Miami, Fla., and Richmond, Va.

3. *Crosstown or belt-line service connecting with the trolley or rapid transit lines.* With short hauls a 5-cent fare can be charged, or a 2-cent or 3-cent transfer sold to give a 10-cent combination fare. Traffic is generally high in rush hours, demanding a considerable amount of extra service, so it is not likely to be profitable.

4. *Buses for local service with trolleys for express.* In this instance the trolleys carry through passengers, operating express between an in-town terminal and the end of the bus line, carrying the local passengers beyond. Providence is an example of this form of service.

5. *Buses for express service with trolleys for local.* In this instance the conditions are reversed. The trolleys give the local service while the buses operate express to outer limits or suburban points, so as to cut under the running time of the trolley cars. An example of this is found in Newark, N. J.

6. *Rush-hour factory service.* Rush-hour service may be given by buses to factories or other centers of activity, to provide short cuts or cross-city hauling so as not to have the lines go through the heart of the city. Examples of this are found in Akron and in Boston.

7. *Supplanting trolley lines for lower cost.* Where the paving cost of trolley lines or track reconstruction is too high to warrant the expenditure with the volume of traffic to be handled, or where vehicular interference so slows up the cars that buses can be better used to handle the traffic, they may be substituted. In some instances buses can keep up with the speed of other traffic better. Examples may be cited in Boston and Troy and Albany, N. Y.

8. *De luxe service.* The next instance of bus use is to establish an entirely different class of transportation service, intermediate between the street car and the taxicab or private automobile. A seat is given for each passenger at a fare above that charged on the trolleys, generally close to 5 cents a mile. Examples can

Digitized by Google

be cited in Washington, D. C.; Kansas City, Boston and Toronto.

9. *Community sightseeing trips.* Sightseeing trips have become established in many cities, and little need be said about this class of operation.

10. *Special school service.* Special school service may be provided on regular routes to meet student traffic. Boston and Toronto may be cited.

11. *Chartered or special bus trips.* These correspond closely to chartered car service, except that there is greater flexibilty.

12. *Expansion into new fields.* Buses may be used to carry the service of the company into territory never before reached, or into classes of service never before attempted. The Niagara Falls operation of the T.T.C. may be cited.

13. *Contract service.* Contract service may be given for real estate firms or industrial firms for their employees and others. Such service may be given on a guarantee basis. For instance, in Richmond, Va., the railway has a contract to operate a line for the benefit of employees of a steam railroad and I think in Baltimore a contract was made with a real estate company.

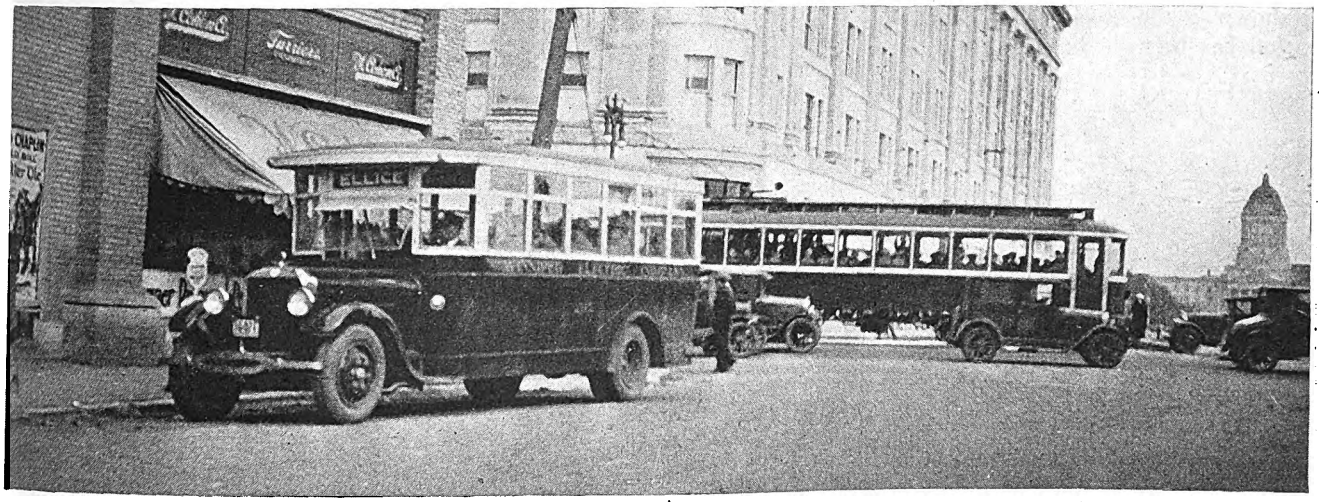
14. *Owl service.* Buses may be used during the night hours so that the entire railway system, or a portion of it, may be shut down. An example of this is the operation of the Washington Railway & Electric Company.

15. *Track reconstruction.* During track construction or reconstruction buses may be used to advantage to give temporary service. Examples of where this has been done are Wausau, Wis., and Brooklyn, N. Y.

operating companies must be organized to function on that basis. Railways, buses, taxicabs—each one of these should be organized under a separate department. Each should have a superintendent who understands he must show a profit in this competitive business.

When two services connect it is reasonable that the joint fares established can meet the cost of service. With the bus the pioneer, and the investment of much smaller magnitude, more requests for extensions are likely to be received. If the railways start all the routes requested the chances of profit are much reduced; it may be said to almost nothing. Hence each new route should be made to carry itself, and operating companies must learn not to fritter away the revenue from good trips by operating at times of the day when no one wants to ride. Three or four profitable trips at a reasonable rate of fare are worth more to the community and the carrier than a lot of non-profitable trips that run down the equipment and provide no money to fix it up.

Think also of the possibilities of interline agreements with other motor carriers in which you might hold an



Buses are used in several ways to amplify the rail service of the Winnipeg Electric Company

16. *Special uses.* In special instances buses may be used for particular purposes in connection with laboratory work. One instance that comes to mind is in connection with a series of tests being made by the Bureau of Standards in Washington. Electric disturbances affected the measurements while some experiments were being made late at night or early in the morning, so the railway stopped its cars and used buses instead until the experiments were completed.

Interurban electric railways can use buses in ways quite similar to those cited. I will not go into them in detail, but they include expansion of the system, duplication of the trolley service so as to give a faster schedule over a different route, to parallel the trolley line to give a different class of service at a higher rate of fare or the reverse, to supplant an interurban line where traffic has dwindled below that needed to meet fixed charges in order to keep franchise rights, for all-expense-paid tours, for long-haul chartered service, and for the carriage of mail and express.

Steam railroads likewise can find many uses for the motor bus. I will not attempt to give them here, although they differ somewhat from the uses I have cited already. Their object in general is to speed up the rail service, using the buses to take care of the overflow of local service.

Because transportation today is a competitive business,

interest but not control. Recognize also that there are some classes of bus routes you never can hope to operate, and extend to the owner or operator your transportation assistance in working out the problems involved, such as terminal facilities, purchase of fuel and oil, tires, painting and overhauling.

The development of bus operation is in your hands, and if you are wide awake and appreciative of the opportunity then you can control in your territory. Otherwise watch out, for you have left the door open for another company to enter.

Railway Co-operates with Michigan Highway Department

FOURTEEN cars of resurfacing gravel were unloaded and placed on the roads in Saginaw County on May 20 by the maintenance crew of the Michigan Highway Department. This was accomplished with a truck crane having a ¼-yd. bucket. The material was hauled by five trucks working ten hours and an additional truck working five hours. This record performance was achieved through the service given by the Michigan Electric Railway in looking after and placing its cars promptly.

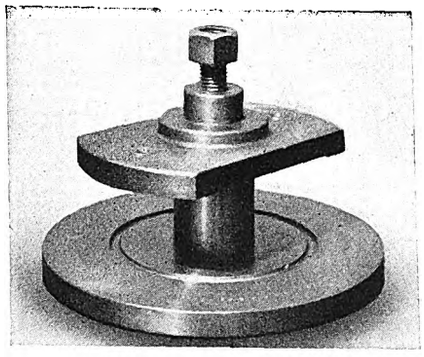
Maintenance Methods and Devices

Drilling Twelve Disks at One Operation

CENTER plates used on the rapid transit cars of the Brooklyn-Manhattan Transit Corporation have a brass wearing plate at the top and bottom. These are held in position by pins which fit into holes in the plates. In order that these may be interchangeable, it is necessary that the holes in the plates be located accurately.

To provide for drilling a number of these plates at one operation, the jig as shown in the accompanying illustration has been devised. This consists of a circular baseplate and an upright circular stud. Twelve plates are placed in this at once and are then clamped securely by the top portion, which is held down by a nut. The top plate has bushings for guiding the drill so as to locate the holes accurately.



Fixture used for drilling a number of plates at one operation

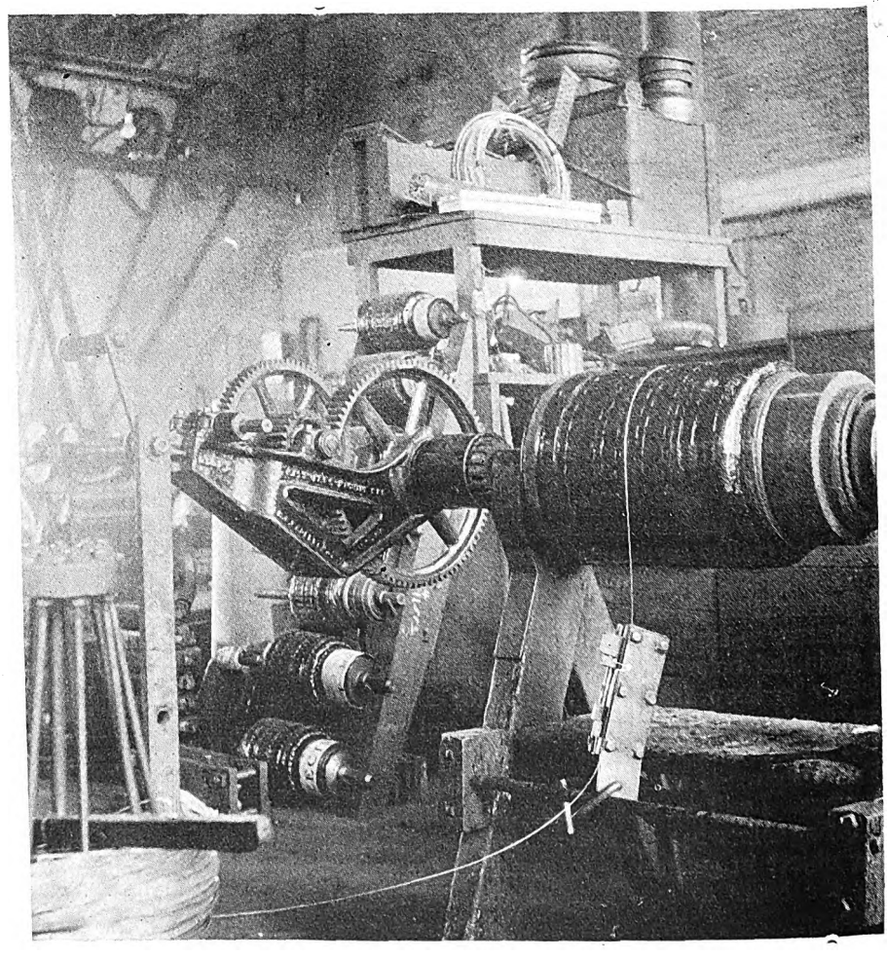
Revolving Gear Train for Banding

BANDING armatures in the shop of the Capital Traction Company, Washington, D. C., necessitated the transportation of the armatures from the armature room to the machine shop and the utilization of a lathe until Master Merchanic W. H. McCarty devised a means for revolving the armatures on the repair stands in the armature winding department. Having on hand a discarded train of Underwood portable boring bar gears, it was found that by a slight modification they could be made suitable to rotate an armature and thus permit of banding in the armature room.

A piece of ⅜-in. boiler plate about 6 in. long was shaped into a cylinder and installed on the master gear shaft. The inside diameter of this cylinder was made to permit of easy installation over the armature pinion. In the center of the cylinder, diametrically opposite, were inserted two ½-in. set screws.

When the gear train is placed in position one end is supported by the armature pinion and the other end by a ¾-in. x 2½-in. oak strip fastened to the gear train casting and projecting to the floor. Screwing the cylinder set screws in between the pinion teeth locks the gear train to the pinion and permits of uninterrupted power transmission. An 18-in. crank attached to this train of gears enables the operator to revolve an armature at any speed without very much physical effort.

This scheme has centralized the armature banding process and increased the armature room production by eliminating shop transportation with its resultant delays. Machine shop production has been improved, since the lathes have been released from banding and other work requiring lathes can proceed without interruption.

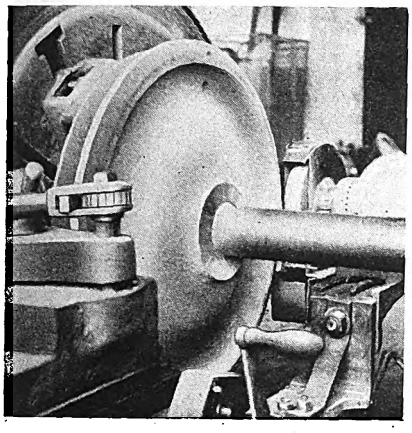


Gear train in place ready to revolve armature for banding in Capital Traction shop

Grinder Installed on Wheel Lathe

WHEELS from the cars of the Dallas Railway & Terminal Company, Dallas, Tex., in the shop for retreading are first built up by electric welding and then finished in a wheel lathe. It is not always necessary to take a cut to bring the wheel contour to standard. Many times it is possible to put the wheel in service without any machining, where the welding has been done on the flange

Digitized by Google



Grinder Installed on Wheel Lathe

Small 5-hp. motor and carborundum wheel mounted on rear carriage of wheel lathe to remove small imperfections in tread and flange contour. The carriage is moved longitudinally by the same feed screw that moves the main front tool carriage.

only. When only a slight amount of refinishing is necessary it is done with auxiliary electrically driven grinders on the lathe. As shown in the accompanying illustration, the motor grinding device is mounted on an auxiliary carriage which extends to the rear of the lathe. The motor is a 220-volt a.c., 5-hp. type and carries a 10-in. x 1½-in. carborundum wheel. It revolves at a speed of approximately 1,500 r.p.m.

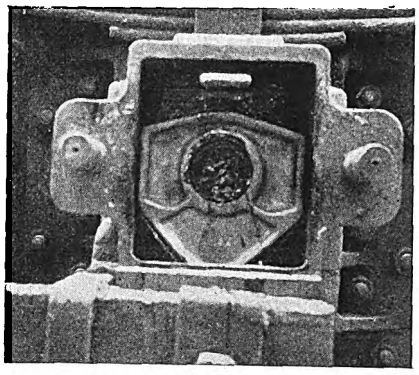
The longitudinal feed of both motors is similar to those of the main carriages and cutting tools. The cross-feed is by hand. In operation it is necessary only to set up the grinding wheel to the work and cut in the feed. Motors and accompanying grinding wheels move in opposite directions through the action of the transverse feed screw. This method for minor finishing of the wheel face and flange contours is more economical and produces better results than to take fine cuts with the tool, thereby removing the hardened surface so essential to maintaining long wheel life.

Journal Barrier Saves Oil and Packing

JOURNAL boxes on the cars of the London Underground Electric Railway, London, England, are packed with wool waste, as is the standard practice in this country. The inside of the housing is nearly square, and formerly the entire lower part was filled with wool packing, which was then soaked with oil. For some little time a different method has been used by which better lubrication is obtained with less use of oil and packing. A $\frac{1}{16}$-in. V-shaped steel perforated barrier goes all the way across the box in the position shown in the illustration. This barrier is in two parts. The packing is placed on top of it and the triangular portions in each corner act as reservoirs for free oil.

It has been found that this practice not only cuts down the amount of wool packing required by about half but the packing is held more closely against the axle and is not apt to get stiff and soggy. With this improved method, it is now possible to lubricate the car journals only once in six months instead of every month, as formerly. The London Underground Railway does not claim to be the originator of this method of oiling car journals, which has been employed with good results on the electrical division of the Victorian State Railways in Australia.

Incidentally, the London Underground is now recovering and straining used oil from its armature cups.



A perforated steel barrier cuts off the lower parts of the axle box, saving packing and giving better lubrication

After being drained from the cups, the oil is put through a large tank with electrical resistances underneath to keep the oil warm. It is then put through a gauze strainer, then through 6 in. of wool strainer. The recovered oil is used on suspension bearings and axles. About 2,600 gal. of oil a year is recovered in this way.

100 Ideas Presented

in Prize Contest

UP TO the time that this issue of ELECTRIC RAILWAY JOURNAL goes to press nearly 100 short articles have been received in the Maintenance Competition. Additional items will no doubt come in for the three capital prizes of $200, $100 and $50, as any contributions that bear a postmark dated before Aug. 1 will be eligible.

While this closes the contest for the three capital prizes, material sent in will continue to be eligible for the prizes of $25 to be awarded each month. This contest will run a year and manuscripts received up to April 30, 1928, will be accepted for the monthly prizes.

A.E.R.E.A. EXECUTIVE COMMITTEE RATIFIES APPOINTMENT OF JUDGES

The judges in the Maintenance Competition, consisting of A. T. Clark, chairman; Howard George, Charles Gordon, Guy C. Hecker and F. McVittie, who were informally appointed by President Daniel Durie of the American Electric Railway Engineering Association last May, were confirmed by the executive committee of the Engineering Association at a meeting held in New York on July 18, 1927. It was also voted that the committee of judges will be known as the ELECTRIC RAILWAY JOURNAL'S Maintenance Contest Committee. The judges have thus been made a committee of the association. The JOURNAL is very grateful to these men, who are giving their time in such a painstaking manner to study each article, analyze its good features and decide on the ones which possess most merit.

Here is a brief summary of the contest conditions:

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated prior to Aug. 1, 1927. For the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints, or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given above will be found in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

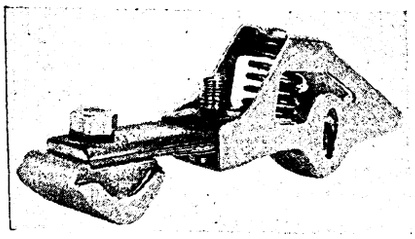
New Equipment Available

Hinged Type Controller Finger

PRACTICAL elimination of the trouble due to broken and bent fingers is claimed for a new hinged-type finger for railway controllers introduced by the General Electric Company, Schenectady, N. Y. Contact pressure is maintained by means of a rigid hinged arm and a spiral spring of steel. The arm carrying the tip is of steel and will not bend



A rigid hinged arm and a spiral spring maintain contact

or break. The hinge seats and rocks on a steel tongue which is narrow enough to allow full-width contact through the alignment of tip and segment. This feature reduces heating and burning of both segments and tips and prolongs their life. The finger is equiped with a removable tip, so that worn tips can be replaced.

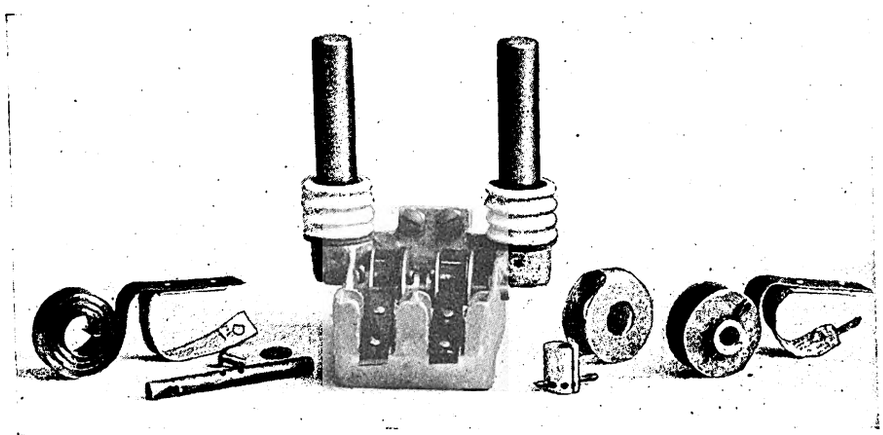
The new finger will shortly be furnished in all standard railway controllers and is available for finger replacements on many old types of controllers.

Improved Brush-holder for Replacing Old Types

SPRING pressure mechanism for brush-holders has been developed by the Westinghouse Electric & Manufacturing Company for use with railway motors. This pressure finger is simple in construction, with fewer wearing parts, and has a general application to a large number of the various old and new types of motor brush-holders.

The general construction of the twin washer type pressure finger can readily be seen from the illustration, which shows this mechanism in detail and assembled. There are no moving parts to wear the spindle or tension barrel, thus the danger of faulty spring action due to friction at the spindle is eliminated.

This mechanism has wide application, being applicable to both pin type and insulated bolt type brush-holders.



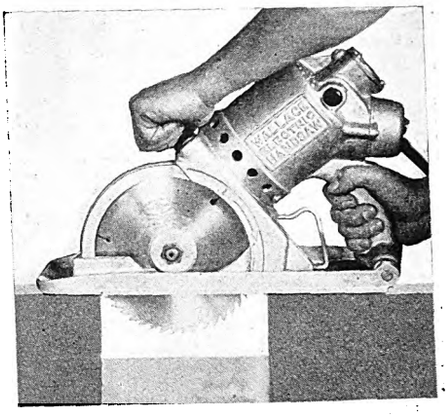
Spring pressure mechanism for brush-holder

Portable Electric Handsaw

FOR use in place of the ordinary handsaw for wood-working operations, a portable electric tool has been developed by J. D. Wallace & Company, Chicago, Ill. The saw is driven by an electric motor which can be used on either alternating or direct current circuits. The construction is such that a larger saw blade than intended cannot be put in the unit and so the motor cannot be overloaded.

The guard is locked in a position which covers the blade at all points. When the operator wishes to cut, he simply releases the safety guard by means of a trigger conveniently placed near the grip. When the cut is finished and the saw is lifted from the work the safety guard or shoe drops automatically and locks in position, covering the blade, and will not open again until released by the trigger.

With the depth gage which is provided, the saw can be set to cut accurately to any predetermined depth. A standard 8-in. round-hole blade is used. Ball bearings are incorporated in the construction and gears run in grease.

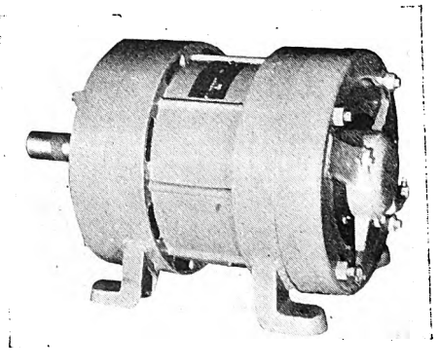


This type of electric handsaw is arranged with hand grips similar to those of an ordinary plane

Loose bearings—lose bearings

Rolled Steel Replaces Castings in Motor Construction

A COMPLETE line of polyphase induction motors in which gray iron and malleable castings have been replaced entirely by rolled steel is announced by the Lincoln Electric Company, Cleveland, Ohio. It is claimed that the various motor parts are more than twice as strong as the former types built with cast-iron framework. Economies in the new process have permitted the use of much larger shafts and bearings than are usually found with this type of equipment.



All-steel motor constructed of rolled steel shapes welded together

Owing to greater strength of steel as compared with cast iron, less thickness of metal is required in the frame. It is claimed that the increased ventilation so obtained results in a considerable increase in the overload capacity of the motor so that a continuous overload of from 10 to 15 per cent can be handled.

Association Activities

The Sale of Railway Advertising Space*

By H. Samuelsen
Managing Director Oslo Tramways, Oslo, Norway

BASED upon 150 sets of replies to a questionnaire on car publicity, it appears that the profitable sale of advertising space under continental conditions demands that an electric railway serve 100,000 or more inhabitants.

Thirty-one (20 per cent) of the members said that they sold no advertising space, but this group includes several properties that are forbidden to do so.

Twenty-three (15 per cent) handle their advertising direct. This group includes such large cities as Basle, Duisburg, Kiel, Königsberg, Oslo, Utrecht and Zurich. On seven (5 per cent) of the properties, the advertising is handled by a subsidiary, as at Amsterdam, Elberfeld, Magdeburg and Munich.

The majority or 97 (about 66 per cent) of the properties lease their space through advertising agencies more or less territorial in character. This is the practice in such very large cities as Berlin, Hamburg, Stockholm and Copenhagen.

Standardization of Spaces Would Help Revenue

More revenue would accrue from car-body and platform advertising if the size and placing of the car card panels were standardized. The railway ought to retain such control over the shape, size, color and text of the announcements that it would not be possible—as has occurred—for them to become an annoyance instead of an attraction to the riders. A railway planning to handle advertising directly must not forget that this implies the employment of an advertising specialist and the use of art work. Furthermore, such a department should be made to stand upon its own bottom, because revenues from this source are likely to be fluctuating.

At present Oslo is handling its advertising through a subsidiary company. For a number of years its space was sold through a general advertising agency. This plan worked well enough for a time, but when business became slack, the advertising agency — which dealt with other kinds of advertising mediums as well—spent its advertising appropriations on them rather than with the railway.

The contractor had the advertising privileges on the backs of the fare receipts and tickets as well as in various ceiling, window and door spaces on the cars and, in part consideration, the receipts and tickets were printed without cost to the railway. The plan of handling the advertising in Oslo through a subsidiary is still on trial. It is in direct charge of an advertising specialist who is largely on a commission basis. So far, however, the fluctuations in the prices of merchandise due to shifts in the value of Norwegian money have made advertising solicitation very difficult.

The Various Forms of Car Advertising in Use

A list of various forms of European car advertising follows:

Within the car a most popular form is that of transparencies set in the upper window frames. These should be readily interchangeable and be protected against damage from water. Another form, of course is that of car cards or panels, set at convenient places along the sides and ends inside of the car. A third are ceiling car cards. As a rule, the so-called "permanent" advertisements with special lighting effects and the like are not desirable, because frequent change of copy is essential to the drawing power of advertising.

Almost all street railways make use of paper transparencies, and also of etching or sanding on glass. Several properties sell space on a clock hung from the center of the car ceiling.

Some cities, including Munich, forbid advertising on the outside of cars from esthetic considerations. On the other hand, Oslo and Budapest have long made use of illuminated roof side signs for advertising purposes. In Oslo, these signs are 3m. (9.8 ft.) long. Such signs are not recommended from an operating standpoint because they interfere with the route and destination signs. Colored roof signs without illumination are preferable. The confusion from illuminated roof signs might be overcome if the color of the lighting could be varied according to the route. Of 80 replies concerning outside advertising, 50 stated that they were users, but only Oslo and Budapest illuminate such advertising.

A few operators sell advertising space on the trolley pole (or bow collector). Dasher signs are very much worthwhile, but little progress seems to have been made in standardizing on size and in providing neat frames.

In Oslo, the vestibule sash carries an advertising structure which also serves as a sun visor for the motorman! Several operators have found room for advertising on the car trucks. However, it is possible that advertising will be so overdone that a car will lose whatever attractiveness it might have otherwise.

Recently, the Oslo Street Railway and the Norwegian State Railways (in its local stations) have added flashing or blinking advertisements in which the source of light is placed behind a mirror carrying the photograph, colored picture, lettering, etc. The subject is drawn double, so that it is visible in different ways, either through use of the special lighting source or by means of daylight or standard car illumination. These flashers are rented from the patentee on a 7½ per cent royalty basis.

A special charge is made in Oslo for placards advertising sporting events or other stimulators of "crush" traffic, on the theory that the cost of handling the ensuing peak service will be greater than usual. Little use has been made of outside placards along the car body. Suitable frames might develop this kind of publicity.

The Oslo system illuminates the car steps and offsets the cost by selling the riser space for advertising. It also sells advertising space on the car straps, which seem an especially desirable location for advertisements of gloves and manicure preparations. On the handholds on its cars, the Oslo system carries placards urging the user to "hold fast" to the article advertised. The use of lamp bases for Oslo car advertising is gradually declining.

A number of electric railways use enamel shield advertisements along the top edge of transverse car seats. Roof pennants are used occasionally in connection with the advertising of sporting events. They may be made of cloth,

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Aug. 4*—New England Street Railway Club, annual outing, Whalom Park, Fitchburg, Mass.**

***Aug. 18-19*—Wisconsin Utilities Association, Transportation Section, annual convention, Hotel Pfister, Milwaukee, Wis.**

***Sept. 1-4*—Tenth Annual Conference on Human Relations in Industry, Silver Bay on Lake George, N. Y.**

***Sept. 8*—Central Electric Railway Master Mechanics Association, South Bend, Ind.**

***Sept. 13-15*—International City Managers Association, Dubuque, Ia.**

***September 19-23*—American Welding Society, national meeting, Book-Cadillac Hotel, Detroit, Mich.**

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Digitized by Google

metal, cardboard or fiber. The panels of platform doors and roller curtains also serve as advertising spaces at Oslo.

A clause in the Copenhagen contract requires the advertising agency to fill unsold roof spaces with ride-stimulating photographs of city attractions.

Dresden paints advertisements on the outside main panels of its cars. Oslo permits the outside of its cars to be covered with bunting, special signs or the like for advertising purposes. This latter is one form of theater advertising. In some instances, advertising space is sold on the face as well as the back of tickets and fare receipts.

Advertising Spaces in Addition to Car Use

In recent years there has been developed a sidewalk post style of advertising which combines the merit of indicating stopping places, car routes etc., with the production of advertising revenue. These poles or columns are of a porcelain-like material, which can be readily illuminated. Such columns are in use, or said to be under way, at Oslo, Amsterdam, Berlin (a pioneer), Dresden, Hamburg, Jena, Crefeld, Ruhr District, Magdeburg, Mannheim, Düsseldorf, Stettin and Stuttgart among others. Most of these four-sided columns are furnished by their different manufacturers on a rental basis.

The value of this type of publicity depends on the amount of competition. At Oslo, for example, its value would be little because advertisements are already carried on all of the city lampposts and trolley span wires. At Timisoara, Rumania, these posts are combined with illuminated clocks.

To some extent, space on the street span-wire poles has been sold for advertising. Span-wire advertising is usually of timely character, such as advertising an entertainment by means of pennants, flags, banners, etc.

Extended use of advertising space is made on railway structures, of both passenger and service type. Some also use the smokestacks of their power stations. Outside advertising in a number of cities is subject to the approval of an art commission.

All work of this kind should be marked by modesty of statement and artistry of treatment in advertising, partly to enhance its value and partly to meet the growing demand for greater civic beauty.

Suggested Standard Classification of Operating Data*

By Dr. William Mattersdorf
Manager Hamburg Elevated Railways, Germany

FOR most practical purposes, electric railway statistics may be divided into two groups. The first are of the order gathered for the International Association by K. Norregaard, managing director of the Copenhagen Tramways, and may be called "international" statistics. They include the following:

1. Number of inhabitants served.
2. Route length.
3. Vehicle-miles.
4. Tickets (or fare receipts) sold.
5. Revenue.
6. Total rides.
7. Annual rides per inhabitant.

**Abstract of report made to Copenhagen convention of the Internationaler Strassenbahn- und Kleinbahnverein, June 22-24, 1927. In the tables the English terms of weights, measures and money have been substituted for the German terms, to make the article more easily read in America.*

Table of Suggested Standard Classification of Statistics

OPERATION

	Unit Employed
A—Equipment	
1—Amount of rolling stock, including reserves, per mile of route:	
(a)—Motor cars or locomotives	Number
(b)—Trailers or freight cars	Number
2—Proportion	
(a)—In use	Per cent
(b)—In repair	Per cent
(c)—Available for service	Per cent
3—Average schedule speed	Miles per hour
4—Average daily performance per vehicle in operation	Miles
5—Average number of cars per train	Number
B—Transportation Personnel	
6—Per mile of route	Number
Per car (total number of cars to be taken)	Number
Per passenger	Number
Per ton hauled	Number
Conductors per 10,000 vehicle-miles	Number
Motormen per 10,000 vehicle-miles	Number
7—Proportion of sick-leave days to working days	Per cent
Proportion of "days off" and vacations to working days	Per cent
C—Operating Performances	
8—Motor car miles per mile of route	Miles
9—Passengers carried or tons of freight moved	
(a)—Per car-mile	Persons or tons
(b)—Per mile of route	Persons or tons
(c)—Per car	Persons or tons
(d)—Per seat	Persons or tons
10—Cash passengers per car-mile	Persons
11—Pass and special-rate ticket users per car-mile	Persons
D—Operating Results	
12—Total revenue per revenue car-mile	Cents
Total revenue per passenger	Cents
Total revenue per ton of freight moved	Cents
13—Total expenses per active car-mile	Cents
Total expenses per passenger	Cents
Total expenses per ton of freight moved	Cents
14—Net income ratio, or total cost (including interest, taxes, etc.) divided by the total revenue.	

POWER

	Unit Employed
1—Power Plants Operated	
Number of power stations	Number
Type of current generated	A.C.—D.C.
Voltage generated	Volts
Amount generated	Kilowatt-hours
Number of substations	Number
Direct current voltage	Volts
2—Purchased Energy	
Type of current	A.C.—D.C.
Voltage	Volts
Quantity	Kilowatt-hours
3—Personnel in Operator's Power Department	
Personnel for generating and distributing 100,000 kilowatt-hours at feeder points	Employees
Proportion of supervisory personnel to workmen	Per cent
Proportion of sick-leave days to working days	Per cent
Proportion of "days off" and vacations to working days	Per cent
4—Energy Consumption	
From own plants	Kilowatt-hours
Purchased	Kilowatt-hours
Proportion of own energy used for traction	Per cent
Proportion of purchased energy used for traction	Per cent
Proportion of all energy used from own plants	Per cent
Proportion of all energy used from purchased sources	Per cent
Proportion of total requirements delivered to others	Per cent
Energy consumption per motor car-mile	Watt-hours
Energy consumption per "Calculated" car-mile (in which a trail car-mile is calculated as one-half a motor car mile)	Watt-hours
Energy consumption per ton-mile	Watt-hours
5—Check on Energy Consumption	
Proportion of trailers per 100 motor car-miles	Per cent
Average load per car-mile, all types together	Persons
Average load per "Calculated" car-mile (estimated as above)	Persons
Energy consumption per passenger	Watt-hours
Average schedule speed	Miles per hour
6—Technical and Economic Data	
Average load of own power plants	Kilowatt-hours
Load factor of own power plants (average load divided by total capacity)	Per cent
Maximum load	Kilowatt-hours
Efficiency of generating-distributing system, viz., high tension—substation—low tension	Per cent
Coal consumption per kilowatt-hour generated	Pounds
Steam consumption per kilowatt-hour generated	Pounds
Steam per pound of coal	Pounds
Heat value of coal	B.t.u.
Cost of coal per ton	Dollars
Average monthly cost per kilowatt-hour of power as generated or purchased	Dollars
Proportion of cost due to fuel	Per cent
Proportion of cost due to labor and upkeep	Per cent
Cost of generated and purchased power per kilowatt-hour at railway feed-in points	Dollars
Coal-price clause as affecting:	
Power sold to others	.....
Power bought from others	.....

TROLLEY DISTRIBUTION SYSTEM

1—Personnel (inspectors, also day laborers excluding tower truck drivers)	
Skilled workers per 1 mile of track length	Employees
Laborers per 1 mile of track length	Employees
Proportion of sick-leave days to working days	Per cent
Proportion of "days off" and vacations to working days	Per cent
Proportion of supervisory personnel for construction and upkeep to skilled workers	Per cent
2—Proportion of night-work hours to day hours	Per cent
3—Proportion of system equipped with two trolley wires	Per cent
4—Weight of trolley wire per running foot	Pounds
5—Average life of wire previous to renewal	.....
(a)—If rolling contact is used	.....
(b)—If sliding contact is used (aluminum)	.....
(c)—If sliding contact is used (carbon)	.....
Defects per 1 mile of track	.....
(a)—Contact wire breaks	.....
(b)—Span or other auxiliary wire breaks	.....
(c)—Insulation breaks	.....
(d)—Breaks of protective netting (trolley guards)	.....
7—Trolley feeders per 1 mile of track	Number
8—Copper core of feeder cables per 1 mile of track	Tons
9—Number of feeder points in the return circuit per mile of track	Number
10—Copper core of return cables per 1 mile of track	Tons
11—Cost of distribution system per 1 mile of track	.....
(a)—Maintenance	Dollars
(b)—Renewals	Dollars
(c)—Correction of interruptions	Dollars
(d)—Construction	Dollars

Table of Suggested Standard Classification of Statistics (Continued)

ROLLING STOCK MAINTENANCE

1—Personnel of shops and carhouses, including all employees:
(a)—Per 1000 total vehicle-miles, counting all cars alike... Employees
(b)—Per 1000 "Calculated" car-miles (counting trailer-miles as half a motor car-mile)..... Employees
(c)—Per car total..... .....
(d)—Per car (trailers counted as half a motor car)..... .....
Proportion of supervisory personnel to workers..... Per cent
2—Proportion of sick-leave days to working days..... Per cent
Proportion of "days off" and vacations to working days... Per cent
3—Proportion of shop working hours used for other subdivisions and for other departments like overhead, way and structure, etc..... Per cent
4—Average number of car-miles between main overhauls:
(a)—Motor cars..... Car-miles
(b)—Trailers..... Car-miles
5—Time between main overhauls:
(a)—For motor cars..... Months
(b)—For trailers..... Months
6—Monthly proportion of service and testing vehicles to total rolling stock:
(a)—To motor cars..... Per cent
(b)—To trailers..... Per cent
7—Monthly proportion of passenger cars put through paint shop:
(a)—Motor cars..... Per cent
(b)—Trailers..... Per cent
8—Cost of painting passenger cars per 1000 vehicle-miles (counting a trailer as one-half a motor car)..... Dollars
9—Maintenance of equipment:
(a)—Axle defects per 1000 car-miles..... Number
(b)—Armature repairs per 1000 car-miles..... Number
(c)—Dropped armatures per 1000 car-miles..... Number
(d)—Field repairs per 1000 car-miles..... Number
(e)—Electric track brake repairs per 1000 car-miles..... Number
(f)—Collisions causing damage, per 1000 car-miles..... Number
(g)—Cost of collision damage per 1000 motor car-miles.... Number
10—Renewal of equipment parts:
(a)—Armature bearings per 1000 car-miles..... Number
(b)—Motor axle bearings per 1000 car-miles..... Number
(c)—Pinions..... Number
(d)—Gears per 1000 car-miles..... Number
(e)—Gear cases per 1000 car-miles..... Number
(f)—Journal bearings per 1000 car-miles..... Number
(g)—Wheel (tire) life per 1000 car-miles..... Number
11—Proportion of roller bearings to total:
(a)—For motors..... Per cent
(b)—For axles..... Per cent
12—Proportion of different types of brakes in all cars:
(a)—Air brakes..... Per cent
(b)—Short-circuiting motor brakes..... Per cent
(c)—Electric brakes using line current..... Per cent
13—Main items of consumption:
(a)—Lubrication per 1000 motor car-miles..... Pounds
Lubrication per 1000 "Calculated" car-miles (trailer counted as one-half of motor car)..... Pounds
(b)—Brakeshoe wear per 1000 motor car-miles..... Number
Brakeshoe wear per 1000 "Calculated" car-miles..... Number
(c)—Electric track brakeshoes per 1000 motor car-miles.... Number
Electric track brakeshoes per 1000 "Calculated" car-miles..... Number
14—Life of different materials, according to this formula: Car-miles x number of cars divided by consumption
(a)—Wheels (tires)..... Miles
(b)—Gears..... Miles
(c)—Pinions..... Miles
(d)—Motor brushes..... Miles
(e)—Aluminum trolley contactors or bows..... Miles
(f)—Carbon trolley contactors..... Miles
(g)—Rolling contactors (or trolley wheels)..... Miles
(h)—Brakeshoes..... Miles

MAINTENANCE OF WAY

(By sections, type of rail, etc.)

1—Average monthly ton-miles load per mile of track..... Ton-miles
2—Maximum speed..... Miles per hour
3—Proportion of rail 45 to 60 ft. long..... Per cent
4—Rail joints per mile of track..... Number
5—Rail welds per mile of track:
(a)—Thermit..... Number
(b)—Electric..... Number
6—Number of switches per mile of track..... Number
7—Number of crossings per mile of track..... Number
8—Personnel per mile of track:
(a)—Along the line..... Number
(b)—In the shops and yards..... Number
9—Proportion of supervisory staff in construction and maintenance of workmen..... Per cent
10—Proportion of sick-leave days to working days..... Per cent
Proportion of "days off" and vacations to working days... Per cent
11—Proportion of night-work hours to day hours..... Per cent
12—Proportion of total work given out on contract..... Per cent
13—Expenses per mile of track:
(a)—Maintenance..... Dollars
(b)—Renewals..... Dollars
(c)—Construction..... Dollars
(d)—Corrugation removal..... Dollars
(e)—Track cleaning (and greasing?—Editor)..... Dollars
(f)—Snow removal..... Dollars
14—Life of straight track:
(a)—In monolithic construction..... Years
(b)—On broken stone..... Years
(c)—On longitudinal stringers..... Years
(d)—On wooden cross-ties..... Years
(e)—On metal ties..... Years

8. Rides per mile of route.
9. Revenue per vehicle-mile.
10. Revenue passengers per vehicle-mile.
11. Average fare per passenger.
12. Number of passenger vehicles.
13. Vehicle capacity.
14. Schedule speed.
15. Kw.-hours per vehicle-mile.

These "International" units are of widely comparative nature. In addition, the manager of a property must set up a series of units that will enable him to judge the operation of his own undertaking.

In a paper presented at the 1921 convention the author recommended international standardization of report forms, schedule-making, etc. This proved too comprehensive, but the Verein der Deutschen Strassenbahnen (German Street Railway Association) had standardized on forms for operating data and is using them for interchange of information among its members. Later, the valuable suggestion was made that there be a clearing house of such facts. Small properties could use a briefer form of such statistics to advantage. In general, also, it is better to concentrate on a few items and follow their course intensively than to try to cover everything.

A tabulation of operating data, as approved by the German Street Railway Association for both passenger and freight service, appears on this and the preceding page. The more general use and publication by the different companies of such statistics of their properties should be of great mutual advantage.

Annual Vehicle-Miles per Platform Man in Europe*

By Dr. A. Winter

Secretary Internationaler Strassenbahn- und Kleinbahnverein, Vienna Tramways

BASED upon the questionnaire of conditions in 1925, prepared by K. Norregaard, Copenhagen, the author has prepared the following data to show the relation between schedule speed and the effective yearly mileage per platform man.

Of six railways (members of the association) whose schedule speed is within 12 km. (7.44 miles) per hour, three secured 30,000 car-km. (18,600 car-miles) per man and one attained up to 35,000 car km. (22,700 car-miles).

Of 23 railways whose schedule speed is within 13 km. (8.06 miles) per hour, eight attained 30,000 car-km. (18,600 car miles), ten attained 35,000 car-km. (22,700 car-miles) and three attained 40,000 car-km. (24,800 car-miles) or more per operative.

Of 25 railways whose schedule speed was 14 to 15 km. (8.68 to 9.3 miles) per hour, nine attained 35,000 car-km. (22,700 car-miles) and nine attained 40,000 car-km. (24,800 car-miles) or better.

No distinction has been made in this tabulation between street railways and those over private right-of-way, but it is noteworthy that of the twelve higher-speed lines remaining, four had an average of 35,000 car km. (22,700 car-miles), and seven of 40,000 car-km. (24,800 miles) or more per platform operative.

The mileage output per man is dependent not only on schedule speed, but also on the practice with regard to "days off" and length of vacations. Analysis of the 62 undertakings which reported on this aspect of operation indicated that there was no definite relation between number of single "days off" and length of vacations.

The vacation period was found to have the extraordinary range of three days to 30 days, but as an indication of the more customary periods, nineteen operators reported vacations of ten to twelve days, while the corresponding individual "days off" varied from 26 to 61. A second group of ten roads reported vacations of thirteen to fifteen days with individual "days off" ranging from 36 to 56 with a maximum of 91 per annum on Scandinavian or Far North railways.

Fifteen railways had vacations ranging from three to nine days; and eighteen railways had vacations exceeding fifteen days.

[Editor's Note: While Dr. Winter's report does not specifically so state, it is probable that a number of properties on which vacations exceed two weeks grant more than one vacation period in the course of the year, as at Easter.]

*Abstract of report made to Copenhagen convention of the Internationaler Strassenbahn- und Kleinbahnverein (International Street and Interurban Railway Association), June 22-24, 1927.

News of the Industry

Talk Renewed in Chicago

Councilmen decide to draft own transit bills—Defer consideration of railway negotiations until Aug. 17

NEGOTIATIONS between the local transportation committee of the City Council and representatives of Chicago's electric railway and motor coach lines for an agreement as to what legislation shall be submitted to the special session of the Illinois Legislature next October in order that the city's transportation problems may be settled were postponed until Aug. 17, after a brief session on July 25. This was the first joint conference to be held since the demise of the five traction bills in the Legislature a month ago. Further action was deferred with the understanding that the five defeated bills will be at once submitted to the Corporation Counsel for an opinion on their constitutionality. When the city attorney's report is received the local transportation committee has decided to draft its own program and then submit it to the companies for approval, modification or rejection.

This course was determined upon when company representatives informed the committee that their views were and still are incorporated in the five traction bills. Speaking for the Chicago Surface Lines, Attorney James M. Sheean declared that the companies have not yet had an opportunity to examine the amendments attached to the bills in the House of Representatives. Feeling on the part of several Aldermen that the traction bills were defeated because the legislators believed they did not have the support of the Chicago City Council was another factor in the decision to let the transportation committee draft its own legislation. The plan was heartily indorsed by Leonard A. Busby, president of the Chicago City Railway, and Britton I. Budd, president of the Chicago Rapid Transit Company. Both declared that they did not believe the companies and the City Council were at any great variance on the fundamental questions involved.

All talk of submitting the ordinances to the voters prior to the enactment of enabling legislation was dropped by the Aldermen and company delegates at this conference. Both sides are now agreed that the laws should first be obtained at the special legislative session next October, leaving the ordinances based thereon for referendum action at a later date.

Aside from the problem of drafting new bills for the local companies, the transportation committee still has three other propositions to consider before a final settlement is reached. The first is the plan of the F. J. Lisman interests of New York, which contemplates consolidation of all lines under a twenty-year franchise. The two other schemes are that of Michael J. Flaherty, president of the Board of Local Improvements, to construct a system of downtown subways by special assessments under existing legislation, and that of Alderman Leonard J. Grossman, who last week presented plans of unnamed Eastern bankers for the construction of $460,000,000 of subways, covering the entire city, if granted a 50-year franchise.

Utility Helps City Park System

The Wisconsin Valley Electric Company has presented to the city of Wausau two small islands in the Wisconsin River. One is Stack Island, which lies west of Oak Island, now the property of the city, and the other is government lot No. 4, an unnamed island. The two islands are considered valuable additions to the Wausau city park system, as in time they can be beautified and made into recreation grounds.

Mayor Intervenes in New York

Arranges settlement at last minute that averts strike threatened by Amalgamated on Interborough—Amalgamated and company interpret promises differently

LATE on the afternoon of July 26, Mayor Walker of New York intervened and averted the issuance of a strike call to Interborough Rapid Transit Company employees at midnight by the Amalgamated Association. The Mayor succeeded in getting the Interborough to agree to re-employ thirteen men discharged earlier in the day for refusing to instruct strikebreakers and for attending a meeting of the Amalgamated the previous Friday night, and not to discriminate against them for membership in or sympathy with the Amalgamated. He also extracted a promise from the Amalgamated officers that they would, so far as was in their power, not raise the issue of union organization until the city's unification plan was completed. The summary dismissal of thirteen employees by the Interborough on July 26 hastened the crisis, and Amalgamated leaders declared during the day and as late as 3 p.m., when they went into conference with the Mayor, that the strike could no longer be averted.

In his letter to the men dismissed for attending the union meeting, President Hedley of the Interborough informed them that they had broken their agreement with the company. In a supplemental statement, Mr. Hedley asserted that no attention would be paid to the Amalgamated, and that any employees who may "become identified in any manner with that organization will break their contracts and be dismissed."

It was this situation that confronted the Mayor when he met the union officials shortly after 3 o'clock. He had on his desk the refusal of Mr. Hedley to appear, and also that of William S. Menden, president of the B.-M. T.

The Mayor pleaded with the leaders not to call a strike because of the city's pending unification plans and the project of the independent subway system. He pointed out that during his sixteen years of service in the State Legislature he had proposed many bills favoring organized labor. He told them of the great inconvenience that would be caused to millions by the strike. For the Interborough Mr. Quackenbush, general counsel, agreed the company would take back the discharged men without prejudice or discrimination against them for union activity.

General Organizer Coleman of the Amalgamated said:

> I consider this an important victory. It means that we can go right ahead organizing, secure in the knowledge that there will be no discrimination against our members on the Interborough and that any employees who are not members will be able to join our ranks without fear of discharge. What we sought was recognition, and we have got it.

The following day Mr. Coleman and Patrick Shea, leaders of the Amalgamated, summarized their viewpoint in the following statement, in the form of questions and answers:

Q.—Will you state clearly what was your understanding with the Mayor?

A.—We agreed to call off the strike last night if the companies in their turn agreed to this, as stated in the language of the Mayor in conversations with us, with officials of the companies and with newspaper reporters: "That every man discharged would be restored to his place and that no discrimination would be practiced against any employee of the companies because of his sympathy with or membership in the Amalgamated."

Q.—Did you give the Mayor an unconditional promise not to strike?

A.—We did not give an unconditional promise on any point. Every promise made was strictly conditioned upon fulfillment of promises made by the other party to the verbal agreement, and it was understood that each party placed himself under moral obligation to the Mayor to abide by these conditions.

Q.—What is your understanding of you. obligations under this agreement?

A.—We will carry out every obligation stated by the Mayor, in so far as it lies within our power, as long as the companies

Digitized by Google

carry out their obligations, as stated by the Mayor to us. In the event that the companies violate the agreement we will go directly to the Mayor with the grievance in compliance with a request made by him to us.

Q.—Would you consider the discharge of one of your members by the B.-M. T. or the I. R. T. as sufficient provocation for a strike?

A.—The Amalgamated always protects its members. That is its fundamental policy and its pride. But we have promised the Mayor that we will first come to him with any grievance, based upon violation of this agreement by either company. We are going to keep faith with the Mayor and follow out this agreement to the letter—and the agreement is clear if one wants to read it correctly.

How Counsel for the Company Sees It

Informed that Mr. Coleman had interpreted the Mayor's announcement to permit the Amalgamated to organize I. R. T. employees, Mr. Quackenbush said:

That is not the case, and it is what I expected. The Mayor, when he spoke to me, asked that no discrimination be made against the thirteen men who were discharged, and that, specifically, is all we agreed to do in that particular. The Amalgamated will break its promise if it attempts to organize I. R. T. employees, and will cause a reopening of this situation.

The attitude of the Interborough as stated by President Hedley to the Mayor was as follows:

Dear Mr. Mayor: I see that you have been requested by representatives of the Amalgamated to invite me to come to your office this afternoon (Saturday) for a conference with you in an effort to persuade those representatives from calling a strike upon the railroads operated by I. R. T.

I deem it my duty promptly to advise you that I must respectfully decline to attend any such conference for the following, among other, reasons:

The Amalgamated Association pretends to represent a majority of our employees but does not, in fact, represent enough employees of the Interborough to make any serious impression upon our operations if every one of them quit work.

On the other hand we have 12,673 loyal employees with whom we have amicable relations who have within the last few days reaffirmed their allegiance and expressed their satisfaction with the terms and conditions of their employment by the execution of a new contract of employment extending to April 30, 1929.

By the terms of this contract (which makes the constitution of the Brotherhood of Interborough Rapid Transit Company employees a part thereof) it is expressly agreed that no employee will become a member of or identified in any manner with the Amalgamated Association.

Employees Resentful of Amalgamated Interference

This brotherhood has been in existence since 1916. It was organized by our employees as a protest against the actions of this Amalgamated Association during the strike which that organization conducted in this city that year.

I am sure that at least 97 per cent of our employees would regard as a great breach of faith on my part any transactions either directly or indirectly with representatives of the Amalgamated Association.

I feel I am in a position to assure you that with adequate police protection, which I am certain will be afforded, no strike which the representatives of this Amalgamated Association can bring about will amount to any serious inconvenience to the people of this city, as far as the Interborough System is concerned.

As evidence of the correctness of this view permit me to call your attention to the fact that the much-heralded great mass meeting called last night in Brooklyn failed to muster more than 150 people in the hall during the entire night. Not more than eight employees of the Interborough were there, except those who were there to observe what took place.

I believe that the best interests of the public will be served by such actions on my part as will assure the continued good will of the Brotherhood of Interborough Employees. They have a contract which provides for collective bargaining and arbitration of disputes. The Amalgamated Association seeks to destroy this good will and to procure a breach of that contract. It is my duty to our men and to the public, as I see it, to have nothing to do with such wrongdoers.

The Supreme Court of New York has enjoined interference with the relations between the Interborough and its employees and the conduct of the Amalgamated representatives and of those aiding and abetting them is in contempt of that injunction, I am advised by counsel.

In view of all the circumstances I most respectfully request you to refrain from inviting me to any meeting having to do with the affairs of this Amalgamated Association.

At any time that you desire to see me on any other subject you may be sure of my immediate attendance.

Another Move in Seattle Litigation

Dormant for several weeks, Seattle's drawn-out railway litigation reappeared in federal court recently when J. G. Von Herberg, through his counsel, Robert P. Oldham, filed an answer in the case originally brought several months ago by Von Herberg to restrain the city's paying off its railway indebtedness until operation expenses are met. Von Herberg urges that the decree of *pro confesso* entered about a month ago against the Von Herberg suit be set aside. The matter was taken under advisement.

The decree was entered after more than 30 days had passed without Mr. Oldham attempting to file an answer to a cross-complaint entered by the Puget Sound Power & Light Company. Attorneys for the power company contended that they had informed Mr. Oldham several times that they were awaiting an answer to their cross-complaint. When none was filed they asked for the decree of confession.

Judge Neterer informed counsel for both litigants that he was anxious to get all motions and preliminary matters cleared away in order that the litigation could be decided on its merits when Circuit Judge Frank H. Deitrich arrived in Seattle for this purpose next month.

The issue which Judge Neterer desires to have settled is whether the bondholders or labor has the first lien on the gross revenues.

Bus and Subway Matters Approved

Board of Estimate finally grants operating right—Certificates of convenience still necessary

Mayor Walker of New York on July 28 succeeded in getting the Board of Estimate to award the bus franchise for Manhattan, Brooklyn and Queens to the Equitable Coach Company, the applicant he has favored from the start. The board also awarded the Bronx bus franchise to the Surface Transportation Corporation, a subsidiary of the Third Avenue Railway, and the bus franchise for Staten Island to the Tompkins Bus Corporation.

Earlier in the day the board approved plans for a complete subway system for Brooklyn consisting of eight routes, which will cost about $150,000,000 and will provide about 25 miles of new subways. Among the lines approved was the Fulton Street subway, construction of which is expected to lead ultimately to the elimination of the Fulton Street elevated line.

Crosstown Routes in Manhattan

The franchise granted the Equitable Company is for the routes originally proposed by the Board of Transportation, except that the longitudinal routes in Manhattan have been eliminated, leaving only the crosstown routes in this borough. This is in accordance with the proposal of Borough President Julius Miller, who at first sponsored the application of the Manhattan Surface Coach Company, a subsidiary of the New York Railways and the Fifth Avenue Coach Company.

The Equitable Coach Company under the terms of its franchise will operate seven crosstown routes in Manhattan, 24 in Brooklyn and 25 routes in Queens. The fare will be 5 cents with three zoned routes in Queens. The charge for transfers will be 2 cents. The right to operate is for five years with the privilege of renewal for five years.

The financing of the company is guaranteed by J. G. White & Company and the operation will be by the J. G. White Management Corporation. John H. Pardee, president of the Management Corporation, said the company deeply appreciated the action of the Board of Estimate in granting the franchise. He added:

The responsibilities which must be assumed under this franchise have been and are fully realized, and we wish to assure the public that the statements and promises which have been made during the past eighteen months of negotiations were made with full realization of such duties and responsibilities, and that the public will be more than satisfied with the bus system which will be established under such franchise.

The Surface Transportation Corporation will operate twelve routes in the Bronx. It will charge a 5-cent fare with four zoned routes and will give the city 5 per cent of its gross receipts.

The Tompkins Bus Corporation will operate eighteen routes on Staten Island.

Digitized by Google

It will charge a 5-cent fare, give free transfers and give 3 per cent of its gross receipts to the city.

The Equitable Company, the Surface Transportation Corporation and the Tompkins Bus Corporation will apply at once to the Transit Commission for certificates of convenience and necessity. The commission's approval of the franchise holders' proposed methods of financing also is required. John H. Delaney, chairman of the Board of Transportation, expressed belief that the commission would deal with these matters expeditiously.

Many Physical Changes Recommended in Louisville Report

L. Segoe, city planner and traffic expert, and his assistant, H. H. Hemmings, employed by the Mayor's traffic committee some months ago to make a survey of the traffic situation in Louisville, Ky., recently completed their report. The findings have since been delivered and have been approved by the committee, which has been working on the plan for an improved traffic situation.

The report that has been approved is the first of two sets of findings to be made. It recommends many physical changes and many modifications on modes of handling traffic, and suggests traffic ordinances. The document contains about 60,000 words, with many diagrams and maps. The second report will deal with the future of traffic and is more of a city planning report. It will be filed later. The first report has now gone to Mayor J. T. O'Neal, with the committee's recommendations and full approval.

The most radical measure contained in the proposal would be that of taking the double car tracks off Fourth and Fifth Streets, replacing north and south lines with a single northbound line in the center of Fourth Street, and a single line, southbound on Fifth Street, extending from St. Catherine Street, to Main Street, a distance of about 1 mile, or through the business district and for about four to five blocks South.

One-way lines have been strongly opposed by the Louisville Railway and are also being strongly opposed by the Fourth Avenue merchants, as Louisville is virtually a one street town north and south, in so far as business is concerned. Changing its tracks would require the railway to build about a half-mile of line on Fifth Street and relay 1½ mile of double track line into a one track line.

The report suggests rerouting several of the existing car lines, and calls for safety islands along many of the railway lines on the more traveled streets. Trucks and wagons would be restricted to certain streets, during certain hours, and pedestrians would be forced to obey traffic signals. There would be a change made in boulevards, with some new ones.

Right-hand turns would be permitted at all intersections, but most left-hand turns prohibited in the congested section. There are 110 suggestions embodied in the first report.

Progress on Plan to Use Newark Canal Bed

Another conference in the series which have been held between representatives of the city of Newark, N. J., and the Public Service Railway on proposed plans to use the Morris Canal bed for railway service took place on July 21. Among the participants were Chief Engineer Costello, Corporation Counsel Congleton and Colonel Thomas F. Sullivan, chairman of the Boston Transit Commission and consulting engineer for the city, and Matthew R. Boylan, vice-president of the railway, and Martin Schreiber, superintendent of maintenance for the company. The conference was given over to a discussion of the details of the layout of the system. This took the conferees over types of construction, trackwork and platforms. Particular attention was paid to the advisability of laying out the system in the canal bed and constructing the platforms so that they could be used for a high-speed subway service that might be developed later. The work of preparing the contracts between the city and Public Service is now under way under direction of Mr. Congleton.

Two-Year Agreement in Providence Carries Increase

Acceptance of a new wage scale and working conditions agreed upon by the union officers and representatives of the United Electric Railways, Providence, R. I., featured two meetings, held on July 18 and July 19. The agreement is for two years. It carries a general increase of 2 cents an hour in all organized departments and is retroactive to June 1, 1927, a further increase of 1 cent an hour to take effect June 1, 1928.

Under the old scale, which expired at midnight on May 31, the rate of pay for motormen and conductors on two-man cars was 62 cents an hour, with one-man car operators and bus drivers receiving 68 cents an hour. Under the new agreement the two-man car operators will receive 64 cents until June 1, 1928, and one-man operators and bus drivers 70 cents. The rates from June 1, 1928, until the expiration of the agreement, May 31, 1929, will be 65 cents and 71 cents respectively. Similar increases will go into effect in the track, line, pit, freight and other departments, affecting a total of approximately 2,300 employees.

Among the provision looking toward better working conditions are the rearrangement of holiday and Sunday schedules; better pay for the men who operate the so-called "split runs" for the "intervals," or lost time between the time they complete a run on one route and take their cars out on another; a guarantee of seven hours pay for a thirteen-hour spread to spare conductors and motormen, one-man car operators and bus drivers for six days in each week and an additional seven hours pay if ordered to report for Sunday work; pay at the rate of time and a half for overtime in all departments, and a reduction in several departments in the working week of 54 hours, or six days of nine hours, to 50 hours, five nine-hour days and five hours on Saturdays.

This is the second time during the administration of the present board of officers that it has negotiated a wage agreement with the United Electric Railways over the conference table, without resorting to arbitration.

City Prepares Questionnaire in Buffalo Case

Corporation Counsel Frederic C. Rupp of Buffalo, N. Y., has prepared at the request of the City Council a questionnaire seeking information upon which the city expects to base its application for a return to the 8-cent fare. The compilation asks about 100 questions relating to allocation of properties of the International Railway, which recently was granted a 10-cent fare by the Public Service Commission, reproduction costs and valuation of specified portions of the company's property within the city of Buffalo. It has been sent to Michael F. Kearney, accountant for the state utilities board. Milo R. Maltbie, expert for the city, assisted in preparing the questions.

At the recent rehearing of the 10-cent fare case, the Public Service Commission granted the request of the municipal authorities to be permitted to question the state accountant about the property valuations of the railway.

Interurban Drops Passenger Service

Passenger service has been discontinued on the electric interurban of the Great Northern Railway, formerly the Inland system, between Spokane and Opportunity, Wash., a distance of about 15 miles. A private bus line will handle the business. Freight service will continue on the line. The Great Northern also dropped passenger trains between Spokane and Millwood and Pinecroft, about 10 miles, diverting that business to the bus line.

Work of Securing Rights-of-Way Being Pushed

According to information received at Winston-Salem, N. C., the officials of the Piedmont & Northern Railway are still securing rights-of-way for the proposed extension of the line from Charlotte to Winston-Salem. There has been no intimation as to what decision the Interstate Commerce Commission will reach in the contest entered by the Southern Railway and other steam railroads in their opposition to the building of what they term a competing road, but the towns and cities affected are known to be anxious to secure the new railway.

Peter Witt to Quit Cleveland Council—Too Many "Yes" Men

Peter Witt, well known in electric railway circles, and at one time street railway commissioner of Cleveland, Ohio, is going to quit the Council of Cleveland, in January. Philip W. Porter, writing in the Cleveland *Plain Dealer*, says Mr. Witt will serve out his present term, but will not run for re-election in November. When he quits, he will quit politics "for keeps" and return to his practice as electric railway consultant.

According to Mr. Porter, Mr. Witt's departure will take most of the fire and the zest out of the Council sessions. Despite the fact that he has been consistently steam-rollered for four years, "his sharp tongue and indeed his very presence has had a powerful effect." The interviewer quoted Mr. Witt to this effect:

What's the use? There is no possibility that the coming election will bring forth a Council that would be worth while to sit with. The same old gang will be back. When I decided to run four years ago, I expected it would be a pleasure to sit in Council. I expected that issues would be debated in the Council, and differences of opinion hotly but honestly fought. I found, instead, a majority of "yes men," of rubber stamps, doing exactly what the city manager wanted. If I ran again, I could accomplish no more. So I'm going to quit. When I'm a private citizen again I won't see so much and it won't worry me.

On his own account Mr. Porter said:

For seven years following his retirement as traction commissioner, Mr. Witt practiced as a traction consultant. He spent a great deal of his time in distant cities, and was engaged for street railway advice in Newark, N. J.; Seattle, Wash.; Lynn, Mass.; Youngstown, Philadelphia, and several other cities. He had a five-year contract in Philadelphia.

He intends to return to this profession, but he has also a sideline on which to concentrate. It is the promotion of the Automobile Owners Protective League, which he organized to support a constitutional amendment that will make taxation of automobiles impossible.

Fare Survey Being Made by Holyoke Street Railway

The Holyoke Street Railway, Holyoke, Mass., has been making a survey with a view to readjusting fares on its system, and it is expected that the new tariffs soon will be filed with the Public Utilities Commission. For about ten years this company has operated on 6-cent fares with a zone system, with no transfer privilege. Minor readjustments of the zone system are contemplated, chiefly to accommodate the needs of patrons living in expanded residence areas. City Hall is a fare limit on all lines at present, and the privilege of riding from there to Dwight and Race Streets, and vice versa, without paying an extra fare has been urgently sought by the patrons of lines running from the residence districts. This issue, arising from the fact that Holyoke has two long business streets separated to quite an extent by a canal system, is likely to come up anew in connection with the proposed readjustments. Further than that the zone system will remain substantially as it is. A move for an increase of fares is likely, but reports concerning the company's plans are indefinite.

Complainants Against Service Visited in New Jersey

A novel plan of handling complaints in connection with service on lines of the Public Service Corporation of New Jersey has been started by that company. The procedure is to forward a copy of the complaint to the supervisor in charge of the line, who makes a personal call on the complainant to explain the cause of the complaint and discuss the remedy. If the trouble is due to discourtesy the offending employee is expected to make such amends for his conduct as are possible by personal apology.

Passes Increasingly Popular on Stark Electric

After issuing unlimited-ride Sunday passes for little more than a year under the direction of F. W. Sweezy, general manager, officials of the Stark Electric Company, Alliance, Ohio, consider the plan successful for increasing revenue from week-end travel.

During the hot summer months the sale of Sunday passes shows a slump, caused by many people going out in machines or to near-by parks, but in spite of this, the average Sunday sale is nearly three times as great as was that of the first Sunday the passes were offered.

Besides the Sunday passes, the company offers the same rate for holidays. Adults pay 50 cents for any point on the interurban division, 32 miles in length, while children pay 25 cents. These tickets are good all day, for any number of rides.

The first Sunday, July 4, 1926, the company sold approximately 325 passes. Since then the sales have increased to about 1,000 passes during the spring months. At present, during the hot weather the average is about 800. Holiday pass sales reveal that 800 rode last Labor Day on passes; 530 on Thanksgiving; 590 on Christmas; 345 on New Year's and 350 on Washington's Birthday. The two main holidays this year have been on a Monday, giving two days of special passes. For Memorial Day there were 700 on Sunday and 750 on Monday. For July 4 there were 700 on Sunday and almost 1,100 on Monday.

The Stark Electric considers that by the pass system Sunday travel has increased at least 40 per cent. With this increase the reduced rate still shows a neat profit over the former Sunday business at ordinary rates.

In addition to the Sunday passes, the Stark Electric offers nine weekly passes for various points along the system. Practically all of them are considered profitable by company officials.

Increase in Rates Sought by Schenectady Railway

The Schenectady Railway, Schenectady, N. Y., on July 26 asked the Public Service Commission to determine a reasonable rate of fare on its lines in Schenectady, Albany, Rensselaer and Saratoga Counties under Section 49 of the public service commission law, and for authority to put such fares into effect under Section 29 of the same law.

The company says that in 1926 there was a deficit of $201,022 in its operating income and that its net operating income from 1920 to 1926 inclusive has been $92,198 for this period. It says that the rates of fare which it favors will not produce an annual operating income in excess of $360,000, a sum insufficient to give a reasonable return on the value of the property devoted to the public use.

The present rates in Schenectady are 7 cents full fare and 2½ cents for school tokens. The rates proposed are 10 cents full fare and 5 cents for school tokens. On the Albany division it is proposed to increase the full zone fare from 5 to 10 cents. Commutation tickets for 50 rides between stops 6 and 33 are proposed to be increased from $4.65 to $9.30; between stops 6 and 23 from $3.10 to $6.20 and between stops 14 and 33 from $3.10 to $6.20. On the Troy division zone fares are to be increased from 7 to 10 cents and commutation tickets, 50 rides, stops 10 to 42, from $5.50 to $7.80; stops 10 to 36 and stops 23 to 42 from $3.65 to $5.20 and the one zone school ticket from $2 to $2.50. On the Saratoga division zone fares are proposed to be increased from 7 to 10 cents and commutation tickets, 50 rides, as follows: Between Alplaus and Ballston Lake, from $2.75 to $3.95; Alplaus and Timesons, $4.50 to $6.40; Alplaus and Brookline, $6.75 to $9.65; Alplaus and Ballston Junction $9 to $12.85; Ballston Lake and Ballston Junction, $6.25 to $9; Ballston and Saratoga, twelve rides, $1.92 to $2.40, and one zone school ticket from $2 to $2.50.

Aurora-Elgin Line Plans Increase in Commutation Rates

Suburban commutation rates averaging 15 to 20 per cent higher than the present level will be established on Aug. 1 by the Chicago, Aurora & Elgin Railroad. Permission to increase the rates was granted by the Illinois Commerce Commission several months ago, but until now no action has been taken by the railroad.

According to figures presented in the petition filed with the commission on June 15, 1926, the average increase in costs of operation and other expenses has been more than 110 per cent since 1914, as compared with an advance of only 24.4 per cent in fares over the same period. It was pointed out that the increase would bring the rates of the line up to existing commutation rates of competing steam railroads. In

Digitized by Google

contending that earnings on the company's investment are grossly inadequate, the petition explained that the territory served by the line is one of the most prosperous sections in the country.

Smile with the Dallas Railway & Terminal Company

The Dallas Railway & Terminal Company, Dallas, Texas, has indorsed the habit of smiling. "Cut-out Cards," telling the difference between the number of muscles required to frown and the number to smile, have been placed on the telephones throughout the city with the compliments of the utility, "partners in the growth of Dallas."

Sales Talk to Baltimore Men in Book Form

"Selling Bus Business," is now in pamphlet form for ready use by the employees of the United Railways & Electric Company, Baltimore, Md. In a nineteen-page booklet these valuable sales points, thoughts of Dwight Burroughs, publicity agent of the company, and first printed in the company magazine, *Trolley Topics,* are attractively and succinctly presented. Reference was made to the employees' part in the selling of chartered bus service in the ELECTRIC RAILWAY JOURNAL, issue of July 9, page 79.

Skip Stops for Baltimore Upheld

An order granting permission to the United Railways & Electric Company, Baltimore, to continue the skip-stop system put into operation last November has been passed by the Maryland Public Service Commission. The skip-stop system is used during the morning and evening rush hours. It brought about many protests when started. In handing down the order the commission reserved the right to regulate the system. The plan was recommended by the Traffic Survey Commission.

The commission said that it fells that the limited stop plan is still in an experimental stage, that it may possibly be extended if traffic conditions make it necessary, or it may be abandoned if it does not effect a real saving of time or if some better means of speeding up traffic is devised. The commission said that it will carefully observe the results and no extension of the system will be permitted without its permission.

The opinion of the commission is that the skip-stop has been helpful in eliminating the difficulty caused by the bunching of cars in complying with the traffic light signals. The streets intended for the movement of traffic have, in the downtown section particularly, become little more than storage places for automobiles, the commission said, a narrow line in the center only being left open for moving traffic. It is pointed out that this has been an especial burden on the street-car rider because all moving traffic is forced on the car tracks. The commission says:

Modern methods of controlling automobile traffic, such as automatic signal lights, however desirable and necessary they may be for that purpose, have put an added burden of delay on the street cars. It may be highly desirable to move automobile traffic in fleets, but street cars are intended to run on schedules and bunching them in fleets with automobiles is destructive to schedules.

Passengers Help Select Seats

The Texas Electric Railway has asked its passengers to aid it in the selection of the most desirable type of seats for its passenger cars. An interurban car in service between Dallas and Waco has been equipped with several types of the most modern seats offered by leading manufacturers and passengers have shown much interest in expressing their preferences. Several thousand votes have been deposited with conductors by passengers who filled in the forms provided for this purpose. In several instances more than a formal vote was cast, important suggestions being offered for the improvement of passenger comfort in the cars.

When a decision has been reached as to the most desirable type of seat the company will change the seating in its cars to this type. In the reseating of its cars a decided innovation will be the rearrangement of seats so that they will be a greater distance apart than at present. They will be relocated without regard to windows.

James P. Griffin, vice-president and general manager of the Texas Electric Railway, conceived the plan of allowing passengers to express their seat preference and several seat manufacturers have co-operated by furnishing sample seats for equipping the car.

Ten Cents in Erie

The railway fare in Erie, Pa., will be advanced from 8 cents to 10 cents with tickets at the rate of six for 50 cents on Aug. 15. A new tariff providing for such change has been filed by the Erie Railway with the Public Service Commission. A statement issued by A. R. Myers, president, declared high operating costs and competition with automobiles were factors that made the increase in fares necessary.

Cars Burned As Junk

Twelve street cars of the Key System Transit Company, Oakland, Cal., which had outlived their usefulness made good fuel for a large fire recently. The bodies were lifted from the trucks with a derrick and thrown into a pile, whereupon a match was lighted and $120,000 of old equipment went up in flames. The old cars had been replaced by new steel ones. A year ago the company burned a similar batch of cars considered too antiquated.

Corporation Counsel Presents New Omaha Franchise Draft

The tentative draft of a new franchise for the Omaha & Council Bluffs Street Railway, Omaha, Neb., has been presented by Corporation Counsel Van Dusen for the city. He says that it differs in many respects from the franchise that was defeated by the voters and from other drafts, with provisions intended to protest the city against such claims as are now being made by the Guaranty Trust Company in the interest of the bondholders. The draft is intended to form a working basis for negotiations. Mr. VanDusen says that the law giving the city power to draft and submit its own franchise is ambiguous and vague and he thinks it might be necessary to get a Supreme Court decision to fix the full extent of the city's powers.

Mr. Van Dusen says that his draft does not touch on any of these matters: Electrolysis, free fare for policemen, firemen and letter carriers, sale of electric power, freight service, restrictions on single or double tracks, removal of snow and ice, sprinkling streets and other matters. He does give the company the right to operate buses, a new thing in similar franchises. No mention is made of the bridge across the river owned by a subsidiary company.

The right is reserved to the city to order extensions and to regulate car stops. The draft seeks to restrict any subsequent legislation enlarging the company's powers unless the people affirm the changes by vote.

Some of the terms of the new grant are said not to be acceptable to the company since they would render adequate service difficult if not impossible and make it extremely unlikely that the refinancing could be accomplished that must be done by next January.

President Hamilton says the draft is valuable only in that it forms the basis of discussion and negotiation with the Council. He continues in a statement made public:

The primary object of each party is to provide for public transportation. This makes it very important that the governing authority shall have in mind the best interests of the public as a whole. It is equally important that the company shall have in mind that the real purpose of its business is the transportation of the public.

Our examination leads us to conclude that in some of the sections are found provisions that render adequate operation difficult, if not impossible. There are also provisions which would make it extremely difficult to refinance the funded debt and obtain the additional capital required from time to time to keep pace with the growth of the city.

We hope to negotiate with the city in open meeting and present our opinions respecting the changes that are necessary. Courtesy requires that we shall meet with the City Council and discuss the various provisions rather than present any specific views first through the public press.

Various neighborhood civic improvement clubs have announced debates and discussions on the franchise as proposed.

Recent Bus Developments

Service Between Springfield and Chicopee

Bus service between Springfield and Market Square, Chicopee, was started on July 24 by the Springfield Street Railway, Springfield, Mass., and on the following day the process of removing the company's tracks between the Springfield city line and Market Square, Chicopee, was begun. The new Chicopee service takes the place of the car service long maintained by way of Glenwood and is a continuation of the bus line previously running through Armory Street, Springfield, to Hamburg Street, at the city line. Three new buses were put into service with this extension.

Would Make Bus Service Permanent

The Spokane, Portland & Seattle Railway has filed with the city auditor of Portland, Ore., an appeal asking that the temporary franchise substituting bus service for railway service in the Kings Heights district be made permanent. The temporary service has been in use for about three months and the company states that it is convinced the public favors the automobile service, and that therefore it should be made permanent.

Another Bus Substitution in Connecticut

The Connecticut Company, Bridgeport, Conn., has abandoned railway service over a 6-mile stretch between Pecks Mills and Derby, Conn. Bus service will be substituted at once. The state is building a new highway between Stratford and Derby and the railway did not see fit to relay the tracks this improvement would necessitate. The plan was considered two years ago and permission obtained at that time from the Public Utilities Company to substitute bus service. Trolley service will be maintained between Bridgeport and Pecks Mills, Stratford. The Bridgeport-Derby line had been in operation since August, 1898.

Indianapolis Railway Will Appeal Case

The Indianapolis Street Railway, Indiaiapolis, Ind., will appeal to the Marion County Circuit Court the decision of the Public Service Commission, which on June 10 denied a second time the petition of the company to purchase the stock of the Peoples Motor Coach Company for $500,000. Utilities in Indiana have the right to appeal from the commission to the Circuit Court under a new law of this year.

The petition was refused at the first hearing on the grounds that the price proposed was in excess of the actual value of the property of the bus company and that the railway in its present financial condition would be unable to stand the financial strain resulting from the purchase. The commission upheld its original decision at the rehearing. The railway will now appeal to the Circuit Court.

Temporary Victory for Muncie, Ind., Bus Operators

Bus operators at Muncie, Ind., scored a temporary victory recently when the Indiana Supreme Court announced a ruling that a return made by attorneys for the Union Traction Company of Indiana to a writ of prohibition filed by the bus operators was insufficient. The railway last fall obtained an order from the Circuit Court at Anderson enjoining the Muncie bus operators from driving in competition with the railway. The bus operators refused to comply with the order and the company sought to have them held in contempt of court. That was the beginning of the action in the Supreme Court which seeks to prohibit the Madison County Court from punishing the operators for contempt.

The final chapter in the matter, however, still remains to be written, for the case has been taken to the United States District Court in Indianapolis by the Equitable Trust Company, New York. That company seeks to enjoin the buses so as to prevent injury to bonds secured by mortgages on property of the Union Traction Company, of which the plaintiff is trustee. The petition also asks that the defendants be required to obtain proper certificates. The suit explains that a decision in the Circuit Court at Anderson, Ind., was set aside by the Indiana Supreme Court, which ruled that the Madison court had no jurisdiction.

Municipal Bus Project in Buffalo Collapses

Another attempt by Mayor Frank X. Schwab of Buffalo, N. Y., to establish municipal bus service has collapsed and the 3-cent line in the Kensington district will be discontinued on Aug. 1. Mayor Schwab says patronage was not sufficient to justify the continued expenditure of public funds for the maintenance of the service. The amount of the deficit was not reported by the Mayor to the City Council, but it was said by the Mayor to be several thousand dollars. City operation of bus lines has been held illegal by the courts, but the Mayor started the service some months ago declaring a transportation emergency existed in the Kensington district of the city. Application of the International Bus Corporation, a subsidiary of the International Railway, for permission to operate a bus line in the Kensington section was rejected by the municipal authorities.

More Routes in Westchester

With the institution in Mamaroneck and Larchmont of an interweaving bus system by the County Transportation Company, these communities were linked on July 24 by motor coach lines with their railway stations and with Rye Beach. The new bus lines have their western terminus at the old Larchmont Manor electric railway terminal. The Manor trolley line was abandoned when the motor coaches went into service. The Manor buses now run on Larchmont Avenue to the station of the New York, Westchester & Boston Railway. Here connection is made with the Larchmont-Mamaroneck bus line and with the Larchmont-Rye Beach line. Free transfers are issued to cars of the New York & Standard Railway. The route of the Larchmont-Rye Beach line is from the Larchmont station of the Westchester & Boston Railway to the beach.

Napa Valley Route Approved

Denying the petition of the California Transit Company for a rehearing of its formerly denied petition for a permit to operate a line of stages between Vallejo and Calistoga, the Railroad Commission recently removed the last obstacle of the San Francisco, Napa & Calistoga Railway to operate a line of buses over the same route in connection with its train service.

The stage subsidiary will be known as the Napa Valley Bus Company. Instead of a train, a bus will meet the last San Francisco boat at Vallejo and run through to Calistoga. Buses will not be run when the travel justifies the operation of trains.

Municipal Line Suggested for Los Angeles

Asking that the city establish a municipal bus line between some central point in Los Angeles and the beach city of Venice, now included in the corporate limits of the city of Los Angeles, a petition containing more than 30,000 names was filed with the city clerk of Los Angeles on July 21. The petition was referred to the Public Utilities and Transportation Commission and the public utilities committee of the City Council. An early report and recommendation was urged. The petition asked that the municipal bus line run on Venice Boulevard and that the funds for its establishment be appropriated from the general fund of the city, that one-way fares be 15 cents, round trip 25 cents, that commutation books be issued and that the line be operated by the city. At the present time transportation at the beach cities is furnished by the Pacific Electric Railway.

Financial and Corporate

Committee Charges Partisanship in Chicago Receivership

A petition seeking the removal of one or more of the three receivers of the Chicago Railways was filed on July 14 with Federal Judge James H. Wilkinson by a protective committee of owners of the railroad's stock certificates.

The petition charges that some of the receivers are in a conspiracy with Samuel Insull, chairman of the Chicago Rapid Transit Company, and certain Chicago banks holding the bonds of the company to "freeze out" holders of the series I certificates. The three receivers appointed last December by Judge Wilkerson are Henry A. Blair, president of the Chicago Surface Lines; John J. Mitchell, chairman of the Illinois Merchants Trust Company, and Frederick H. Rawson, president of the Union Trust Company.

It is alleged in the committee's petition that the equity of the original stockholders of the company is about to be injured by a scheme entered into by Messrs. Blair and Insull and the various trust companies holding the mortgages of the company to foreclose on one or more of the mortgages against the company's properties. When this has been accomplished, the committee charges, a reorganization plan is contemplated from which original stockholders are to be excluded. The petition further contends that the removal of one or more of the receivers should be considered an emergency matter and acted upon immediately.

The certificate holders' protective committee has been endeavoring for some time to secure court recognition of its claims to the right to be represented in the negotiations for the settlement of the local railway problem.

Objections to the filing of the petition were made by attorneys for the Surface Lines and the Harris Trust and Savings Bank, one of the trustees. They suggested that permission to file the petition be withheld until next fall, when arguments might be heard.

Riding and Earnings of Chicago Surface Lines Decrease

After a record of 24 consecutive months in which gains were made in passenger traffic over the corresponding month of the preceding year, the Chicago Surface Lines reported on July 20 a moderate decrease in both passengers carried and total revenue for June as compared with the similar month of 1926. There were 131,583,475 riders last month, as against 131,980,301 in June of last year.

Divisible receipts for the period were $417,814, compared with $446,005 in the similar month a year ago. Gross earnings from all sources for the month were $5,122,007, against $5,135,965 in June, 1926. It is pointed out, however, that the lines carried considerably more than the normal June traffic last year, due to the Eucharistic Congress. No similar factors entered into the June figures this year.

Judgment Creditor Proceeds Against New York Interurban

Application will be made within the next few weeks to County Judge Thomas H. Noonan in Buffalo by the Olean, Bradford & Salamanca Railway, Olean, N. Y., for permission to abandon its interurban lines and scrap its equipment. Former Judge Frederick W. Kruse, Olean, who has been serving as receiver for the company's properties since Aug. 30, 1926, is seeking authority to abandon the line. The Forbes Motor Agency, Olean, has a judgment against the railway and has obtained a court order directing the company to show cause why its equipment should not be scrapped. Opposition to the abandonment of the interurban has developed in the communities served by the line.

Simplification of London Underground Financial Structure

Holders of 6 per cent income bonds of the Underground Electric Railways, London, Ltd., will meet in London on Aug. 5 to approve a plan which would make interest on the bonds subject to British income taxes instead of being tax-free as at present; make the bonds irredeemable until June 30, 1929; redeemable at 103 from that date to June 30, 1937, and thereafter at par, instead of being as at present redeemable at par on six months notice, and give holders of the bonds the right until June 30, 1929, to convert their bonds into £1 ordinary shares at £1 2 shillings a share. The plan also provides for the issuance of more 4½ per cent bonds of 1933, or other securities ranking in priority to the income bonds on condition that further collateral be pledged as security. It is also provided that as income bonds are converted or redeemed a suitable proportion of securities pledged as collateral shall be released.

The share capital of the company is to be increased by the creation of not less than 5,800,000 new £1 ordinary shares and the necessary amount of such ordinary shares to meet the conversion rights of the income bondholders to be retained unissued until after June 30, 1929.

The plan is described as a step toward placing the company's capital on a wider and simpler basis and substituting other securities, at a lower annual cost to the company, for those outstanding.

To Proceed with St. Louis Purchase

Following the announcement by Mayor Miller of St. Louis, Mo., that he will not sponsor a new railway franchise at this time, the St. Louis Public Service Company stated that it will go through with its plans for the purchase of the properties of the United Railways at foreclosure proceedings. The new company may operate under the old franchise, which has at least twelve years to run, or obtain a new grant from the Board of Aldermen or by direct vote of the people.

Articles of incorporation were filed on July 20 for a new company, known as the City Suburban Public Service Company, as a subsidiary of the St. Louis Public Service Company. It is intended merely to be part of the machinery necessary to complete the reorganization of the railway with reference to suburban lines. Another subsidiary, the St. Louis Bus Company, was formed many months ago to meet the steadily growing competition of the People's Motorbus Company.

The United Railways in the quarter ended June 30 carried 62,761,114 passengers, compared with 64,972,511 for the corresponding period in 1926. In the quarter ended March 31 the company carried 63,371,709 passengers.

The Public Service Commission on July 23 overruled the motion filed by the United Railways for a modification of the commission's order of June 25, which fixed the tentative rate-base valuation of the company's properties at $52,024,000 as of Dec. 31, 1926. The order of June 25 granted the company a temporary increase in fares of 8 cents or two tokens for 15 cents compared with the old rate of 7 cents straight for adults.

The company had filed a motion accepting the temporary fare, but asked the commission to modify its findings concerning the tentative valuation, return and certain deductions in depreciation. The railway sought a tentative valuation of not less than $75,000,000 and also sought to be credited with $6,183,009 accrued in the company's depreciation reserve fund as part of its valuation.

Neither the order of June 25 nor the subsequent action on July 23 affects the rate and valuation case now pending before the commission.

Protective Committee for Northern Indiana Holders

As result of appointment of a receiver for the Chicago, South Bend & Northern Indiana Railway on July 9, a protective committee has been formed to represent bondholders in the consideration of any readjustment plan. The issues which the committee will represent are the first mortgage 5 per cent 30-year bonds, due 1937, of the Chicago, South Bend & Northern Indiana Railway; La Porte & Michigan City Traction Company 5 per cent 25-year first

Digitized by Google

mortgage bonds, due 1930, and Northern Indiana Railway first consolidated mortgage 5 per cent, due 1935. Charles F. Dieterich is chairman of the committee, which comprises A. L. Kitselman, A. Gordon Murdock and Amos H. Plumb. Sherman Allen of New York City, will act as secretary for the committee and Shearman & Sterling will act as counsel.

Omaha Earnings Better

The Omaha & Council Bluffs Street Railway, Omaha, Neb., in its June report, made to the Nebraska State Railway Commission, shows transportation revenues of $230,636, for June, 1927, compared with $243,350 for June, 1926, but a $21,000 reduction in operating expense and a $3,000 cut in taxes. These reductions enabled the company to show a surplus after interest and taxes of $987, whereas for June, 1926, the company went into the red $8,956. Gross revenues in June, 1927, were $235,630, operating expenses $167,829, taxes $27,212 and income after taxes and before interest and miscellaneous payments $39,178. Interest was $37,479 and total deductions $38,191.

Philadelphia Figures for Six Months

The income account and passenger statistics of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for the first six months of the present year are as follows:

INCOME ACCOUNT OF THE PHILADELPHIA RAPID TRANSIT

	Six Months Ended June 30, 1927	Three Months Ended June 30, 1927
Operating revenue	$29,108,089	$14,618,250
Operation and taxes	22,304,401	11,227,439
Operating income	$6,803,688	$3,390,811
Non-operating income	451,889	242,044
	$7,255,577	$3,632,855
Payments to city: sinking fund and Frankford elevated	480,099	240,049
	$6,775,477	$3,392,806
Fixed charges and dividends	6,745,631	3,378,463
Surplus	$29,846	$14,342

PASSENGER STATISTICS

	—Six Months Ended June 30, 1927— Passenger Revenue	Passengers Carried	Average Rate per Passenger, Cents
Surface subway and elevated	$24,288,916	461,433,811	5.25
Motor bus	1,469,951	16,024,530	9.17
	$25,698,867	477,458,341	5.38
Taxi	2,980,674		
Total	$28,679,531		

	—Six Months Ended June 30, 1926— Passenger Revenue	Passengers Carried	Average Rate per Passenger, Cents
Surface subway and elevated	$25,011,821	469,916,443	5.32
Motor bus	1,269,292	13,655,498	9.30
	$26,281,114	483,571,941	5.43

Default Ahead for Puget Sound Electric Railway

The Puget Sound Electric Railway, which is controlled by the Puget Sound Power & Light Company, is notifying holders of its $2,427,000 outstanding first consolidated mortgage 5 per cent gold bonds that it will be compelled to default the next interest coupon, due on Aug. 1.

The Puget Sound Power & Light Company, acquired the capital stock of the Puget Sound Electric Railway in 1912. It has never received any dividends on these holdings, and the only return which it has received on its entire investment in Puget Sound Electric Railway consists of interest payments aggregating $153,849. Up to the present the power company has advanced the moneys necessary to meet the financial requirements for construction and renewals, bond sinking funds, maturing debts, and deficits in income of Puget Sound Electric Railway System in the hope that the unfavorable conditions might ultimately be improved. The directors now feel the present situation and the future prospects of these properties are so unfavorable that they are no longer justified in making further advances to assist in financing that company.

The Puget Sound Electric Railway has outstanding in the hands of the public, $2,427,000 first consolidated mortgage 5 per cent gold bonds, due Feb. 1, 1932. It also has outstanding the following securities owned by the Puget Sound Power & Light Company: $4,895,000 of income bonds; $1,116,700 preferred stock and $2,000,000 common stock. In addition, it owes the Puget Sound Power & Light Company for advances on open account $1,188,510 up to June 30, 1927.

Operation of the interurban railway between Seattle and Tacoma has from its inception been conducted in competition with a boat line. With the advent of the private automobile, earnings of the interurban railway have shown a persistent and steady decline except for a period during the war when travel was stimulated by traffic from Camp Lewis, and by extensive operation of shipyards and other war time activities. Since 1919 the business has resumed its decline, and during the four years since 1922 the company has failed to earn its total mortgage bond interest charges.

The State now has under construction a paved highway between Seattle and Tacoma, which will make available for private automobile and stage operation a route some 3½ miles shorter than the route of the Puget Sound Electric Railway. When this road is completed it seems inevitable that operation of the interurban will become even more unprofitable.

Tacoma Railway & Power Company and Pacific Traction Company have likewise suffered from automobile competition until their earnings have fallen to such a point that in 1926 the Tacoma Railway & Power Company failed to earn its bond interest charges, and the Pacific Traction Company failed to earn its operating expenses and taxes. These facts have been set forth openly without any thought of minimizing the consequences of their disclosure.

W., B. & A. Cuts Loss for Six Months

A net loss of $60,331 is reported by the Washington, Baltimore & Annapolis Railway, Baltimore, Md., for the six months ended June 30, compared with a net loss of $62,478 in the similar period last year. These earnings include only the operating results of the electric railway. The comparative statement for the six months follows:

Six Months to June 30	1927	1926
Railway operating revenues	$995,516	$984,068
Railway operating expenses	818,221	808,255
Net revenue railway operations	$177,294	$175,812
Net revenue auxiliary operations	51,364	45,314
Net operating revenue	$228,659	$221,127
Taxes assignable to railway operations	47,127	47,710
Operating income	$181,532	$173,417
Non-operating income	16,027	17,490
Gross income	$197,559	$190,907
Deductions from gross income	257,890	253,385
Net loss	$ 60,331	$ 62,478
Percentage railway operating expenses to railway operating revenues	81.18	81.13

*Deficit.

Must Remove Tracks

The Public Service Commission granted on June 1 the petition of the town of Waterloo, N. Y., and issued an order to the Geneva, Seneca Falls & Auburn Railroad, Inc., and James M. Ryan and Lansing G. Hoskins, as receivers, to remove its tracks from the south side of the highway on the north side of the river leading from Waterloo, westerly to Geneva, to the center of the new highway for about 150 ft. west of the village line, and to the north side of the highway from that point for about 1,200 ft. The cost of this work is to be paid by the town of Waterloo and repaid by the railroad company as agreed upon.

Seattle Municipal Still a Storm Center

Members of the City Council of Seattle, Wash., are trying to determine from two sets of figures that are before them the financial status of the Municipal Railway Department. From one set, that of D. W. Henderson, superintendent, it appears the railway is "doing fine" despite large expenditures. From the other set, that of City Comptroller Harry W. Carroll, the railway is still a losing proposition.

According to Mr. Henderson, gross revenues for the first six months of 1927 totaled $2,848,920, with operating expenses at $2,734,100, leaving a net income of $114,820. Moreover, Mr. Henderson's tabulation showed a gain in patronage. For the first half of the

Digitized by Google

present year the railway carried 45,018,318 passengers, while during the first six months of 1927 the number of passengers carried was 44,987,660. According to Superintendent Henderson, the first six months of 1927 showed a net operating revenue of more than $170,000, compared with a net operating loss of $54,000 shown on the books for the first six months of 1926.

Comptroller Carroll's figures for the railway this year showed it to be now $28,000 behind in operating revenue.

Councilman Oliver T. Erickson declares the Henderson report is misleading, in that the increased number of passengers carried in 1927 means that "more deadheads and transfer passengers were carried in 1927 than in 1926." Mr. Erickson declares that the figures from Mr. Henderson's books show for the first six months of 1926 a total of 34,917,372 pay passengers compared with 34,325,259 pay passengers for the first six months of 1927, an actual loss in pay passengers. He said that the average loss in business a day since fares were raised in 1921 has been 3,137 passenger fares.

In replying to Mr. Erickson's statements, Mr. Henderson said that the increase as listed was largely in transfer passengers. He declared that the city has more buses on than before and that means more transfers.

Mayor Bertha K. Landes declares that notwithstanding a loss in pay passengers, there has been a reduction in operating expenses and a general improvement in operating methods that places the railway in a better condition than heretofore.

Common Dividend of Duluth Company Attracts Attention

According to the *Canadian Financial Post* investors in utilities are turning their attention to Duluth-Superior Traction Company, Duluth, Minn., owing to the marked improvement in the earnings position of the company for the first four months of this year, compared with the corresponding months last year. Attention was drawn to the common stock of the company by the declaration of a $1 dividend recently, and the announced intention of the directorate to maintain the stock on a $2 basis. The *Post* said:

> The board of Duluth-Superior, headed by A. E. Ames, Toronto, is conservative in the matter of dividends and it is deemed improbable that any dividend would have been declared on the common unless there was reasonable hope of continuance.

The dividend record of the common stock of Duluth-Superior has been unsatisfactory since the early stages of the world war. The normal rate of 4 per cent was reduced to 2 per cent on Jan. 2, 1915, and the payments were discontinued in July of the same year. One per cent was paid Oct. 1, 1917, Jan. 2, April 1, July 1, Oct. 1, 1918. A further 1 per cent was paid in December, 1924, but none has been paid in the last three years.

Personal Items

J. K. Buchanan Manager at Morgantown

Announcement has been made by the Monongahela West Penn Public Service Company that J. K. Buchanan, Morgantown, has been appointed general manager of the Morgantown division of the company. The West Penn only recently acquired the property at Morgantown from the West Virginia Utilities Company. It will supply the city with all its electric power and operate the local railway lines.

Mr. Buchanan succeeds R. P. Stacy, who was vice-president and general manager of the West Virginia Utilities Company. Mr. Buchanan was originally in charge of the utilities properties at Morgantown until a change of ownership a few years ago, at which time Mr. Stacy was appointed in his stead.

V. A. Hupp Made Bus Superintendent at Fairmont

Vailey A. Hupp, Fairmont, W. Va., has been named general superintendent of the bus department of the Monongahela West Penn Public Service Company, which is operated under the name of the Monongahela Transport Company. Mr. Hupp succeeds H. C. Aument, resigned. The principal bus lines of the Monongahela Transport Company extend from Fairmont to Morgantown, Fairmont to Benton's Ferry, Morgantown to Mountain Lake Park and Morgantown to Star City. They also include the Morgantown city lines.

The new superintendent probably will be located at Morgantown. He has been car foreman at Fairmont and assistant superintendent of equipment of the Monongahela West Penn, having been with the company for a period of about five years. Previous to that time he was assistant car foreman for the Baltimore & Ohio Railroad.

Messrs. Lucas and Peterman Executives of Southern Company

John Paul Lucas of Charlotte, N. C., and R. L. Peterman of Columbia, S. C., have been made vice-presidents of the Southern Public Utilities Company, Charlotte. Mr. Lucas has been connected with the Duke interests for more than eight years, concentrating especially on public relations work. In 1922 he was temporarily released in order to devote his time to a "Live-at-Home" campaign then being conducted in North Carolina. The purpose of the movement was to bring before the farmers of the state the grievous effects of failure on their part to grow at home food needed by their families and livestock. So successfully did Mr. Lucas handle the publicity for the campaign that the joint committee for agricultural work passed a resolution thanking him for his efforts.

Mr. Peterman has been connected with the General Gas & Electric Corporation and its subsidiary companies for the past twelve years. He was located at Greensboro as vice-president of the North Carolina Public Service Company, then at Spartanburg, S. C., with the South Carolina Gas & Electric Company, and at present at Columbia, S. C., where he has been connected with the Broad River Power Company.

A. J. Lundberg Succeeds L. S. Ready on Key System

Lester S. Ready has resigned as president of the Key System Transit Company, Oakland, Cal., and has been succeeded by Alfred J. Lundberg. Mr. Ready will remain with the company as vice-chairman of the board of directors.

This change in management is the latest step in the control of operation of the Key System by the San Francisco investment firm of J. Barth & Company, in which Mr. Lundberg is a partner. The new president said the move was made to keep the railway out of the hands of a receiver. On taking up the duties of his new office Mr. Lundberg said:

> Our first interest is to restore the company's credit and get its securities on a sound basis. After that has been done, we plan an extensive expansion program, which is to include an automobile ferry service from our pier.
>
> The strictest economies will be necessary at present to keep the company from going into the hands of a receiver, but with the restoration of credit, improvements in service and an active campaign for new business are planned. The company's physical assets have an actual value of $30,000,000, while the outstanding Key System securities do not exceed that amount. The company should be sound financially. It is our business to make it so and I am positive that we can do that.
>
> We realize that we must offer modern and comfortable transportation if we are to prosper. Public transportation, I believe, is at its lowest ebb at present. It is bound to improve steadily as the parking problem becomes more acute.
>
> The private automobile is our greatest competition, and in going after new business we expect to provide transportation in cleaner and more comfortable cars at a speed not so far behind the automobile. That all takes time and money and to get money we must first better the company's financial position and restore its credit.

Mr. Lundberg does not believe that there will be any further increase in fares from the present 7-cent rate, which has been in effect since 1926. The 1-cent increase granted at that time by the Railroad Commission resulted in a loss of business.

Digitized by Google

ous strip mill to produce sheets in strip form "stripsheets" up to 36 in. in width. They employ both a hot and a cold rolled process in their plan of manufacture.

"This amalgamation brings together under the banner of Armco," says Mr. Verity, "these two outstanding developments which cover the only known means of a purely mechanical operation in the manufacture of sheet metal, either in the form of sheets or strips. This gives Armco control of at least 1,000,000 tons per year of finished product of the highest grades with which to protect the needs of its clients. The Columbia Steel Company will, for a period as yet undetermined, be operated as a separate company, but the entire product will be sold by Armco."

Work Rushed on Twenty Cars for South Shore Line

The twenty new passenger cars being built for the South Shore Line by the Pullman Car & Manufacturing Corporation are being rushed to completion to aid in providing service for the heavy summer travel on the railroad. Ten of the new cars will be motor cars and ten will be used in multiple-unit operation as trailers. Delivery of the first of the new cars is expected late next month and the others will follow as rapidly as possible.

A new feature of the interior furnishings is the new "easy chair" type of seat which has been tried on two remodeled cars now in service. Mention of this rolling stock was made in the JOURNAL for March 5.

Hannibal Car Wheel Company to Build Plant in Louisiana

The Hannibal Car Wheel & Foundry Company, Hannibal, Mo., has awarded contracts to the Austin Company, 6112 Euclid Avenue, Cleveland, Ohio, for the erection of a modern car wheel and foundry plant in Southport, La. The building will include an office structure, two stories high, 38 ft. x 38 ft. and of brick and concrete construction; a steel foundry, 200x200 ft., and a steel machine shop, 43x104 ft.

Deadlock in Labor Conference on Coal Strike

Another chapter of the labor history of 1926 was written when the district conferences looking to the settlement of the coal strike broke up in deadlock.

The prospect of a general agreement for the central competitive field was recognized, long before April 1, as practically unobtainable. The announcement of the union, however, that it would consider the district agreements opened the way for these independent district conferences. Conferences now have been held that affect directly or indirectly most of the big fields. The story of the conferences is singularly the same. The operators indicate that they cannot pay the Jacksonville scale. The union leaders say they can consider nothing less and the conference adjourns. The attitude of the other districts practically is sealed by the results of the conferences that have been held. Contrary action by Indiana or the Southwest interstate district is not expected. It is regarded as significant, however, that the overtures at these conferences come from union leaders.

In the meantime nothing has occurred to indicate a change in the feeling of consumers. Prices are weak and the heavy output of eight and one-third million tons probably is not far from meeting current requirements.

With the close of this chapter of the story none seems to be able to imagine which way the plot will turn next. Barring something unexpected the industry seems to be settling into another period of waiting. It is apparent that neither side is ready as yet to meet the terms of its opponent. There appears no prospect for the early breaking of the deadlock, and even the "fading out" process predicted by some seems remote.

EXHIBITOGRAPHS—No. 1

A "COMEDY OF ERRORS" might well be applied to the artist's conception of these nemeses of A.E.R.A. exhibitors. Look to the left! Imagine the gentleman of military mien, "Cun'nel" Alexander, resting in any dugout when there are objectives uncaptured. Or that human dynamo, one "Freddie" Dell, ever squatting when there is still space to sell. Equally is the imagination stretched by the recumbent "Clint" Morgan, who when not making them sign the dotted line is flitting between Brooklyn and the Transit Commission's office.

Nearly all the prospects are vacationing. Yet

was the latest word on July 27 from A.E.R.A.'s H. Q.

They may have their eyes on the pill, that "ole swimmin' hole" or the whizzing reel, yet they haven't forgotten that

Cleveland Is the Place to Talk Turkey

Supplies Bids for Montreal Tramways Opened

Tenders received for the supply of electrical equipment embraced in the year's construction program of the Montreal Tramways were opened July 9 by the commissioners and referred to the general manager and secretary for examination and recommendation. Firms submitting tenders were: Canadian General Electric Company, Canadian Westinghouse Company, Northern Electric Company, English Electric Company of Canada, Monarch Electric Company, Ltd., and Haliburton & White, Ltd. The tenders cover about 50 pages of items, including a new electric yard locomotive.

Track Reconstruction Ordered by St. Louis Civic Authorities

The United Railways, St. Louis, Mo., has been ordered to relocate its tracks on Kingshighway from Barnes Hospital to Manchester Avenue preparatory to the reconstruction of the thoroughfare.

Digitized by Google

Between Barnes Hospital and Oakland Avenue the tracks will be placed in a parkway that now separates Kingshighway from a drive in Forest Park. From Oakland Avenue to Manchester Avenue Kingshighway will be widened 8 ft. on the west side and the tracks will be changed from their present position near the east curbing to the center of the widened street.

Every effort will be made to speed up this reconstruction work as Kingshighway is the main north and south thoroughfare in that vicinity and carries the heaviest automobile traffic at various periods of the day. The increase in automobile traffic during the past year forced the widening of the street and the relocation of the street car tracks.

Copper-Lead Price Still Advancing

The week ended July 27 witnessed further advances in prices for both copper and lead in the domestic markets. Copper is up ⅛ cent to 13 cents delivered in Connecticut, and the price for New York lead has advanced from 6.30 to 6.50 cents, with premiums over the price of the leading interest in evidence most of the week.

Buying has not been particularly heavy during the week, but without exception sellers are asking 13 cents, and one or two are out of the market at this level. A strong factor has been the active foreign buying. The price of the export association was advanced from 13 cents, c.i.f. on July 21 to 13.15 cents, and on Monday, July 25, a further advance to 13.25 was made. This was after the domestic market had been pretty well established at 13 cents in the valley. The effect was to dull the appetite of foreign buyers for the time being, but sales for the month of July will total close to 60,000 tons, or nearly as much as in the excellent month of May. The American Brass Company has made another advance in the prices of its products, this being the second within ten days. The basis is now a 13-cent copper market.

On July 21 and 22 and the following Monday lead sellers were swamped with inquiries. The man who asked for 1,000 tons had to be content with 100 or 200, and smaller inquiries were pared in proportion. The American Smelting & Refining Company, faced with premium business in the outside market, raised its official contract price for New York lead twice: from 6.30 cents to 6.40 cents on July 21 and to 6.50 cents on July 22. The leading interest in the West raised its price to regular customers to 6.30 cents on July 22 and since then has been willing to take attractive business at 6.325 cents. Fancy prices ranging up to 6.45 cents in St. Louis and to 6.70 cents in New York were obtained during the early part of the week.

Zinc prices have fluctuated within narrow limits, with the volume of business up to normal. Brass special grades have been particularly active, although the premium has usually been closer to 2½ points than to 5. The statistical position of the metal is improving.

Consumers in the domestic market showed little interest in tin last week. Prices for Straits are slightly easier than a week ago, and spot, prompt, August and September deliveries can be had at the same prices. Tin of 99 per cent grade is in a little better position than Straits. In London there is a backwardation of nearly £6 per ton.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	July 26, 1927
Copper, electrolytic, cents per lb	12.79

Turpentine (bbl. lots), N. Y., per gal	$0.62

† Quotations withdrawn on account of strike.

ROLLING STOCK

ALABAMA POWER COMPANY is planning to add two large new cars to the service on its railway system in Gadsden, Ala. They will be modern, low-bodied, low-wheeled, high-speed cars. They will be lighter than the cars now in use, but will have larger seating capacity and much higher speed.

WORCESTER CONSOLIDATED STREET RAILWAY, Worcester, Mass., has received five 29-passenger buses from the Fageol Bus Company of Detroit, estimated to cost $45,000.

INTERNATIONAL BUS CORPORATION, a subsidiary of the International Railway, Buffalo, has received ten gas-electric and fourteen gasoline motor buses for operation on its local bus lines. They are all of the single-deck type, equipped with pneumatic tires, with dual tires on the rear wheels. These buses are similar to those used by the company on the Delevan Avenue and the Kenmore-Tonawanda routes and they bring the total bus equipment of the International up to 85 vehicles, of which 49 are of the gas-electric type developed by Mitten Management, Inc., for service in Buffalo and Philadelphia.

TRACK AND LINE

WORCESTER CONSOLIDATED STREET RAILWAY, Worcester, Mass., has begun laying new rails in June Street from Newton Square to the end of the line. In order to avoid an interruption of traffic a bus is giving service from Newton Square to the terminus, transferring at the square. Reconstruction work involving an expenditure of $21,000 is also under way on the company's other lines. Work has been started on the Barbers Crossing line, where 700 ft. of new track is being laid on Burncoat Street. A motor coach is transporting passengers over the areas under construction. Extensive improvements are also under way on the Providence Street line, where 3,300 ft. of new track is to be laid. Motor coaches are also giving service at this point.

SOUTHERN INDIANA GAS & ELECTRIC COMPANY, Evansville, Ind., plans to spend $575,000 on railway service and in other departments during the present year. New tracks already have been laid on West Franklin Street and Barker Avenue and the Bellemeade Avenue line is now being double-tracked at a cost of more than $40,000. New tracks are to be laid on other streets as they are improved by the city.

TRADE NOTES

RAILWAY UTILITY COMPANY, Chicago, Ill., has moved to larger quarters at 2241-47 Indiana Avenue.

WALTER JACKSON, bus and fare consultant, has moved his Mount Vernon, N. Y., headquarters from 143 Crary Avenue to 160 Gramatan Avenue.

NATIONAL MACHINERY COMPANY, Tiffin, Ohio, and the Chambersburg Engineering Company, Chambersburg, Pa., announce a combination of their sales forces. Sales offices will be maintained in Tiffin, Chambersburg, New York City, Chicago and Detroit.

J. G. BRILL COMPANY announces that William M. Horsell, sales representative in the central states covered by the G. C. Kuhlman Car Company, has been transferred to its Philadelphia plant to represent the company's electric railway division in the Southeastern territory, including the states of Virginia, North Carolina, South Carolina, Georgia and Florida. Mr. Horsell has been with the Brill organization in its Kuhlman plant since 1920.

ADVERTISING LITERATURE

R. H. BEAUMONT COMPANY, Philadelphia, Pa., has prepared catalog No. 95 on the Beaumont cable drag scraper.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has distributed an interesting booklet on automatic generator voltage regulators.

OHIO BRASS COMPANY, Mansfield, Ohio, has mailed a circular describing its modern trolley base.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., has sent out looseleaf bulletins Nos. 149 and 150, describing two types of repulsion induction motors.

GOODELL-PRATT COMPANY, Greenfield, Mass., has recently distributed a catalog covering its electric drills. It is the company's first catalog.

Purchase of Power Again Indorsed

SIGNIFICANT, indeed, was the signing last week of a twenty-year contract between the Pennsylvania Railroad and the Philadelphia Electric Company whereby the latter will furnish energy for all of the railroad's present and future electrification projects in that district. The advantages and economies of buying energy for electrified railroads have been emphasized frequently by the light and power utilities. The railroads, however, have been cautious in following this advice. They have felt that it placed their motive power outside their own control, and in general they have preferred to remain wholly self-contained. Naturally this feeling has been more marked in the trunk line railroads than in the local electric railways. Many of the latter are closely affiliated with the light and power companies and they have not hesitated to depend on purchased energy. Indications are that the tide is now turning also in the trunk line railroad field. Electrification of the Illinois Central in Chicago was based on purchased energy. The influence of the action of a conservative railroad like the Pennsylvania in making a long-term contract for the purchase of energy will be felt strongly. These evidences that the railroads are looking with more favor on the policy long urged by the light and power utilities should spur the latter to give their best service and lend all possible encouragement to electrification projects.

Key System Officials Have Right Attitude

AFFAIRS have not been going well with the Key System Transit Company, Oakland, Cal. It is apparent that the increase in rates put into effect some time ago more than offsets the reduction in the use of transportation, but it failed to result in the increase in revenue estimated at the time of the hearing before the Railroad Commission. During the year the increase in wages under the labor award made effective Jan. 1, 1926, was $400,000. New work completed for the three years cost $2,566,752. In addition $4,335,870 of work remained uncompleted at the end of 1926, making the total net addition for the three years $6,380,276. During 1926 forty one-man, two-man cars were purchased and put into service. The detailed statistics of operation afford an interesting commentary on the affairs of the company.

Officials have been very frank in putting their cards on the table. Their announced intention is first to restore the company's credit and get its securities on a sound basis. After that has been done the management plans an extensive expansion program which is to include an automobile ferry service from its pier. It is going after new business, and in doing that it expects to provide service at a speed not far behind the automobile. The problem before the company is certainly a serious one, but the territory in which the railway operates is growing rapidly, the relations of the company with the public have been improved immensely and a management is in the saddle that appears to sense adequately the magnitude of the problem that is before it, but does not quail before that problem. Nothing would be gained at this time by calling the attention of the industry to the matter, if it were not for the fact that the disposition of the management carries its own message of confidence on the part of the present owners in their own property and in the essentiality of electric railway and bus service to the wellbeing of the communities which the system serves.

Southern Association Attracting Wide Attention

MORE than passing interest attaches to the large attendance and the wide representation at the recent meeting in Atlanta of the Electric Railway Association of Equipment Men, Southern Properties, a report of which is published elsewhere in this issue. Both maintenance men and operating executives were attracted from many properties outside the Southern territory. At the meeting they expressed themselves as heartily in accord with the work being done and signified their desire to co-operate and participate in this work.

What, then, is this active association doing which should be given attention by the rest of the industry? In the first place this is a working association; that is to say, the idea in the minds of its organizers was to arrange a medium through which equipment maintenance men might get together periodically for a comparison of their experiences and practices. The manufacturer is welcomed, but it is the general understanding that he may hear his product frankly criticised in "open meeting." To be sure, such criticism may be unfair. The conditions under which the product was used may have been entirely unsuitable, or the operator may have been hasty in his condemnation without knowing all the facts. Nevertheless, it is the object of this association to encourage the voicing of experiences and opinions fully and frankly. Therein lies one of its greatest sources of value. Each man is free to take the others' opinions for what they are worth. Only when the discussion is frank and open is the desired result obtained.

There is another phase of this association's work that is worthy of particular attention. That is the interchange of records of pull-ins and maintenance costs between the member properties. There is much less working in the dark than formerly. Figures that were at one time closely and jealously guarded are now openly interchanged and published. The result has been good for all concerned. The records have consistently improved and the costs have decreased. The effect on each participating property has been to stimulate a spirit of friendly rivalry which has brought about improvement in performance and at the same time has brought the work of the maintenance departments to the attention of the operating executives.

The results accomplished have attracted the attention

Digitized by Google

of properties outside the confines of the Southern territory in which this association was originally organized. New members have come in to participate in the good work which is being carried on. There is some danger that the rapid growth in membership may curtail in some respects the informality and free expression of opinion which has given to these meetings one of their greatest sources of value. But there is no question that the good work being done should be extended to other territories. One method would be to apply the idea of interchange of records as one of the phases of every sectional association's activity. A similar plan might also be profitably applied by the maintenance of way and distribution departments.

How Much Longer Can New York Afford to Pay the Price?

ANOTHER step has been taken in the establishment of the much discussed and debated New York bus service by the award of franchises by the Board of Estimate to the Equitable Coach Company for operations in Manhattan, Queens and Brooklyn to the Surface Transportation Corporation, a subsidiary of the Third Avenue Railway, for operation in the Bronx and to the Tompkins Bus Company for operation in the Borough of Richmond on Staten Island. This latter operation has already been started as an emergency measure due to the discontinuance of service by the municipal trolleys on the island when power was cut off the lines for non-payment of bills.

Just why the awards of franchises have been made in the manner finally decided upon is, of course, a complicated matter and one of expediency in which all the cross currents and motives are difficult to trace clearly. This applies particularly in the case of the Manhattan and Brooklyn franchises, for which the Fifth Avenue Coach Company and the Coney Island & Gravesend Bus Corporation, fostered by the Brooklyn City Railroad and the Brooklyn-Manhattan Transit Corporation, respectively, were active contenders. The former had gone to the extent of purchasing the New York Railways in order to remove from the field as a contender or objector an existing transportation company to which the proposed lines would in many instances be a competitor.

There is ample evidence that the much discussed bus question in New York is still far from being finally settled. In the first place certificates of convenience and necessity must be issued before the right to operate the proposed lines is fully confirmed. But in addition to that there looms the likelihood of court action by existing transportation companies to keep the Equitable out of Manhattan and Brooklyn.

It is quite evident that New York has again taken a step away from unification of its transportation facilities rather than toward that end. It is also quite evident that, regardless of who the final operators are, bus service in New York will be limited to the kind of service that can be rendered for a 5-cent fare. Of course this is not the 5-cent fare of which the politicians have made so much capital. The name is retained, but that is all. Five cents is the unit of fare, but there is no more similarity between what can be purchased for this 5 cents in the way of a bus ride and the universal city-wide transportation service that is given for 7 cents on the street cars of a city like Chicago, for example, than there is between a ticket to a side show and an admission to the "big top" of a circus. Furthermore, New York is committed to the kind of bus service that can be operated for 5 cents, just as it is committed to the kind of surface car service and rapid transit service that can be rendered for that rate of fare. New York insists upon having "cheap" transportation. It is a source of considerable interest to speculate on the question of just how long the American metropolis can afford to pay the price in inconvenience and discomfort.

The Double-Deck Car Again

IN LAST week's issue of the ELECTRIC RAILWAY JOURNAL a British engineer pointed out that double-deck cars are used almost exclusively in his country and urges their employment in the United States. This is done despite the fact that at one time double-deck cars were quite common on the continent of Europe, but have since been abandoned, leaving Great Britain and its South African colonies as their only present users. He says that the principal argument brought against them in the United States is that they are likely to be slower in operation, but he thinks this is erroneous. The average speed of double-deck cars in Great Britain, he says, compares favorably with that of single-deck cars in the United States and in continental Europe. He cites the speed of the London County Council cars to this effect. He then points out some undeniable advantages in double-deck cars, such as economy of street space occupied and of car weight per passenger seat.

But there are several reasons favoring the use of double-deck cars in Great Britain which do not apply in the United States. In the first place the Englishman is very fond of his pipe, and as smoking is permitted on the upper deck it is a popular place with smokers. Because of this smoking rule the windows on the upper deck (when inclosed) are generally kept open. This is no hardship in Great Britain even in winter, because the winters are mild. To make an upper deck comfortable in winter in most American cities north of the Mason-Dixon line would require that it be heated and the windows generally kept closed. Some British cars are operated without an inclosure for the upper deck. Such construction, of course, would hardly be practicable in America.

While the average schedule speed mentioned in the article for London (9.6 m.p.h.) compares favorably with average city speeds in America, there are certain reasons for the good record of the London cars. One is that no platform doors are used. Fares are collected while cars are moving. Stopping time is shortened due to passengers getting on and off cars while they are in motion. The location of stops for the London County Council conditions is given as 240 yd. apart, or $7\frac{1}{3}$ to the mile. There is some question, however, as to whether the actual stops for the interchange of passengers are not considerably below this, and consequently below the requirements in those American cities with which the author makes schedule speed comparisons.

There is a serious need for specific data regarding the stopping time of double-deck vehicles, both cars and buses. Unfortunately, in all discussions of the double-deck vehicle there is a notable lack of definite information regarding the actual loading and unloading time per passenger and the actual number of stops made for a given schedule. Without such data most discussions of this kind degenerate into a mere exchange of opinion, rather than an analysis of facts.

Digitized by Google

But slowness is not the only objection to the double-decker. American operators fear the possibility of accidents on the stairs, particularly with the high rates of acceleration and braking that must be used to maintain schedules under American congested street conditions. After many years of experience with court decisions on liability for accidents, American operators are shy regarding any feature which seems to offer an increase in the accident hazard.

The suggested double-deck car has an over-all length of 34 ft. with 70 seats and a standing capacity of 36, making a total passenger capacity of 106. This is not a material improvement over present American single-deck cars such as are used in large cities. The double-deck design, to be sure, affords some increase in seating capacity, but its total capacity is no greater than the large American single-deck car. In addition, the reduced headroom for double-deck design materially decreases the comfort for standees. A standing capacity of 36 in a double-deck car of the design suggested is materially above the standard permitted in London. On American double-deck buses the general rule is to permit no standees, or at most a very limited number, on the lower deck.

From the standpoint of operating economy, the double-decker offers no material advantage. It is inherently a two-man vehicle, particularly when carrying the loads suggested in the article. There would be no saving in employees on this 106-passenger double-deck car over two single-deck one-man cars of the same aggregate capacity. On the other hand, the single one-man units would give fewer and shorter stops, better schedule speeds and greater frequency of service for the same labor cost. There are very few situations in which the reduction in length due to double-deck design would offer a material advantage. Situations in which track capacity has actually become a limiting factor in carrying the loads encountered are very rare. This subject has been given greater prominence in discussions than is warranted by actual operating experience.

Don't Forget the Claim and Accounting Departments

FOR a number of years there has been a feeling among both claims men and accountants that the work of their respective associations, which offers much of value to the individual property through comparison of practices and development of better principles of organization and procedure, has been seriously handicapped by inadequate attendance at their annual conventions. At that time the work throughout the year of both these affiliated associations is brought to a head. Committees which have devoted themselves diligently to surveys of practices on many properties, and to the study of current problems facing these two important departments, report and discuss their findings. An individual claim agent or accountant can derive much of value to his own job. This is particularly true of those who have not had the opportunity of participating during the year in association and committee work.

There seems ample reason for the impression that there is a tendency on the part of executives to leave the claims man and the accountant at home when convention time comes. There may also be reason for questioning the extent to which some of those who do attend take part in the proceedings of their particular association. The subject is properly one to which this year's officers, both in the Claims Association and in the Accountants' Association, have given careful thought. They have gone further than that and have rightly asked the co-operation of the American Association officers in enlisting the interest of executives in the importance of the affiliated association programs.

Surely the subject is one that deserves the careful consideration of every forward-looking executive who is making plans for this year's convention. Don't forget the company's medical department. The Claims Association has given particular attention in its program to subjects in which the company doctor is vitally interested.

Art and the Street Car

NEVER, perhaps, was the boast "I'm from Missouri, you'll hafta show me" answered in a more satisfactory way than when the Kansas City Public Service Company adopted a color scheme for its cars as submitted by the Municipal Art Commission.

Paradoxically in being "shown," the Kansas company has shown the electric railway industry the logic of consulting civic and artistic agencies in the matter of selling transportation.

Had such a course been followed or suggested a few years ago the proponents would have been made the butt of every paragrapher and cartoonist throughout the nation.

Art and the street car! From the reactionist's standpoint, this association would be as comparable as ambrosia and sphagetti. But, thank goodness, most of this destructive type of thinking has vanished from the industry. Gradually artistic ideas have been recognized to play a part in the development of commerce, transportation, machinery and all the other "low brow" things that are inseparably bound up in the life of the average citizen.

Color technique, contour and the necessity for the main subject to have an esthetic background are no longer cloistered in the strict realm of art. Modern artists do not wish it so. They have sought an opening in business, but have been repelled up to a decade ago. They have proposed, but hidebound prejudice has disposed. Ignorance and the opinion that a group or groups of men can plumb the tastes of millions have been responsible for the millions of architectural and other abortions that nauseate the body politic of this country.

But back to art and the street car. Is there any more reason for the affinity of artistic ideas with steel and brick than there is for these ideas to go hand in hand with the moving servant of the public that speeds communication, binds city to city, makes a city into a neighborhood, annihilates space, overcomes inertia, rests the weary and performs a thousand and one other commissions of mercy and commerce?

The great mistake has been that some men have never been able to realize that the perfectly fitted gear, the humming motor, are as much the expression of art as is the portico of a Greek temple. If this be so, then why should not art control the color and form of cars? Imagine the revulsion which would result from an ugly picture being paraded before our eyes through miles of city streets day in and day out. Apply this to the street car, which is the picture of transportation and the symbol of civic service, and one then realizes the tremendous importance of the step taken by the Kansas utility. Art and the street car! May they never be henceforth divorced!

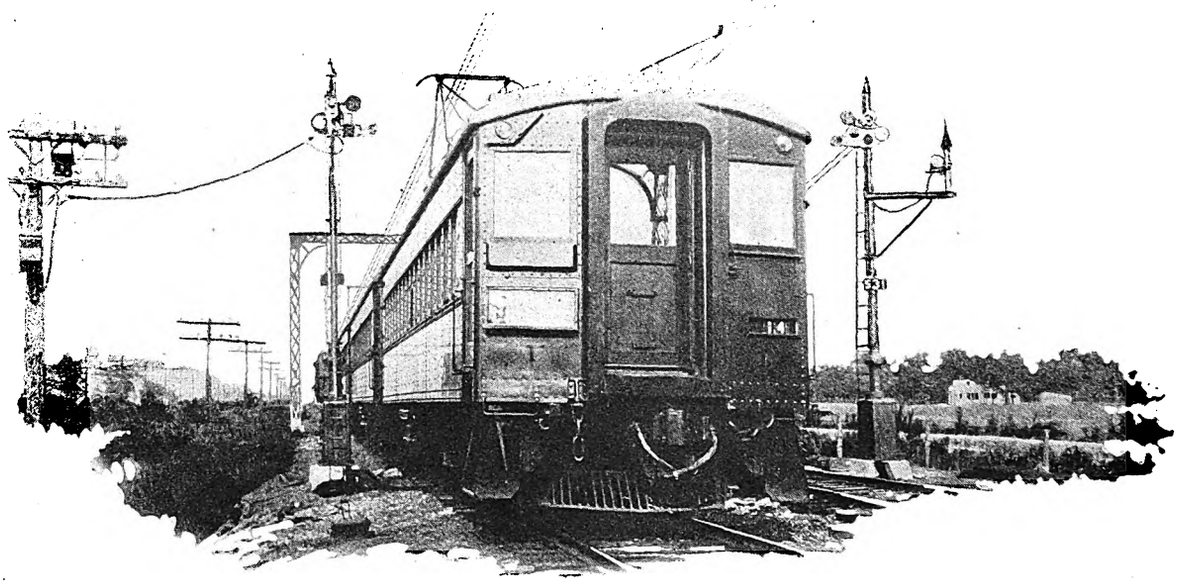
South Shore Line Rehabilitated

Through electric service now provided by the Chicago, South Shore & South Bend Railway between Chicago and South Bend through an operating agreement with the Illinois Central— Details of car equipment are given



A multiple-unit steel train on the South Shore Line. The type of block signals is also shown

REHABILITATION of the Chicago, South Shore & South Bend Railway entailed large expenditures for permanent way, grade separation, line reconstruction, new substations, new passenger rolling stock and locomotives. Adding to these features the introduction of more luxurious traveling accommodations, the system is representative of the most thorough and progressive methods of electric interurban railway operation.

The South Shore Line extends between South Bend, Ind., and Chicago, Ill., a distance of approximately 90 miles. It was originally electrified in 1908 with a 6,600-volt, single-phase a.c. contact line. The greatest step in advance since the South Shore Line was built was made late in August, 1926, when through electrically operated service between downtown Chicago and downtown South Bend was established and fast limited trains were operated hourly during the day out of each terminal instead of every two hours. The running time between terminals was decreased twenty minutes. Improvements were made possible by the new passenger equipment and the electrification of the Illinois Central suburban service, the tracks of which are used by the South Shore Line trains from Kensington (115th Street) to Randolph Street and Michigan Avenue, Chicago. Formerly South Shore Line crews left the trains at Kensington, a steam engine was coupled onto the trailers and Illinois Central crews took them to the Randolph Street terminal. The through operation makes possible a saving in time, does away with the inconvenience of two ticket collections and puts the responsibility for courtesy and service solely upon the South Shore Line trainmen.

Under the new schedule 60 trains are operated daily, of which 37 run limited between terminals and the balance provide local and express service. A fast train now leaves Chicago every hour, on the hour, between 5 a.m. and 11 p.m., with similar service in the opposite direction.

The beautiful Dunes region, at the southern end of Lake Michigan, is becoming more and more a summer playground and the South Shore Line is the only railroad reaching the region. The State of Indiana has acquired thousands of acres of this virgin land, unexcelled for beauty in the Middle West, for a state park. A hotel, amusement pier and other buildings are to be erected at the center of the area next summer by the state for the accommodation of visitors. Hudson Lake, in northern Indiana, surrounded by wooded tracts, is also served by the South Shore Line and various picnic parties, ranging from 50 up to 2,000 persons, have used special trains from Chicago for outings at this point.

New Rolling Stock Added

It is the expressed aim of the management to make the South Shore Line equal to any high-speed electric railroad in the country. To this end in slightly over a year more than $3,000,000 has been spent by the management for new passenger and freight equipment, new rails, rock ballast, station improvements and the conversion of the entire line from a.c. to d.c. Eight new substations, four with rotary converters and four with mercury-arc rectifiers, now supply the power.

Trains of from two to eight cars will be made up with normal units of one motor car and one trail car.

Digitized by Google

A different combination of cars may be arranged if desired, and inclusion of dining and observation cars in special trains is provided for.

At the start 30 motor cars and 32 trail cars, including observation and dining cars, were bought. Each motor car, with equipment, weighs approximately 130,000 lb. and will seat 56 passengers comfortably. Each trail car weighs approximately 75,000 lb. and has the same seating accommodations as a motor car.

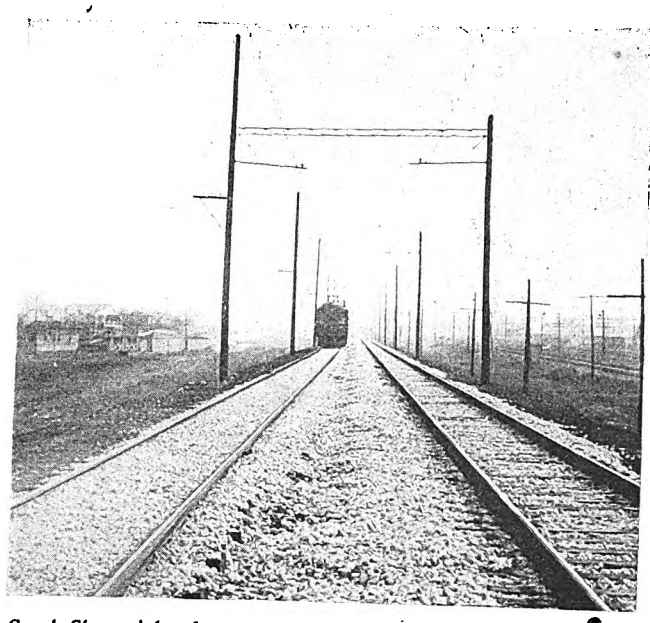
The electrical equipment of each motor car consists of four Westinghouse type 567-C-9, 750-1,500-volt d.c. traction motors controlled by Westinghouse type HBF electro-pneumatic unit switch control, working on a 32-volt auxiliary circuit. The control layout eliminates all direct connections between the main high-tension circuits and the master control circuits, the 32-volt d.c. supply for lighting and control being obtained from a motor-generator set and battery.

The control is non-automatic and consequently provides for a large variation in train make-up, together with the simplest arrangement of unit switch grouping. All master control circuits are operated from the 32-volt circuit.

Current collection is provided for by a spring-raised, air-lowered double-shoe pantograph. One trolley base with pole and sliding shoe is also mounted on each motor car for auxiliary or emergency use. Lightning protection is obtained by a type AR electrolytic arrester located on the car roof.

The line switch contains two unit switches connected in series which open simultaneously in case of overload, as well as when the master controller is returned to the "off" position. These switches are identical with those in the switch group and the box for housing them is the same.

The switch group contains eleven unit switches and a motor cutout switch. The box inclosing the group is made of structural steel members with sheet steel sides. There is no top terminal compartment. The main leads are brought directly from the various switch units through a bushing near the top of the group. Bolted connectors on these leads connect them to the cables from the car body.



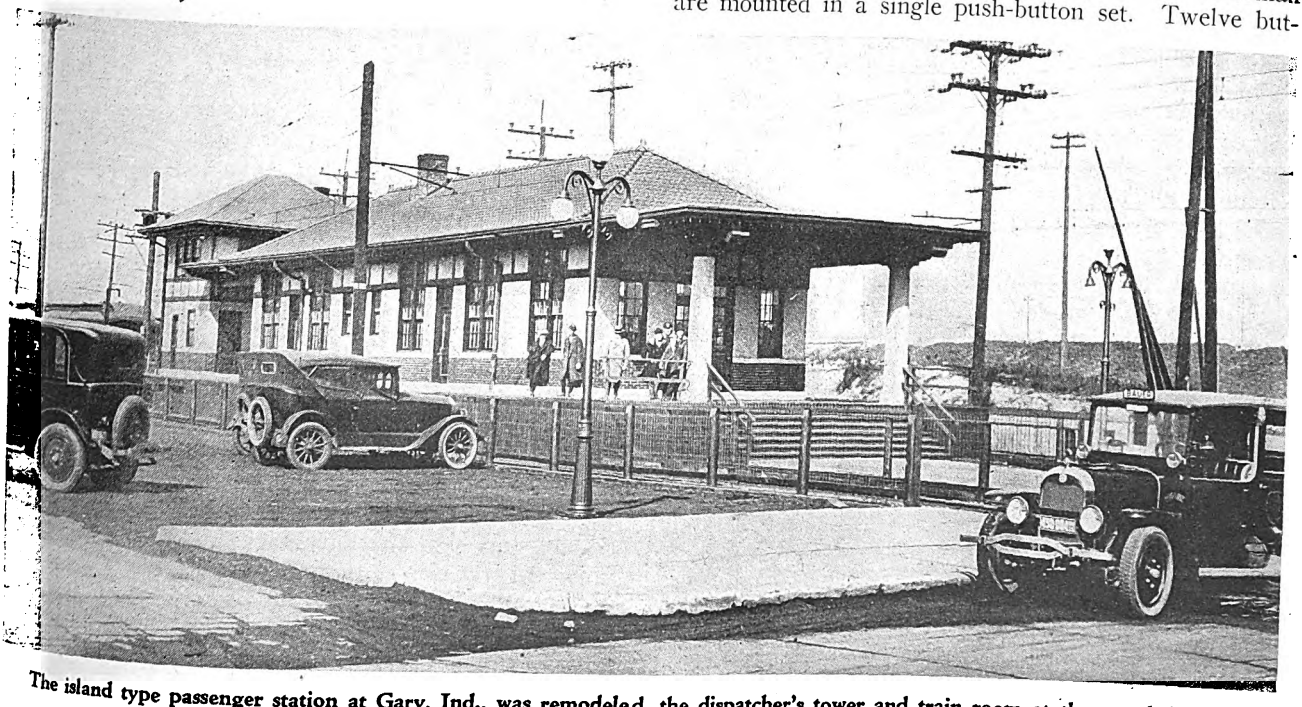
South Shore right-of-way near Hammond, Ind. New stone ballast, 100-lb. rail, catenary overhead and steel truss supports have been installed

In one end of the switch group is the motor cutout switch, which is of the knife-blade type and cuts out the motors in pairs. The switch group measures 59 in. x 18 in. x 25 in. and weighs approximately 1,100 lb.

The drum type reverser is operated by an electro-pneumatically controlled air engine. It is inclosed and mounted separately. A large margin of capacity has been provided by an improved type of finger, the pressure of which is maintained over a considerable deflection by a strap of spring steel.

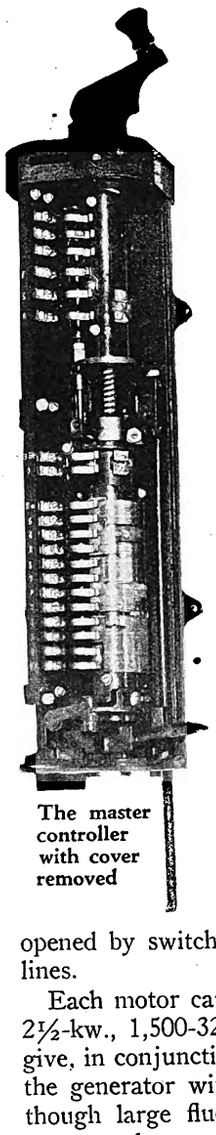
A type XM master controller is located at each end of every car, both motor and trailer, in order to obtain a maximum of flexibility in train assembly. It is similar to those used extensively on the Chicago elevated lines. The controller has ten notches, five series and five multiple, the last multiple position giving the short field connection on the motors.

All of the control switches operated by the motorman are mounted in a single push-button set. Twelve but-



The island type passenger station at Gary, Ind., was remodeled, the dispatcher's tower and train room at the rear being new

Digitized by Google



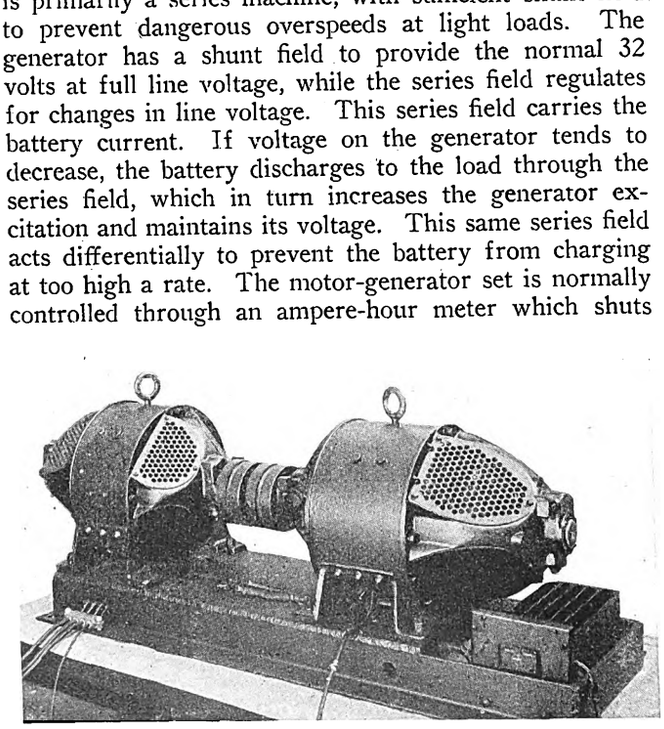
The master controller with cover removed

tons mounted in a row control the pantograph, headlight, line switch reset and the contactors which open and close the circuits to the cab heaters. A similar push-button set, mounted on one of the bulkheads of the car to be operated by the conductor, contains switches to control the car lights and the contactors which close the car heating and the compressor circuits. This does away with the necessity of the train crew handling any 1,500-volt apparatus or switches. The magnetic contactors for the 1,500-volt supply to the motor-generator set, compressor and heater circuits are mounted together in a box attached to the car underframe.

Control circuits will be carried between cars in two separate train lines, keeping any one jumper down to a size easy to handle. One train line will carry all the circuits necessary for the main motor control. The other train line carries wires for the pantograph control and also the generator and battery positive and negative wires. There is also a 1,500-volt bus line which feeds the auxiliary 1,500-volt circuits on the trail cars. The 1,500-volt bus line receptacles are protected by contactors which are opened by switches on the angle cock of the air brake lines.

Each motor car and each trail car is equipped with a 2½-kw., 1,500-32-volt motor-generator set, designed to give, in conjunction with a battery, a close regulation on the generator without external regulating devices, even though large fluctuations occur in line voltage. Both motor and generator are compound wound. The motor is primarily a series machine, with sufficient shunt field to prevent dangerous overspeeds at light loads. The generator has a shunt field to provide the normal 32 volts at full line voltage, while the series field regulates for changes in line voltage. This series field carries the battery current. If voltage on the generator tends to decrease, the battery discharges to the load through the series field, which in turn increases the generator excitation and maintains its voltage. This same series field acts differentially to prevent the battery from charging at too high a rate. The motor-generator set is normally controlled through an ampere-hour meter which shuts it down when the battery is fully charged and starts it up when the battery has been 15 per cent discharged.

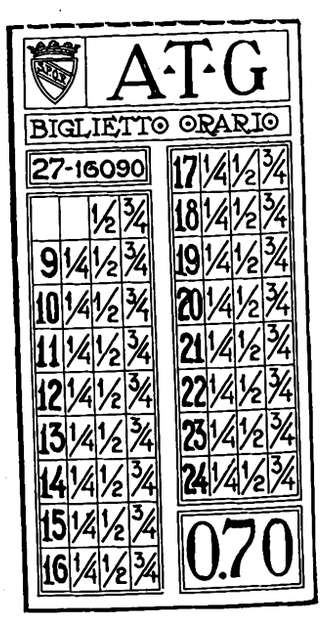
In addition to being controlled by an ampere-hour meter, the motor-generator set is also started up automatically whenever the main car lights are turned on. This insures, at all times, a voltage close to normal for the car lights and also keeps a good reserve charge in the battery.



Control motor-generator set ready for mounting

Rome Adopts Universal Transfer

ALTHOUGH most of the Italian tramways charge a flat fare within city limits, transfers are a rarity. Instead, the systems have a very large number of routes so that a passenger, by waiting a short time, can usually find a car passing the point at which he is waiting to take him to his desired destination. Within the last few months, however, the management of the Rome Tramways decided to adopt a universal transfer system. It finally selected the form illustrated, which is notable because of the absence of the designation of any transfer or terminal points. It is simply a "pass," good on any line for one hour from the time of its issue. This interval was taken as approximately that required to make a continuous journey from any point to any other point on the system. If more time is taken, even if caused by car delays, the passenger must pay another fare, because the ticket is not valid for a point-to-point ride. It is simply a pass, good for one hour. Only one punch is required, that of the time of issue. When the punch is made the passenger is given the benefit of fractions of one-quarter of an hour.



Rome adopts as transfer a pass good for one hour

In the ticket shown the hours begin at 8:30 a.m. and are carried up to 12:45 a.m. This is because a workmen's reduced fare is charged between 5:45 a.m. and 8:30 a.m. and higher "owl" fares are charged in the early morning. A similar ticket to that reproduced but with different numerals is sold during workmen's hours.

The ticket shown is sold for 20 centesimi (about 1 cent) more than the ordinary flat fare of 2½ cents. The early morning hourly pass is sold for ½ cent more than the workmen's flat fare of 1¼ cents. There is, of course, some chance that a traveler will double back on the ticket shown, if he can make both trips within an hour, but the Rome management believes the extent of such use of the ticket will be slight and its dangers do not outweigh the advantages of having as simple a universal transfer as that shown.

To the standard flat rate of 2½ cents, mentioned above, the Rome system adds a ½-cent supplement on Sundays, making the fare 3 cents, and turns over the extra receipts to the city's anti-tuberculosis fund. Its night fare is 70 centesimi, or 3½ cents.

De Luxe

Interurban Cars Placed in Service

by the Houston North Shore Railway

Texas company competes for traffic with light-weight one-man cars of attractive appearance and unusual interior appointments

Four of these light-weight de luxe one-man cars are now serving interurban passengers of the Houston North Shore. Careful attention was given to the lines of the body and roof

PATRONS of the Houston North Shore Railway, which operates between Houston, Harrisburg, Lynchburg, Goose Creek, Seabrook and Texas City, Tex., are admiring the company's new rolling stock —four 44-ft. 4-in. single-end, double-truck, combination de luxe passenger smoking and baggage cars. These cars, which were delivered recently by the American Car Company of St. Louis, represent a skillful combination of streamline design with luxurious appointments intended to offer an attractive appeal to passengers.

Several novel features have resulted from the effort which was made to build a car that would be attractive to passengers. Considerable attention was given to the exterior lines and the general proportions of the car. It was the desire here to eliminate awkward angles and curves and to produce a general "racy" effect to give the impression of gracefulness and speed. The roof curve is very low. This, it was felt, tends to eliminate the topheavy appearance produced by a high arch.

From the front end the appearance is quite conventional. At the rear end, however, advantage is taken of the single-end operation to work out an observation effect for the combination smoking and baggage compartment. The general result from the exterior more nearly approximates in appearance a de luxe intercity bus than the conventional interurban car.

Several striking things have been done on the interior. The customary practice of using natural wood finish has been abandoned entirely and the interior woodwork is painted in shades of gray and green with panel striping very similar to that used in the latest types of Pullman and steam road parlor cars. Although there are only four of these cars a different color combination is used for each, and in each case colors of seats, floor covering and interior paint are selected to form a harmonious combination.

Two things are accomplished by this plan of varying the interior color scheme of each car. Its very novelty is expected to attract the attention of passengers to the luxurious facilities provided. Furthermore, by thus having each car different it was felt that the monotony of riding constantly in vehicles of one color would be relieved and that the attractiveness of pleasant surroundings would help to win automobile drivers to the railway.

Near the rear end of the body a stationary steel partition located at the fourth window post from the rear divides the main passenger section from a combination baggage and smoking compartment that is equipped with two-passenger cross-type seats, well padded and upholstered in leather of the same quality as that used on the seats in the main passenger section, and a folding slat seat. In front of the two cross-seats there are folding tables.

The smoking compartment partition is provided with a 22-in. door of wood fitted with one glazed sash. A toilet room occupying the space of one window section has been provided in the passenger section, on the left-hand side of the car and adjacent to the partition. This toilet room is built of steel with a solid panelwood door. The bus pattern rear vestibules are fitted with three sash,

Main passenger compartment. Seats are upholstered in leather. Interior trim is painted and striped similar to the most recent practice in Pullman cars

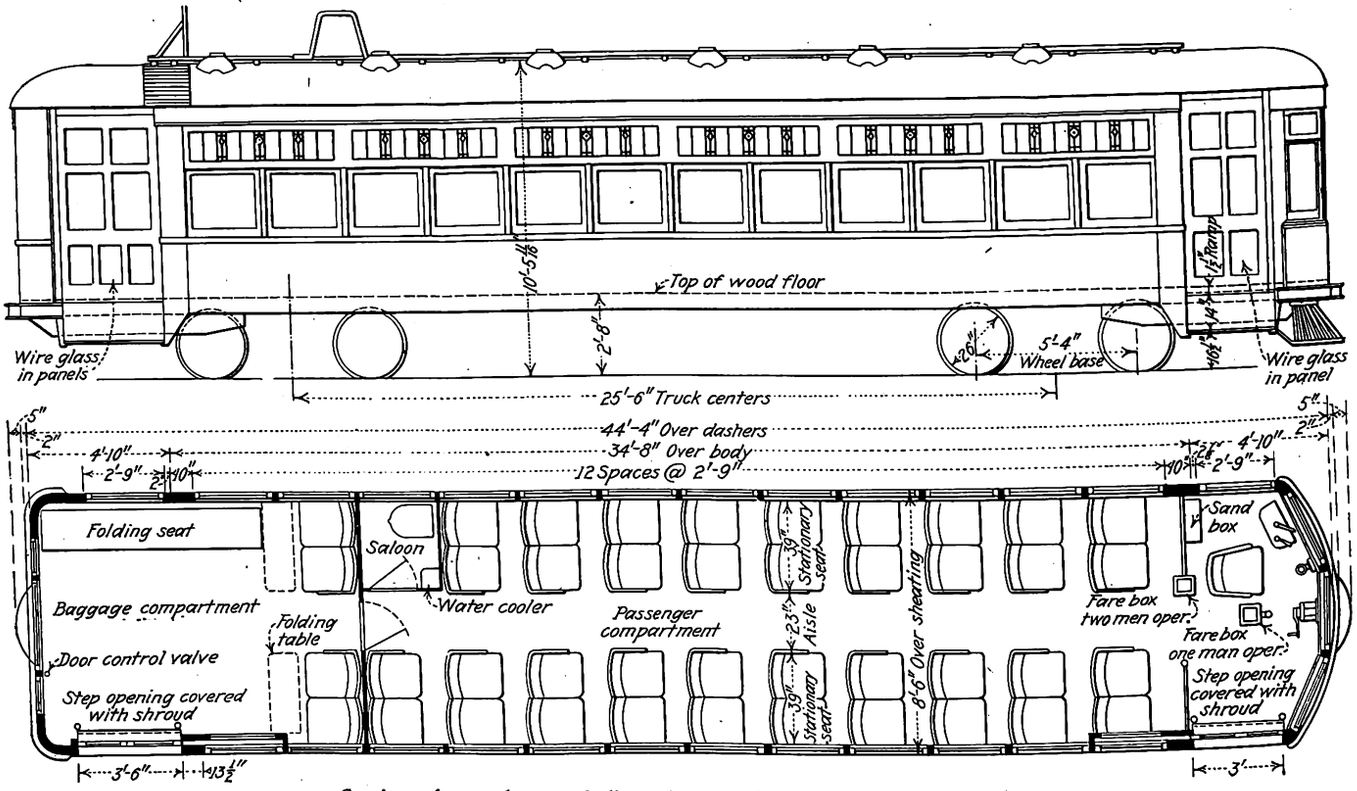
the double top sash stationary. Completing the flexible arrangement of this vestibule is the 42-in. door opening on the right-hand side and fitted with a sliding door. Both front and rear doors have door engines and all safety device mechanism. The rear door is under the conductor's control by means of a valve.

Side sheets of the body structure are No. 13 gage steel. The body frame end is stiffened at each corner with pressed steel pier panels 10 in. wide riveted to T-iron side and corner posts extending from side girders to letter panels and riveted to them. Tongue and groove poplar, ⅜-in. x ½-in., sheaths the flat arch roof, which is covered with heavy-weight canvas. The pine floor is covered with ¼-in. rubber tiling glued in place.

The upper sash is of one continuous length, Pullman type, glazed with prismatic glass of Gothic pattern and framed so that each top sash section extends over two lower sash. Vestibule end sash and doors are of $\frac{3}{16}$-in. polished plate glass and the bottom panels in the sliding doors are reinforced with netting.

Birch sash and doors, Agasote for the wainscoting and headlining, oxidized bronze trimmings, an 8-in. x 10-in. wood order board, located between the controller and brake valve, double prong coathooks and Curtain Supply Company's curtain fixtures are some of the attractive features of the interior.

In the main passenger compartment each car is equipped with eighteen bucket type, leather-upholstered, stationary seats and one longitudinal seat. The seats are 39 in. over all, with high backs. Cushions and backs are of deep spring construction. Pressed steel is used for the aisle end brackets, pedestals and arm rests and



Seating plan and general dimensions of the Houston interurban cars

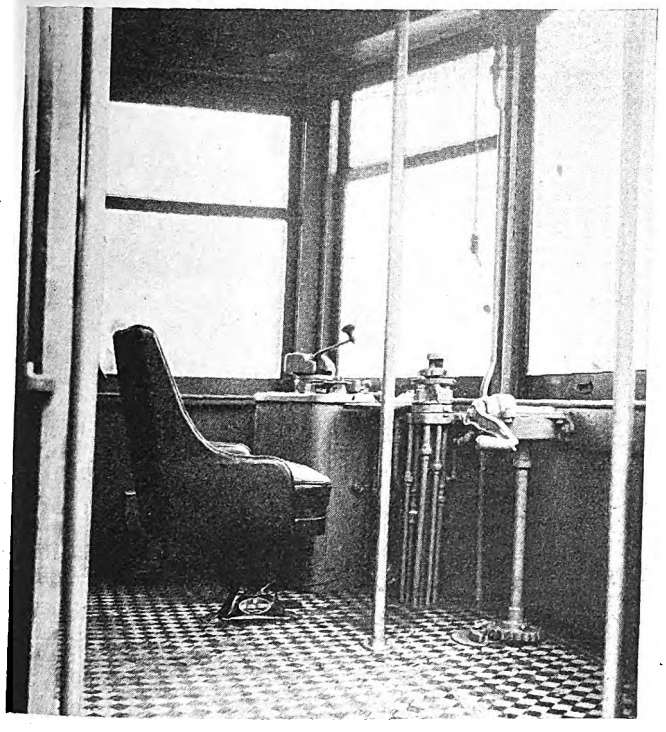
the grab handles are of aluminum. The motorman has been provided with the Brill bus pattern seat.

Each car has been wired in four circuits of five lights each, one circuit including the two lights in the front sign box and three lights in the smoking compartment. Flush-type porcelain receptacles without shades comprise the lighting fixtures in the main compartment and smoking room. All body and platform lights are of the 50-watt mill pattern, with the bottom half frosted. Emergency lighting is provided with five 4-cp., 6-8 volt lamps in each marker light and one in the center of the passenger compartment ceiling.

Crouse-Hinds Imperial arc headlights were specified. Miscellaneous equipment includes: Window screens of



The front vestibule is neat and trim. A leather upholstered seat insures comfort for the operator. Between the brake valve and controller is a convenient shelf for train orders

brass fly wire, a Pyrene fire extinguisher with cabinet, motorman's climbing steps, Ohio Brass trolley retrievers, twelve Brill exhaust type arch roof ventilators, Hunter destination signs, Duraduct power wiring and safety car equipment.

The mechanical equipment consists of Brill 177-E-1 trucks, four General Electric 35-hp. motors, single-end air-brake equipment including a C.P.-27 compressor, one straight air valve and air whistle, and an air brake back up valve. General dimensions of the cars follow:

Length over dashers	44 ft.	4 in.
Length over body	34 ft.	8 in.
Length of platform over dashers	4 ft.	10 in.
Bumper projection (each end)		2 in.
Rail to top of trolley boards, approximately	10 ft.	8 in.
Rail to underside of sill		27⅜ in.
Extreme width	8 ft.	8⅜ in.
Width over side plates	8 ft.	6 in.
Rail to first step (front end)		16½ in.
First step to second step (front end)		14 in.
Ramp in platform floor		1½ in.
Door opening (rear end)		42 in.
Door opening (front end)		36 in.
Truck centers	25 ft.	6 in.
Wheelbase	5 ft.	4 in.
Size of wheels		26 in.
Post centers		33 in.
Width of aisle		23 in.
Width of seats		39 in.
Seating capacity		46 in.
Height from floor to underside of ceiling	7 ft.	7 in.

New Jersey Bus Regulations Revised

REVISED motor coach regulations adopted by the Board of Public Utility Commissioners in New Jersey following considerable study of the subject and co-operation by the motor coach division of the Society of Automotive Engineers contain several important changes from the old regulations adopted in 1924. One of these is the dividing of motor coaches into city type single-deck vehicles and the parlor car type, with a clear division of the regulations applying to each class.

One of the most important changes is that the emergency door may be located in the center rear or elsewhere as the Board of Public Utility Commissioners may direct. Motor coach builders and operators contend that the best location is at the left side of the rear instead of at the center of the rear.

Instead of specifying a maximum length of body of 24 ft., the new regulations provide that the minimum length of body shall be 16 ft. and the maximum length of the vehicle with body shall not exceed 28 ft. The body width shall be between a minimum of 7 and a maximum of 8 ft. and the inside height at the center shall be between a minimum of 6 ft. 4 in. and 6 ft. 9 in. in the city type motor coaches and shall be 5 ft. in the center in the parlor car type. The body must not overhang the rear axle by more than $\frac{7}{24}$ of the total length of the vehicle, nor overhang the rear of the frame by more than 15 in.

The regulation with regard to the chassis frame has been changed so as to require that it be designed and constructed properly and safely to carry the body with its full passenger load. The top of the frame in city type coaches must not exceed 32 in. from the ground and in the parlor car type must not exceed 30 in.

Another notable change is that the exhaust pipe, including exhaust heater pipes, shall be extended to the rear end or to a point immediately in front of the left rear wheel. This revision is in line with the claims of motor coach operators who have found that by discharging them into the agitated air in and around the wheel housing the exhaust gases are mixed with the air and thus diverted from the air whirl at the rear of the body.

The new clause relating to brakes requires not less than two sets of brakes, each operating independently of the other, except that with four-wheel mechanical brakes two separate controls alone will suffice. Another provision is that the gasoline tank shall not be located within the body and that it shall be filled and drained from the outside.

Financial Aid in Brooklyn Amounts to $1,269,536

DURING a quarter of a century of service of the Employees' Benefit Association of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., completed last May, its financial aid to its members and their dependents in times of sickness, injury or death totaled $1,269,536. The total dues and other fees paid in by the members during the past 25 years were $1,229,474. The total disbursements for all purposes by the association during the first quarter century of activity aggregate $1,569,218. Of this sum more than half was paid out in sick benefits direct to members. The total payments for sick benefits were $888,123, while the total death benefits paid in the same period amounted to $381,413.

Corrugation Studied at Montreal

Investigation indicates that character of rail surface is more influential than internal structure

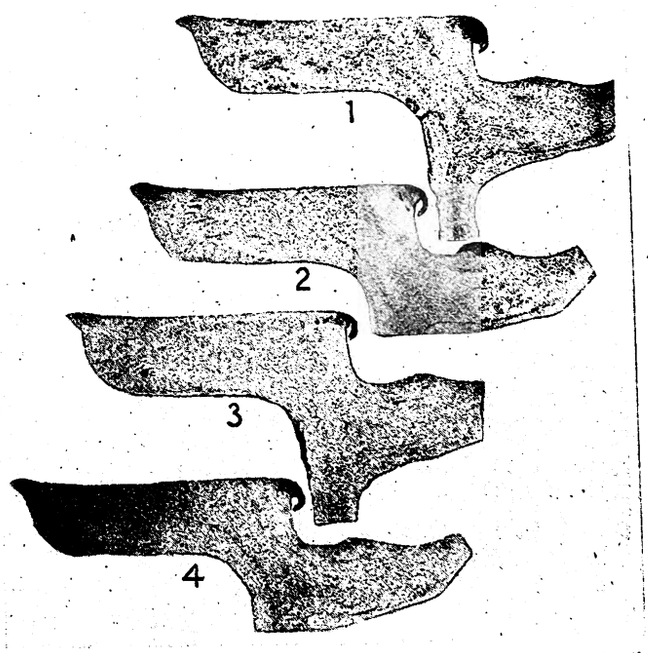
IN CONNECTION with the work of the committee on rail corrugation of the Canadian Electric Railway Association specimens of deeply corrugated rail were removed from service in Montreal, plan and profile drawings prepared from them, the corrugations photographed, observations on hardness made over the running face and microphotographs secured of cross sections at crests and valleys of the corrugated spots. This investigation was carried out by Gordon Sproule, M.Sc., assistant professor of metallurgy McGill University.

Specimens examined were (a) parts of four transverse slices of a lipped rail, punch marked (.) (..) (...) and (....), which had been cut alternately from the troughs and crests of the waves in a badly corrugated rail, and (b) a length, about 40 in., of the head of the rail. The slices, as may be seen from an accompanying illustration, showed the rail to be badly worn. The head was worn down until the wheel flanges ran on the lip, and in places the latter was stripped off.

The length of rail head had been cut off the web, presumably parallel to the base of the rail. It showed a very decided camber, being convex up, evidently due to the release of compression stresses in the wearing surface, developed by the rolling and pounding of the wheels. According to the report, this circumstance suggests a feature in the manufacture of rails which may be worthy of consideration in connection with corrugation.

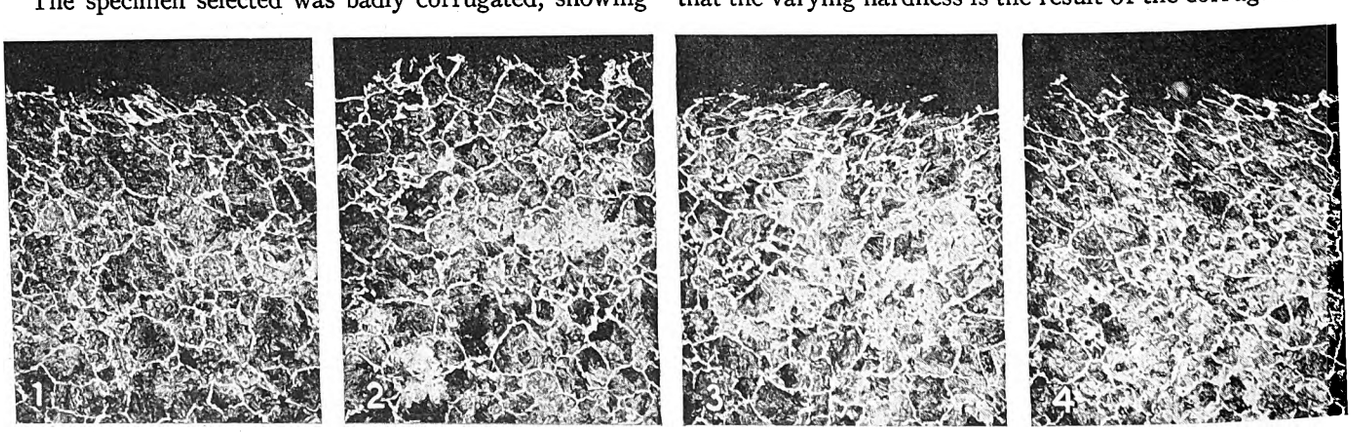
Rails, when they are rolled, are given a definite camber (head convex) when hot, because, as they come from the rolls, the lighter base and web are at a lower temperature than the heavier head, and the camber counteracts the greater shrinkage of the head as the rail cools, so that the rail is straight when cool. No doubt the temperature variations and amount of camber required are occasionally misjudged, resulting in rails that have a camber after becoming cool and necessitating a straightening operation. It would seem highly desirable that specifications for tramway rails require that such straightening be done in rolls and not step by step in a press.

The specimen selected was badly corrugated, showing in the 40 in. three distinct hills (or crests), a double hill or plateau and four vales (or troughs). Besides the visual examination, the head and cross-sections of the rail were tested for hardness and examined microscopically.



Four transverse slices taken for examination from a piece of badly corrugated rail in Montreal, the first and third being from the troughs and the second and fourth from the crests of the waves

Brinell impressions were made approximately along the center line of the wearing surface of the 40-in. length of head, spaced a little more than 1 in. apart; 31 impressions were made in 38 in. The figures are given in an accompanying table. A distinct and consistent relation is apparent between the hardness and the hills and vales of the corrugations. It is obvious, the report states, that the corrugations are not the result of varying hardness, but that the varying hardness is the result of the corrugations.



The appearance of the slices after surfacing and etching was much the same for all four specimens

BRINELL HARDNESS READINGS ALONG CENTER LINE, TOP OF HEAD

Position	Hardness	Remarks	Position	Hardness	Remarks
1	271	.....	17	244	.....
2	269	.....	18	262	.....
3	255	.....	19	269	Vale
4	248	Hill	20	269	.....
5	255	.....	21	255	.....
6	264	.....	22	243	Hill
7	269	Vale	23	254	.....
8	269	.....	24	253	Plateau
9	255	.....	25	255	.....
10	255	Hill	26	255	Hill
11	255	.....	27	263	.....
12	255	Vale	28	277	.....
13	269	.....	29	269	.....
14	269	.....	30	269	Vale
15	255	.....	31	255	.....
16	241	Hill			

At first sight it might seem probable that the rising side of the hills would be the harder, but the specimen is a left-hand rail and the falling side of the hills is consistently the harder, except at the so-called plateau. These facts suggest further study to see how the severity of the corrugations is related to the irregularity of spacing and how the hardness relation varies with the irregular wave spacing.

Even lacking this information, there would seem to be no doubt that the frequency of the waves, which are equally spaced, in the specimen rail, as they were encountered by wheels of cars moving at the average speed for the location, synchronized with the natural period of vibration of the wheels and axles, as governed by their weight and the character of the spring gear. This synchronism would be only slightly affected by the natural period of the rail and its foundation, and the pounding effect would be aggravated by a solid foundation. This argument points to advantages (1) in heavy wheels and axles and flexible spring gear, resulting in a low frequency vibration, longer waves, and easier riding cars, and (2) in designing several different truck constructions, so that an incipiently corrugated rail might be as little as possible subjected to synchronous pounding of one common frequency. In any case, probably the waves gradually move along the rail as wear proceeds, and their final position bears no relation to the position of any original crest or hard or soft spot that started the growth of corrugation.

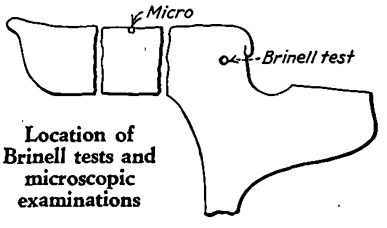
Brinell hardness tests were also made of the slices, at a central level in the head, nearly above the web, as shown in an accompanying sketch, with the following results:

Slice No.	1	2	3	4
Brinell No.	251	255	248	241

This interior hardness is about the same as that of the hills and, of course, shows much less variation than the surface hardness readings. The Brinell tests show the steel to be very hard.

The four transverse slices were surfaced by hand and deeply etched. They were photographed in pairs to make comparison easier and are shown in accompanying pictures. As may be seen from the illustrations, no great differences of structure were apparent; the steel is reasonably uniform throughout the section and from section to section. The flow line produced in rolling are indicated, in the region where the head and web join, by segregated constituents, and traces of a rim of blowholes show in the outer part of the head.

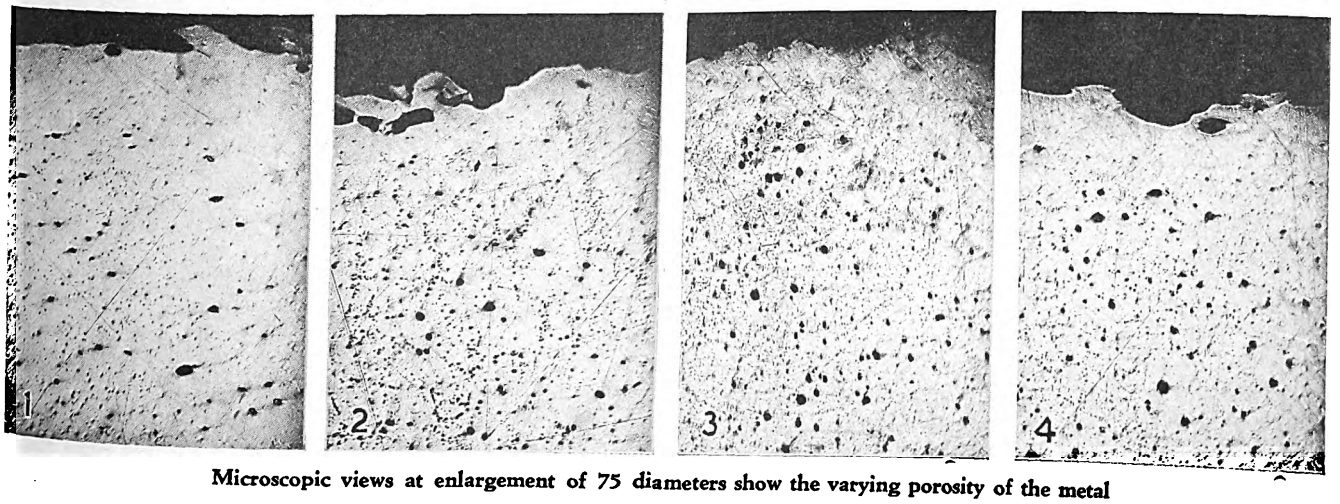
A sample was cut from each of the four transverse slices, in the position shown in the sketch. The effects of the previous deep etching were ground out and the same cross-sectional faces of the samples were polished for microscopic examination. An area, including the edge of the top surface, as shown in the sketch, was photographed in the plain polished condition to show the soundness or porosity of the metal. These are reproduced herewith. All micrographs were made at a magnification of 75 diameters. While photographs made under these conditions are apt to be misleading because the appearance produced depends a great deal on the technique of polishing and photographing through the exaggeration of very minute pores, it may be said that the size and number of the larger pores are about the same in each slice; No. 1 was evidently less eroded in the polishing and Nos. 2 and 3 more so than No. 4.



Location of Brinell tests and microscopic examinations

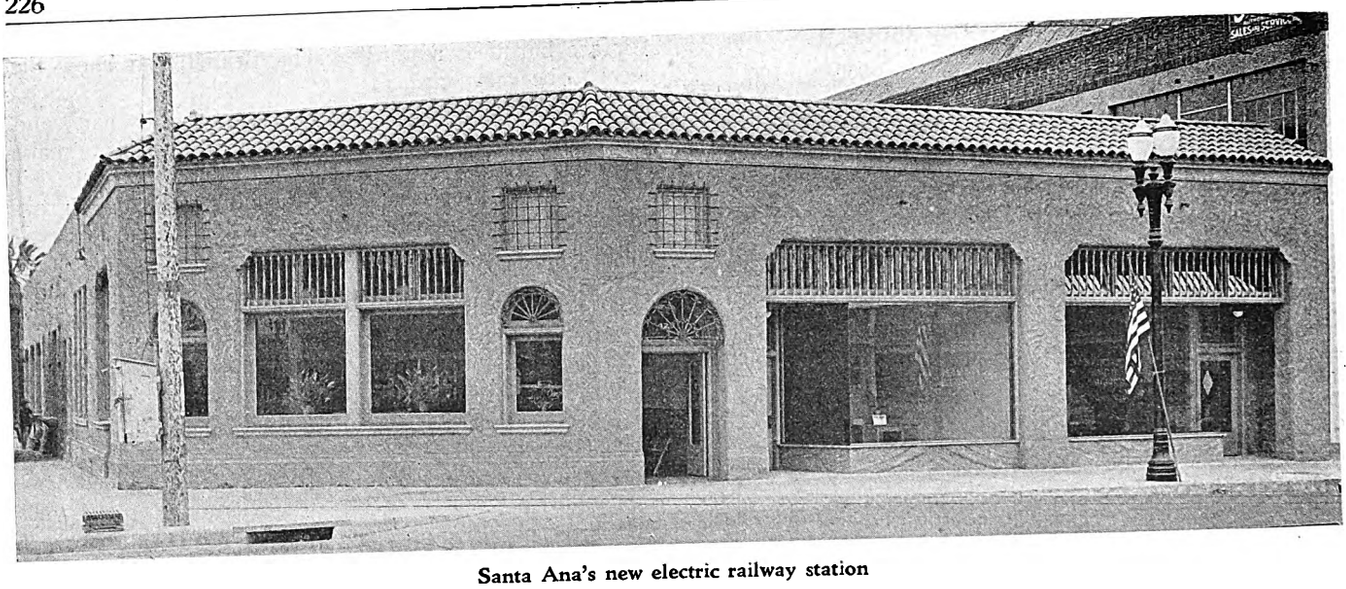
The photographs show very high carbon steel, probably between 0.7 per cent and 0.8 per cent C., in the slowly cooled condition; this agrees with the Brinell hardness figures obtained. The grain size is medium and the same from section to section, as would be expected.

An interesting thing is the visible result of the cold-work pounding and dragging done on the rail by the wheels. This is quite evident, although the sections are transverse and not longitudinal and although an appreciable amount of the surface metal was removed in the previous deep etching. The deep etching also accounts for the jagged appearance of the edge. In samples 1 and 4 the effect is visible to a depth of about 1/50 in. and is away from the lip of the rail. In sample 2 there is



Microscopic views at enlargement of 75 diameters show the varying porosity of the metal

Digitized by Google



Santa Ana's new electric railway station

no sign of the cold-work. This agrees with the fact that 2 was cut at a hill-crest and that the crests are soft compared with the values. Why No. 4, which was also from a crest, shows so distinctly the cold-work effect cannot be explained, but it may be pointed out that its head thickness is considerably *less* than that of 3, said to be from the adjacent vale. In sample 3 the apparent depth of the cold-work effect is less than in 1 and 4, agreeing with the greater head thickness, and the dragging effect seems to be in the opposite direction to that in 1 and 4, namely, toward the lip of the rail.

Under the microscope the lower, unworn side of the head is seen to have a layer of considerable thickness of partly decarburized metal. The amount and uniformity of this layer on the original wearing surface would no doubt be a factor in the tendency of the surface to develop waves.

Preliminary conclusions drawn from this investigation are: (1) The rail should be rolled straight and not kinked by "gagging." (2) The character of the original surface, as regards uniformity of hardness and soundness, would be a factor in the starting of waves. (3) The internal structure probably has no effect—the present very badly corrugated rail is very hard and uniform. A rim of sub-surface blowholes might have some effect, but the surface conditions would be the main factor, as stated in (1) and (2). Thus, while sound steel is in general preferable to rimming steel, a more direct benefit would be incurred by the use of the Lackawanna "de-seaming" process—if it is still in use—than by insistence on dead-setting sound steel. (4) Synchronized pounding of the wheels would seem to be a most important factor. Efforts might be made to reduce and to vary the frequency of the natural period of wheels and axles.

New Station Opened by the Pacific Electric Railway

WITH fitting ceremonies, participated in by civic organizations and officials of the system, the Pacific Electric Railway, Los Angeles, Cal., opened a handsome freight and passenger station at Santa Ana, Cal., on June 18. Exclusive of the land, it represents an expenditure of approximately $40,000. Of Spanish architecture, the new structure occupies a ground space of 70x250 ft. The waiting room is located in the front of the building, providing easy access to all trains; the office is in the middle, and the freight warehouse in the rear. The layout is so arranged as to provide a space in the rear between the station and the adjoining building, which provides ample room for vehicles using the freight loading platform. There is also an entrance from the rear platform to the main office that permits business to be transacted without the necessity of patrons making the customary trip from the warehouse, around the building, to the front entrance.

Aside from the Pacific Electric station, the building will be occupied by the American Railway Express Company and a light refreshment parlor.

High-Tension D.C. Development

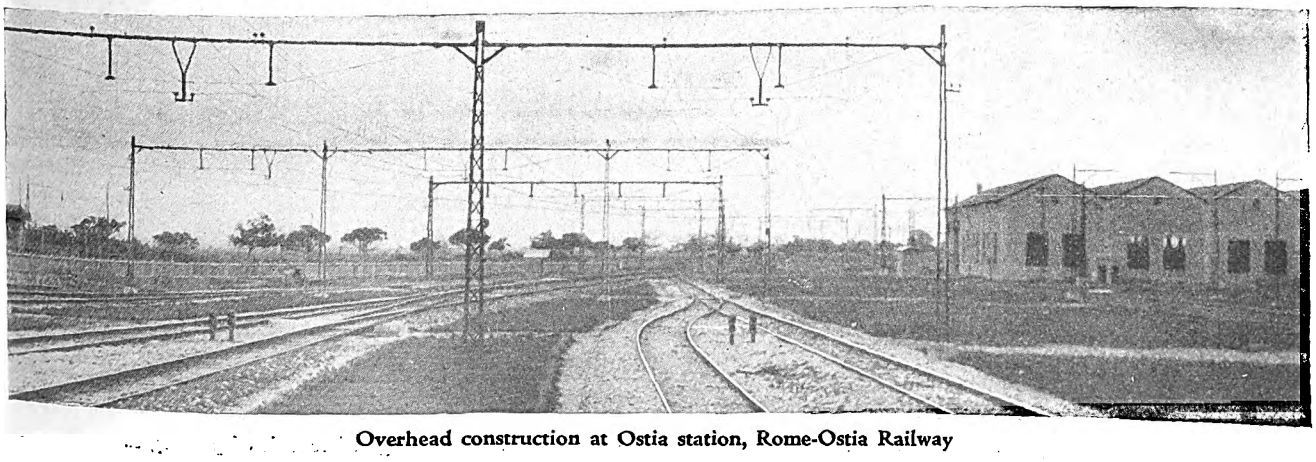
in Southern Italy

Rome-Ostia Railway, operating high-speed suburban service to seashore resort, is an example of 2,600-volt line. Another line selected for d.c. equipment extends from Naples to the Adriatic

By Henry W. Blake
Senior Editor ELECTRIC RAILWAY JOURNAL

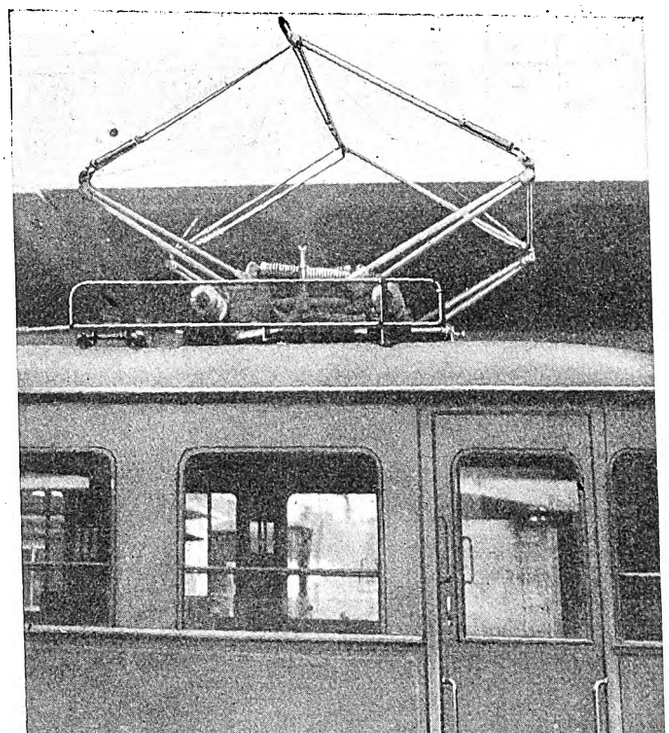
RAILWAY electrification has proceeded rapidly in Italy because of the abundance of water power and the scarcity of fuel. Italy possesses no coal deposits of moment, and the coal required for its steam locomotives has to be imported. On the other hand, the Alps and the Apennines possess many streams which are being harnessed for the production of electrical energy.

One of the latest heavy electric traction undertakings, as well as one of the most interesting for many reasons, is that joining Rome with Ostia, 20 km. (12½ miles) away. Ostia is near the mouth of the Tiber River and in ancient times was the port of Rome. Now its former harbor is largely filled up and it has lost its commercial importance. Instead, it is the resort of the pleasure seeker and the antiquarian. The latter is interested in the ruins in the "old town," the former in the modern seaside resort of the "new town," some little distance away. In fact, Ostia Mare, the new town and terminus of the electric railway, is the principal shore resort of Rome. It has handsome villas, casino, bathing houses,



Overhead construction at Ostia station, Rome-Ostia Railway

Digitized by Google



The Rome-Ostia motor cars carry two pantographs, one at each end

hotels and restaurants and all the accompaniments of a Long Beach or Atlantic City, though much smaller than either of these well-known American resorts.

The Rome-Ostia Railway is not a part of the Italian trunk line system. It is owned by a private company and is really a double-track rapid transit line, designed primarily for excursion and commuter travel. Because of such service its cars are built wider than standard trunk line coaches, the cross seats accommodating three passengers on one side of the center aisle and two passengers on the other side of the aisle. Motor car operation with trailers is used. A chief feature of interest is the use on the trolley wire of 2,600 volts in a country which up to the time of its construction was committed (at least so far as main line electrification is concerned) to the three-phase system.

The Rome-Ostia Railway is owned by the Società Elettroferroviaria Italiana, which also owns the Casino and adjoining bathing pavilion with more than 500 rooms at the Ostia terminus. The same company also owns a great deal of land, which is being sold for building purposes in plots, in quite the American style, often on the installment plan. Much of this land was received as a subsidy from the government for the construction of the line, under the franchise which the company received on May 5, 1924.

The service is naturally more frequent in summer than in winter and on Sundays and holidays than on weekdays. At present, the shortest headway in summer between trains is fifteen minutes, when the system would have a capacity of 5,000 passengers an hour. The fare one way is 4 lire (20 cents) and the round trip fare is 6.80 lire (34 cents). A combination ticket, providing for the railway trip each way, admission to the Ostia excavations and to the Casino, and giving a discount of 15 per cent on refreshments purchased at the railway company's restaurant at Ostia, is sold for 11 lire (55 cents). There is no division of passengers into classes.

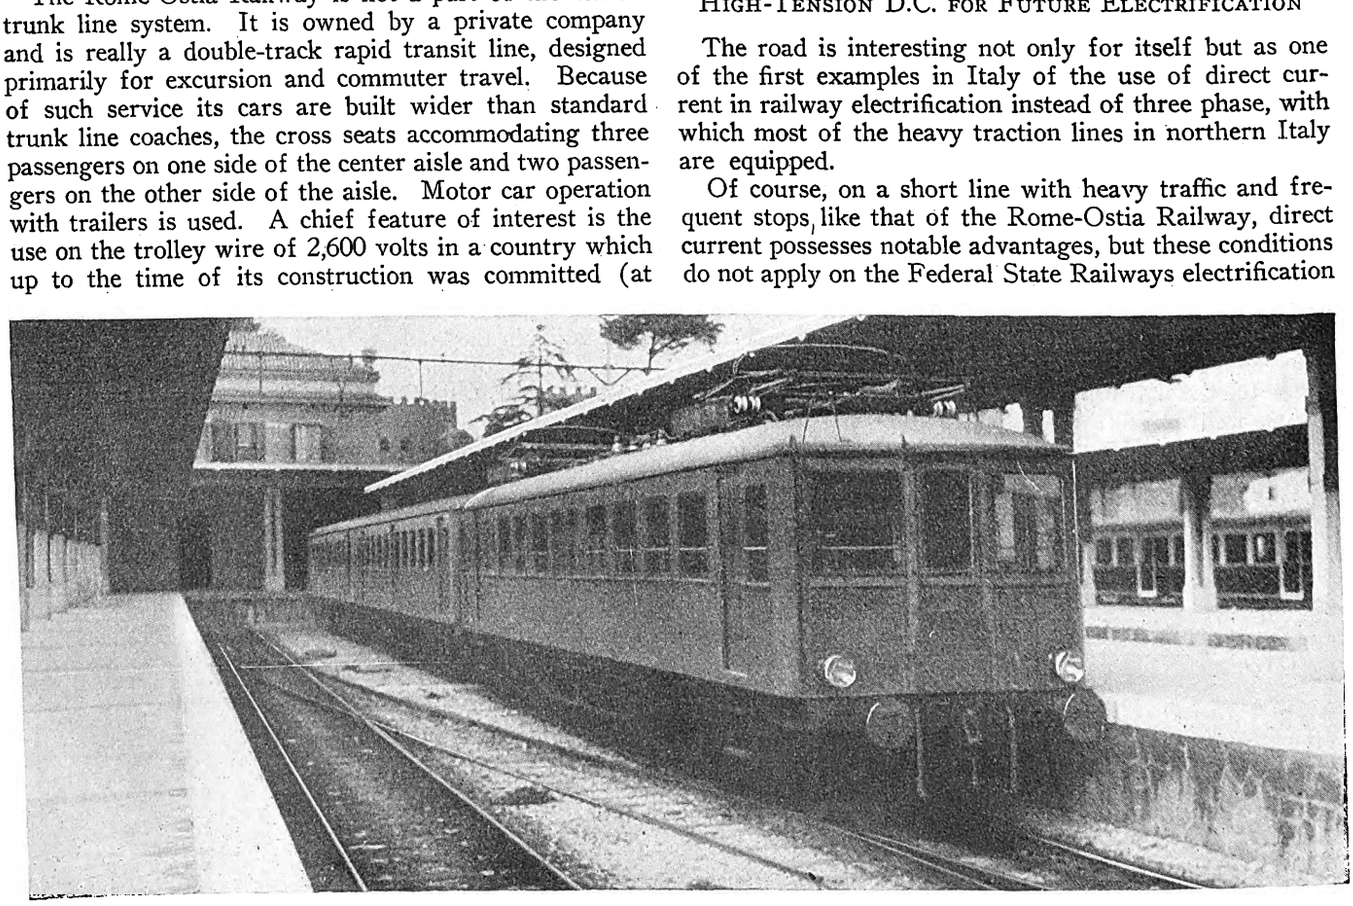
The cars are shown in the accompanying illustrations. They are about 10 ft. wide and seat 80 passengers, with standing room for about 50 more passengers, in each car. Four motors are used on the motor car and the controller provides for six series and four parallel running positions, as well as for points for electrical braking. The motor car carries two pantographs.

The overhead system, which is of the catenary type, is carried on trusses, as shown in the accompanying engravings.

High-Tension D.C. for Future Electrification

The road is interesting not only for itself but as one of the first examples in Italy of the use of direct current in railway electrification instead of three phase, with which most of the heavy traction lines in northern Italy are equipped.

Of course, on a short line with heavy traffic and frequent stops, like that of the Rome-Ostia Railway, direct current possesses notable advantages, but these conditions do not apply on the Federal State Railways electrification



The wide platforms at the Rome terminal facilitate the rapid loading and discharge of crowds of passengers

Digitized by Google

from Naples east to the Adriatic, for which 3,000 volts d.c. will be used. Incidentally, it may be added that Italy has now a 4,000-volt d.c. line, though it is a comparatively short road and not a part of the Federal State Railways. It runs between Turin and Lanzo and is owned by a private company. The two motors on each truck are each designed to operate under 2,000 volts and are permanently coupled in series.

Most of the three-phase electrification, of which there is a great deal in Italy, especially around Genoa and Milan, uses 3,700 volts on the trolley wire and is at 15 cycles, though on some lines 45-cycle equipment has been installed to get a more ordinary frequency. The railway department purchases about one-third of the electrical energy it uses and its tendency now seems to be rather to purchase than generate more power.

The decision to use high-tension direct current for future electrification south of Florence was reached some time ago as the result of a special government inquiry, and the section from Benevento to Foggia of the Naples-Eastern line is the first to be so equipped. The locomotives for this line are now being built. Some of the objections to the three-phase equipment which led to the decision in favor of direct current are said to be the high maintenance cost of three-phase equipment, owing to the small air gap required in the motors; difficulties in increasing very much the voltage in the contact wires over that at present in use because of trouble at switches and cross-overs, and complications in the control connections if an effort is made to provide more than two running speeds for the locomotives.

Prizes Awarded for Essays on Service Due the Passenger

By Frank L. Butler
Vice-President Georgia Power Company, Atlanta, Ga.

On the street cars in Atlanta there are some 900 trainmen, each a representative of the company. Recognizing the power for good will, or the opposite, which lies in the countless personal contacts of the trainmen with the public, in January the management asked the question "What Service Do We Owe a Passenger for His Fare?" of every man on the cars and buses of the Georgia Power Company. A written answer was requested, and prizes were awarded for the best thirteen replies: First prize $10, second prize $5, third prize $3, and ten prizes of $1 each. Conditions of the contest allowed three weeks for submitting replies and stated that the judges would consider ideas only, giving no weight to spelling, composition, neatness or literary style in arriving at their decision. It was not expected that a large percentage of the trainmen would submit answers in writing, but it was believed that many who did not would give some thought to the subject and be benefited accordingly, for a man cannot devote even one hour of intelligent thought to his job and not be a better workman therefor.

When the contest closed, however, approximately twice as many answers had been submitted as had been expected, and the quality of many indicated much thought in their preparation. Discussions overheard among the men bore out the belief that the question would be productive of thought whether or not a written answer was turned in. A monthly safety dinner attended by the prize winners, as well as by 80 other trainmen who had excellent accident records during the preceding month, was the occasion for announcing the decisions of the judges. First prize was awarded to Conductor W. C. Alsobrook, second prize to Conductor C. H. Vaughn and third prize to Conductor S. J. Steele. In making the presentations, one of the judges read a paper which was a composite reply based on all of the answers. An abstract follows:

What Service Do We Owe a Passenger for His Fare?

Service we owe a passenger begins before a car leaves the barn, by our examination of it. The sign "Car Stop" is an invitation to the public to patronize our business. The signs on the cars should be distinct, well painted, and properly set. We should never run off and leave a person who is making an effort to reach the car, if there is an opportunity afforded, within reason, to pick him up. He might wish to catch a train or have some urgent business at his destination, so as to cause him serious trouble if he misses the car.

We should call out the routes and destinations as passengers board our cars, especially in the center of the city where several lines use the same tracks. This should be done because some people cannot read English, some cannot read at all, some are near-sighted, some half blind, some totally so, some are absent-minded, and some are half-distracted from dodging automobiles.

The most important thing which we owe a passenger for his fare, first and above all, is safe transportation—safety in boarding, safety in being transported and safety in alighting. Make sure that all passengers are on or off before closing the door or starting the car. Try to prevent them from boarding or leaving moving cars, and caution them of the danger of foolhardy acts. We owe them smooth starting and stopping of cars, feeding the current correctly so as not to jerk the passengers. Don't enter curves too fast so as to throw passengers off their seats. We owe them safe operation of the car in relation to other vehicles, with special care at street crossings, for if the car collides with another vehicle, passengers may be hurt, and in any event they will be delayed. Flag railway crossings properly. Stop clear of excavations, thus affording a safe place to alight. Don't make a passenger step off in mud or water, if the stop can be made a few feet away. Assist infirm or crippled passengers not only off the car but over to the curb, thus holding back auto traffic by not starting the car.

Don't let passengers sit in the windows or put their arms out, and keep them off the controller stands. See to it that aisles and platforms are kept clear of obstructions, such as tool boxes, clothes baskets, etc.

We owe a passenger comfort, which includes proper ventilation, with heat in cold weather. Cars should be properly lighted. Always have the seats turned the right way. When necessary, rearrange the seating of white and colored passengers, so as to give every one a seat if possible.

We owe a passenger courtesy. Let us be sure we understand just what courtesy is. True courtesy comes from the heart and promotes good will for the company on the part of the traveling public. Courtesy does not mean that you have to greet every passenger as a long lost brother, or bubble over with joy just because he is allowing us to give him 10 cents worth of service for 7 cents. We should give him a welcoming smile, thank him for the fare paid, give him the largest denomination of change out of coin or bill tendered, unless otherwise specified, and offer to sell him tickets and punch his transfer promptly. Answer politely all questions pertaining to the business of transportation. In order to do this intelligently, we should be well posted as to the system and the city. Give special attention to strangers, as they are unfamiliar with the locations, for if we do this, they will go away with a favorable impression of both the city and the company. Explain blockades and rerouting when called upon. Use patience and show appreciation of patronage, as this is a part of good salesmanship. Give assistance to those who need it, such as little children, the old, lame, feeble or blind.

We owe a passenger accuracy, attention, alertness, vigilance and dependability. We should be sure to punch his transfer properly so as to cause no embarrassment when the transfer is presented to the other conductor or operator.

We owe a passenger service that is safe and dependable at all times, rendered in a courteous manner by neat trainmen, in cars operated smoothly, rapidly and safely. We owe it to him to be thoroughly familiar with the company's rules, and to use common sense, good judgment and play safe. We owe it to him to be careful, capable, efficient, sober and trained to give service as nearly perfect as is humanly possible. We owe a passenger satisfaction because he is our customer. The service we owe a passenger for his fare might be summed up in the Golden Rule: "Do unto others as you would have them do unto you."

Company Consults Its Patrons on Modern Car Design

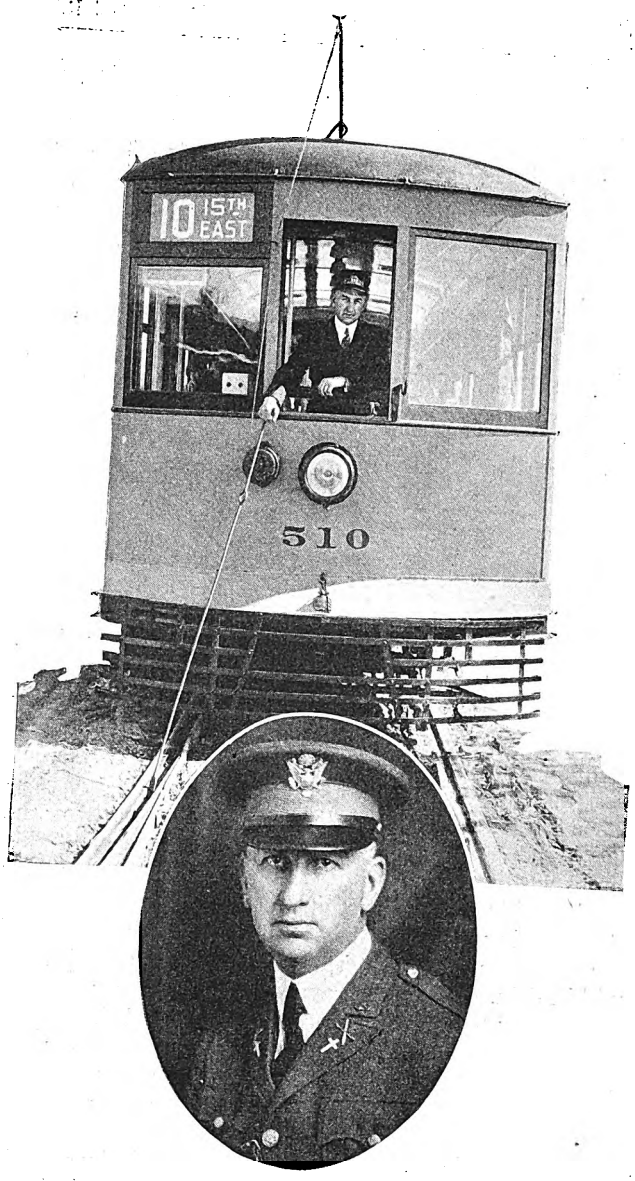
By F. D. Heiges
Office Engineer Utah Light & Traction Company,
Salt Lake City, Utah

Utah Light & Traction Company's co-partnership with the public insures popular transportation in the City of the Saints

SPURRED by a desire completely to rehabilitate its rolling stock to meet the demands of modern patronage and at the same time effect such reconditioning at an expenditure within its means, the Utah Light & Traction Company, Salt Lake City, Utah, called in the public as a consultant. The net result—the issue was successfully met by placing an order for ten new car bodies and five trailer bodies and fitting them in the company's shops with carefully overhauled motors and trucks from existing equipment, all of which was accomplished at a cost of approximately $6,000 per unit. As a fitting climax to this co-partnership, Salt Lake City witnessed a street car parade unique in its annals, and the forerunner of a new era in its local transportation.

It having first been decided that the public should have a hand in the modernization program, an "840 class" car (approximately 40 ft. x 8 ft. 5 in.) was remodeled to conform with the company's idea of a modern street car. This unit was then operated for several months, changes and alterations being made as the need for them developed and in accordance with suggestions obtained from passengers. The result of this procedure placed the management in a position to select those features of design and equipment which proved to be most desirable and also revealed that such replacement was less expensive than rebuilding and much more satisfactory from the standpoint of the company and, what was more important, its patrons' tastes. That the company's judgment was sound is attested to by the public's reaction, of which mention is made further on in this article.

With the receipt of the new bodies from the American Car Company, St. Louis, Mo., the modernization program has followed these lines: The Westinghouse 101-B motors that are being used under the car bodies have been carefully overhauled and thoroughly cleaned. Housings have been rebored and armatures rewound. Trucks have been redesigned by removing superfluous parts, revising and improving brake equipment and lightening in other ways. These changes and improvements furnish trucks and motors that will keep the new cars in operation continuously except for periodic inspection and cleaning.



The Mayor "motorman" on one of the new cars

During a parade of the rehabilitated equipment Mayor Clarence C. Neslin operated one of the units on its maiden trip through the business district, successfully negotiating the heavy traffic and brief frequent stops that were necessary.

In the oval his Honor is shown in a different rôle. Salt Lake City's chief executive when he was chaplain of the 145th Field Artillery, during the late World War.

Next, all equipment, such as seats, glass, electrical equipment, controllers, gongs, trolley and base, heaters, headlights, air equipment, signs, fenders and sanders that had been taken from the old cars and which could be used, was thoroughly renewed before installing on the new bodies. All equipment that could not be used, either because of its obsolescence or unadaptability, was discarded. New Hale & Kilburn light-weight seat frames and pedestals support cushions taken from old seats from which the rattan has been removed with the exception of the back of the vertical cushions. Nickel seat handles have replaced the bronze pattern of the old equipment. Seat cushions and the front of the vertical cushions are upholstered in genuine taxi brown hand-buffed and pebbled leather. This color combination of leather and rattan is pleasing and desirable. It is only when one occupies a position in the rear of the car that the rattan is visible—from the front of the car one receives the impression of seats entirely upholstered in leather—the

Motor car equipped with 60-hp. air-cooled GE-275 motors for hauling trailers

result being a uniform appearance of the car from either end.

Latest type rear-exit electro-pneumatic treadle equipment is being installed and each car is fitted with an illuminated combination route number and destination sign and an Oskelite stop light on the rear. A rich-toned brown glass was used in the upper sash of the side windows in place of curtains. One row of nine lamps with attractive shades has been placed in the center of the ceiling and battleship linoleum laid on the floor. By covering the felt that goes between the floor and the linoleum with waterproof paste on both sides to within 4 in. of the edge, applying waterproof cement to this border to insure thorough adhesion, and then laying and thoroughly rolling the linoleum, the company has obtained a smooth, finished and serviceable floor covering.

The cars are also equipped with Schechter window post casings, which permit raising the window to any height desired. All wiring for the cars is in conduit, terminating on the platform in switch boxes, all plainly marked. Air pipes and other accessories heretofore located under the vestibule roof or inclosed in a cabinet back of the operator's seat are installed within the area partitioned off for the operator, so that they are not visible to occupants of the car. White enameled headlining extending throughout the car gives a uniformly finished appearance. Thermostatically controlled heaters that cut in at 53 deg. and out at 55 deg. are located alongside the body of the car just off the floor between each seat. There is also a plug to which the operator can attach his portable heater.

For single-end operation the cars are arranged with double doors at the front and single at rear. The approximate length and width over all of the cars is 40 ft. x 8 ft. 5 in. respectively. They seat 48 people, eight of whom can be accommodated on a circular lounge seat at the rear end of the car. The step heights from the ground to the first step and to the floor of the car each are 14 in. The total weight of each unit is approxi-

PRINCIPAL SPECIFICATIONS OF THE REHABILITATED UNITS

Name of railway	Utah Light & Traction Company
City and state	Salt Lake City, Utah
Number of units	10
Type of unit, one-man, motor, passenger, city, single end, double truck	
Number of seats, plus one end seat (lounge)	20
Builder of car body	American Car Company
City and state	St. Louis, Mo.
Date of order	11-16-26
Date of delivery	4-1-27; 4-14-27
Weights:	
Car body	10,250 lb.
Trucks	20,060 lb.
Equipment	6,611 lb.
Total	36,921 lb.
Bolster centers	15 ft. 8 in.
Length over all	40 ft. 0 in.
Length over body posts	27 ft. 6¼ in.
Truck wheelbase	4 ft. 6 in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	10 ft. 0 in.
Window post spacing	31¼ in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse, P.V. valve, straight air
Armature bearings	Plain brass
Axles	4½ in.
Car signal system	Consolidated interrupter unit
Compressors	Westinghouse A-4
Conduit	Flexible loom
Control	General Electric K-35-JJ
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Cleveland
Finish	Duco
Floor covering	¼-in. battleship Congoleum
Gears and pinions	Tool Steel
Glass	Libby Owen D.S.B.
Hand brakes	Pittsburgh No. 35 drop handle
Heaters	Consolidated Car Heating Company
Headlights	9-in. Golden Glow
Headlining	¼-in. Agasote
Interior trim	Statuary bronze
Journal bearings	Plain 4 in. x 7 in.
Journal boxes	3½ in. x 7 in.
Lamp fixtures	Electric Service Supplies, safety car

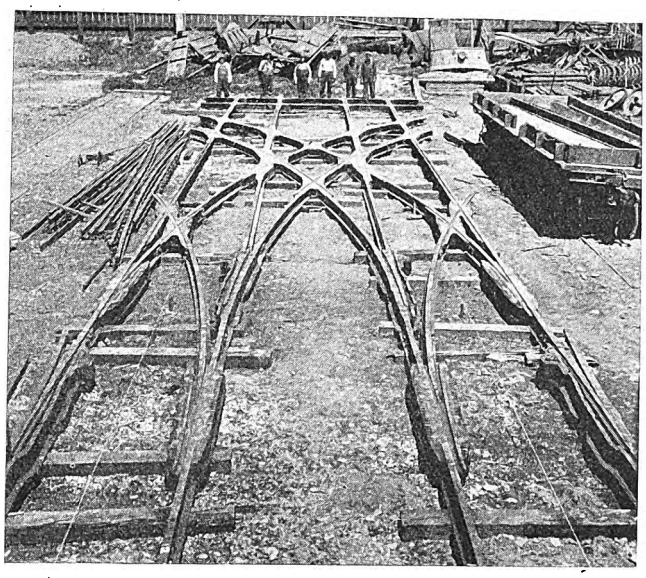
under-rigging black, is the color scheme for the exterior of the cars.

The trailer bodies were received from the factory fully equipped, with the exception of glass in the lower sash, and placed on trucks which were remodeled, considerably lightened, and equipped with 26-in. wheels. This work was done in the company's shops. The seating capacity of these center entrance-exit cars is 56 passengers each. They also are of the arch roof type with ten Brill standard exhaust ventilators. Battleship linoleum, new Brill leather-upholstered seats, complete with 8-in. semi-circular lounges seating six persons in each end, aluminum grab handles, combination hand and air-operated doors, No. 10 Tomlinson couplers, brown colored glass in upper sash, Schechter window post casings and Oskelite stop signal light system on rear comprise the equipment of these units, which are 40 ft. 9 in. x 8 ft. 4 in. Exterior and interior trimming are the same for the trail cars as for the motor cars, except that the monogram is omitted from the side panels. These trailers will be hauled by the "720 series" single-end treadle cars equipped with GE-275 60-hp. air-cooled motors mounted on St. Louis trucks equipped with 28-in. wheels, and they will be used on heavy-duty lines during peak hours.



One half of chrome-nickel special work that will be used at one of the busy intersections of Main Street, forming a part of the company's new plan for reconstructing track and roadway

Parade Introduces New Cars

As an evidence of the public's interest and appreciation, Clarence C. Neslen, Mayor of Salt Lake City, consented to pilot one of the new cars on its maiden trip through the business district when the company on Saturday, April 30, staged a thirteen-car parade. This pageant of old and new transportation was headed by a rebuilt electric locomotive (described in the April 15 issue of the JOURNAL) hauling two flat cars—one carrying the trainmen's band, the other a relic of bygone days, an old horse car; the latter followed by other passenger equipment in the order of its modernness, and a "720 class" car with new trailer and the new motor car bringing up the rear. Invitations were sent to the city commissioners, members of the Public Utility Commission, manufacturers' agents and others inviting them to inspect the new cars at the carhouse beforehand and to participate in the parade as passengers. As a further attraction a trainman attired in the garb of an early day "muleskinner" occupied the old horse car, and girls from the offices of the company and members of the company's ball team rode in the other cars. Following the parade the official party was conducted to the Newhouse Hotel, where luncheon was served.

Among the speakers on this occasion were E. O. Howard, president of the company, who as toastmaster called upon Mayor Neslen; T. E. McKay, Commissioner of the Public Utilities Commission; Julian Bamberger, president of the Bamberger Electric Railroad Company, and D. Morris Young, who, incidentally, drove a horse car in Salt Lake City in 1875. Mr. Young is the son of the late Brigham Young, Mormon pioneer leader. Both the Mayor and Commissioner McKay officially expressed their appreciation of the company's efforts to improve track, rolling stock and service, all of which is indicative of the fair and co-operative attitude and warm relations that exist between public officials and the street railway interests in Salt Lake City.

Incidentally, another phase of the company's rehabilitation program dealing with the right-of-way reconstruction and repairs, requiring an expenditure of $350,000 this year alone, was outlined by Mr. Howard. The various locations in the city and nature of the work in progress were described. Reconstruction, welding joints, inclosing track in pavement or repairing pavement are

now under way on about 6 miles of the track of the system, some 14 miles having been worked over last year.

On the job completed last year and under way this season Elastite was used between the rails and the abutting street surface to decrease the effect of frost action. This is made to fit snugly against the web of the rail, and as a result of its contraction and expansion qualities water seepage and freezing are reduced to a minimum. Locally manufactured concrete slabs 1 ft. x 4 ft. x 3¾ in. are used alongside the Elastite opposite the rail on practically all pavement repair jobs. They have proved very satisfactory not only because their weight prevents their being kicked out of place when loosened but also because they do not chip readily and can be reset at small expense. In addition to the concrete slab and Elastite, the company is using on all reconstruction jobs this year the ties of the Dayton Mechanical Tie Company and the International Steel Tie Company. Later in the summer the company plans to open up one of the downtown sections and to replace the special work with the chrome-nickel-steel layout shown in the accompanying illustration and to inclose the rails and resurface the intersections with concrete. The following summer another intersection will be opened, and so on until those over which operation is most frequent are replaced and resurfaced.

Another Safety Slogan Contest in Rochester

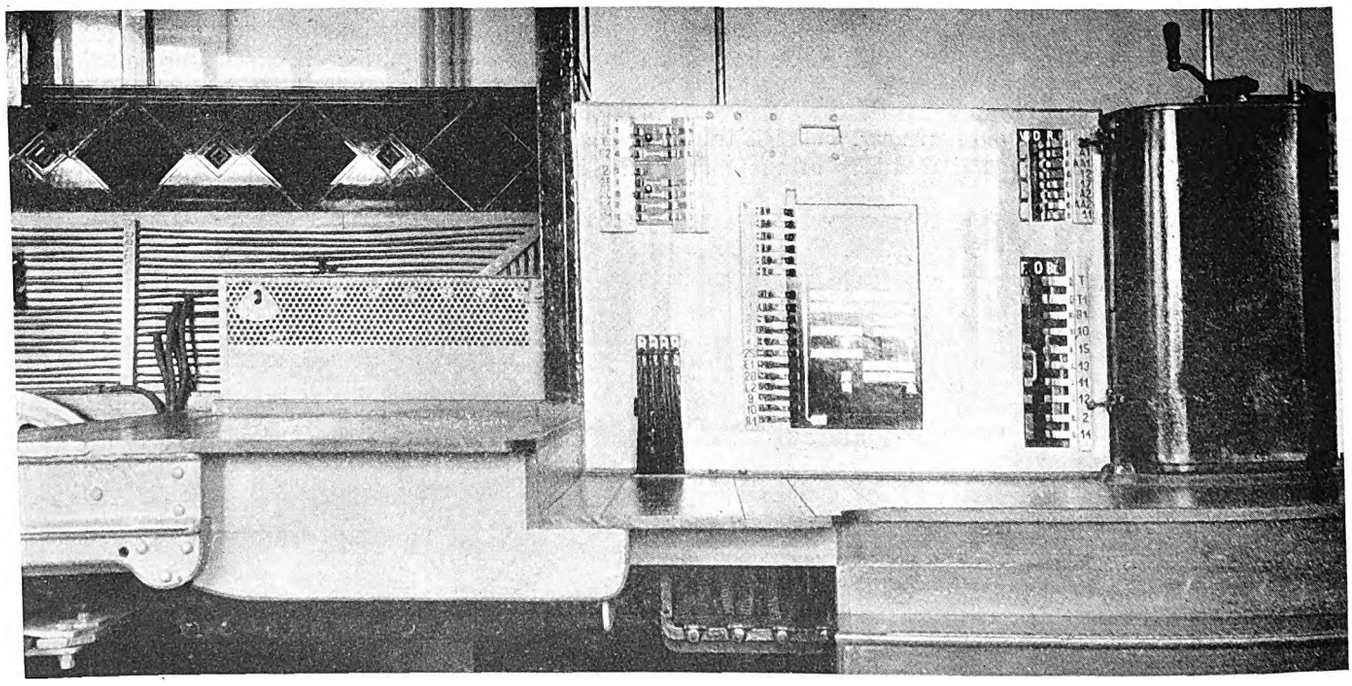
CASH awards of $40 are again being offered by the Rochester Safety Council, Rochester, N. Y., to citizens who can write safety slogans. Four slogans are needed and for the four best selected by the Safety Council separate prizes of $10 each will be awarded. The slogans, which must not exceed seven words, are to be used on street bulletin boards in 65 communities in the United States. Any person may submit as many slogans as he or she wishes. The Rochester second annual safety slogan contest will end officially on Sept. 30.

Last year the Rochester Safety Council received 461 slogans. This time the four months of January, February, March and April, 1928, have been selected as Rochester's months. During the first quarter of the next year the slogans selected will be sent throughout the United States, as was the case this year, when Rochester chose slogans for the entire country to be used during May, June, July and August.

Developed Controller for Schoolrooms

STUDENT motormen of the Hamburg Surface Lines, Hamburg, Germany, are trained in a well-equipped schoolroom. A novel method is used for illustrating the controller connections. Usually the student has to learn these from looking at a diagram or from inspection of the cylindrical controller itself. In Hamburg, however, the developed periphery of the controller cylinder has been reproduced on a sheet of black canvas with the segments painted on it in bright yellow paint. The reversing cylinder and braking cylinder have been treated in a similar way, and all have been mounted so as to move horizontally in a large wooden frame. At the sides of each opening are representations of the controller fingers, which are numbered in the proper order, as seen in the illustration.

As the handle of the adjoining real controller is turned forward the representation of the controller surface moves from right to left, and it moves in the reverse direction when the controller is turned off. It has been found that as these connections are on a flat surface the student follows them much more easily than if he had to get his only idea of them from a controller cylinder. The company also has a well-equipped schoolroom for its student bus operators.



Controller connections have been developed on a plane surface, mounted in a frame, for the benefit of student motormen on the Hamburg Surface Lines

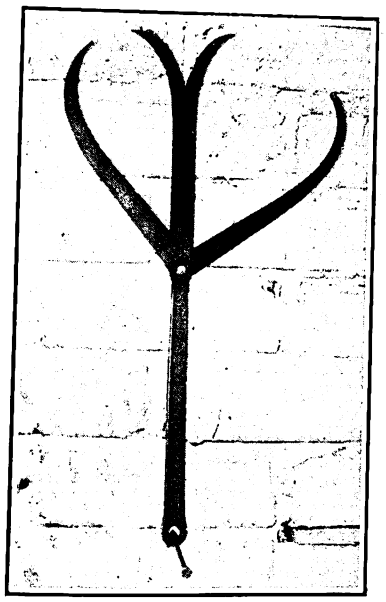
ROLLING STOCK—MACHINE SHOP—2

Convenient Form of Double Calipers

FREQUENTLY it is necessary for a shop man to measure two different sizes in connection with machining operations to secure an accurate fit. Common cases of this are the two axle diameters for axle bearing fits, journal bearing diameters and the two armature bearing diameters. For such conditions machinists in the shops of the Grand Rapids Railway, Grand Rapids, Mich., have found it convenient to use a double caliper of the type illustrated. With this it is unnecessary to lay down one set of calipers and take up another in order to measure two different diameters.



Form of double caliper used in the shops of the Grand Rapids Railway

The double calipers consist of a single center section with the bottom split and bent out so as to form the stationary jaws. To this center section are riveted two movable arms arranged to line up with the stationary points. Through the use of this type of double caliper much time is saved in machining operations.

Lifting Buggy Is Handy for Moving Motors

CAR motors are transported from place to place in the Grand Avenue shops of the Connecticut Company with increased facility by the use of a three-wheel buggy equipped with its own lifting device. The apparatus was designed by J. E. Dooley, master mechanic, and built in the railway shops. The end of the buggy is rectangular with two 3½-in.x3½-in.x⅝-in. angles for uprights and a 4-in.x½-in. steel member across the top. Each upright has at its lower end a 10-in. wheel mounted on a 1½-in. axle. The two sides of the apparatus, each having the general shape of a quarter circle, join at the bottom, where a third wheel is located. A handle for pulling the truck is attached to the axle of this wheel.

Over-all height of the buggy is 48 in. Its width is 43 in. and its length is 35 in.

A lever arrangement with hook and chain is employed to lift and carry the motor. The fulcrum of this lever is a horizontal member parallel to the top member of the end frame. Chains pass through the hoist loops of the motor frame and over a hook on the short, or 5-in. arm of the lever. The other arm, including a sleeve, is 50 in. long, making the lever ratio ten to one. Hence two men having a combined weight of about 300 lb. can raise a motor weighing 3,000 lb. After the motor has been raised clear of the ground, a pin is inserted above lever arm. Pressure can then be released on the long arm while the motor remains suspended.

Spring-Collet Chucks Center Work Quickly

FOR holding bar stock or any other cylindrical material different sizes of spring-collet chucks are used in the 39th Street repair shop of the Brooklyn-Manhattan Transit Corporation. An accompanying illustration shows a number of these. The three parts of a large chuck are shown in the background of this illustration and the body portion at the left. This is provided with a female thread at one end which screws on to the lathe spindle. The second part, shown in the center, slides into the body portion and has slots to provide a spring clamping action. The end of this second section and the third part have corresponding tapers which bear on each other when the two parts are screwed together, so that they press firmly and hold the material to be machined. This action provides a perfectly central position for the work and thus makes unnecessary any truing or adjusting.

To accommodate different sizes of stock these collet chucks are made up in sizes varying by $\frac{1}{8}$ in. from 3 in. to $1\frac{1}{4}$ in. In the front part of the accompanying illustration will be seen seven of the No. 2 parts of the chuck, all of which fit into the same master body and are clamped with the same master end piece. These two parts are shown at the left. The use of these spring-collet chucks saves much time on jobs that would otherwise be very expensive.

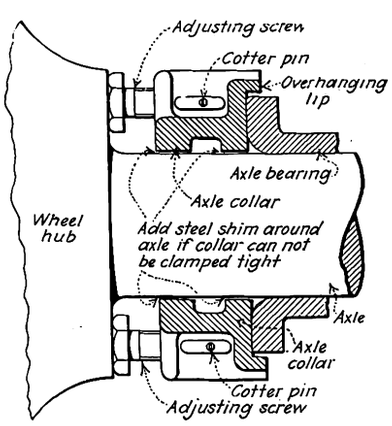
Preventing Breakage of Axle Collar Adjusting Bolts

By P. A. Pontius
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

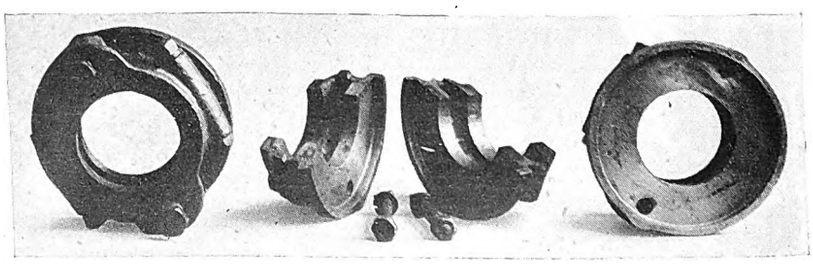
BREAKAGE of adjusting bolts on axle collars can be overcome easily by keeping the axle collars tight around the axle. The axle collar should revolve simultaneously with the axle and wheel hub. This will prevent all twisting strain on the bolts and they will be under compression strain only if sufficient attention is paid to this point. Loose axle collars can be found readily by checking if the heads of the adjusting bolts have wiped the dirt off the wheel hub.

Sheet steel shims should be placed around the axle in case the diameter of the axle is too small. Shims should also be used if the bore of the collar is oversize such that the collar cannot be clamped tight to the axle. Cardboard paper, sandpaper or other compressive materials or soft metals should not be used.

Axle collars are received from the factory with shims in the split; that is, between the two halves. These shims should be removed before clamping the collar around the axle in order to insure a tight fit on a standard size axle.



The space between the wheel hub and the heavy flange should be filled by the collar



Shims should be removed from the split before clamping

Association Activities

Southern Equipment Meeting Attracts Wide Attention

Executives and maintenance men from properties outside the southern territory attended Atlanta meeting. As result of good work being done, membership has grown to nineteen properties.

SUBJECTS covering almost the entire range of electric railway equipment maintenance crowded a three-day session of the Electric Railway Association of Equipment Men, Southern Properties, held in Atlanta, July 27, 28 and 29. This was the twelfth semi-annual meeting of the association, which in a period of six years has grown in membership from four to nineteen properties. Attendance during the meetings numbered approximately 200 and included representatives from Pittsburgh, Baltimore, Cincinnati, St. Louis and other cities beyond the limits of the southern territory in which the association was originally organized. In addition to equipment maintenance men, there were present a number of executives who were attracted by the wide scope of the program and the lively discussion of subjects vital to the prosperity and progress of the industry.

W. S. Arkwright Makes Address

The high spot of the meeting was marked by an address at the dinner on Thursday evening, made by W. S. Arkwright, president Georgia Power Company. "Maintenance men in the electric railway industry have had serious limitations both in their conception of their jobs and in their performance," he said, "but the primary responsibility for past and present shortcomings lies not with them; it rests on the shoulders of those who control the policies of electric railway properties; those charged with the financial and management responsibility, who have dictated the conditions under which the maintenance man has been required to function.

"In a period of 25 years we electric railway executives have made every mistake that it was possible to make in the management of a transportation business. The troubles of the industry are our fault and not that of the public. We started out to run a cheap business and we conducted it as such. The rate of pay for our men was the lowest in town and the hours of work were the longest. A job on the platform of a street car was the last job in town.

"In those days the fare was 5 cents. The cars were cheap little vehicles running on a light strap of iron in the street. The floor was covered with straw to keep passengers' feet from freezing. It was a cheap service rendered by cheap men in cheap cars—and it didn't go very far. Since that time we have extended the service enormously. We have increased the size of cars and at the same time every element of cost both in operation and maintenance has increased many fold. But we have attempted to keep the service cheap. We have attempted to meet the rising cost of operation by parsimonious economies. We have failed entirely to do our part in frankly meeting changed conditions by keeping our service in tune with the times and by giving our public an opportunity to buy at a fair price the kind of service they are entitled to have and are willing to pay for, once they are given a fair opportunity of understanding the situation and expressing their preferences."

Vicious Cycle Started

Mr. Arkwright went on to point out how the vicious cycle of deferring maintenance and of letting equipment and service deteriorate was established as revenues began to fall off with the coming of the automobile. He painted a vivid picture of the situation which was permitted to grow as deteriorated service and the attractiveness of the automobile formed a cumulative cycle which took more and more people off the street cars. Only two or three years ago, he explained, did the industry begin to wake up. Only then did it begin to pay some attention to the relation between the character of its cars and revenues which could be expected. Only recently has it begun to substitute intelligent action for excuses. "Today," he said, "we're beginning to make our business one not to be ashamed of. We're beginning to make it one that we've got a right to be fairly paid for. Even when we seriously started to adjust our fares to meet the changed operating costs of today, we took ten bites at the cherry instead of one—we went at it one-half of a cent at a time. The salvation of the electric railways lies in first providing a decent service that will meet the requirements of present-day conditions, and then openly asking a fair price for that service which will enable us to keep it up to date. Our cars ought to be better each year, and our fares should be on a basis that will permit us to offer the public the benefit of the improvements from year to year that may be expected in car design and equipment."

Papers Cover Many Topics

The collection and analysis of service data for making railway motor applications was the subject of a paper by A. J. Naquin, engineer of rolling stock and shops New Orleans Public Service, Inc. T. E. Alderdice, superintendent of maintenance Pittsburgh Railways, outlined the methods used on that property for establishing car maintenance on a production basis. D. F. Smith of the railway motor equipment division General Electric Company discussed some of the difficulties encountered in railway motor design and manufacture. A talk on the application of worm drive axles to electric railway cars, illustrated with lantern slides, was made by N. R. Brownyer, engineer railway department Timken Detroit Axle Company. The abc.'s of good equipment maintenance practice were covered in a paper by J. S. Dean, renewal parts engineer Westinghouse Electric & Manufacturing Company. The mechanical department's part in building good public relations was portrayed in a paper by C. J. Crampton, manager of public relations, Dallas Railway & Terminal Company. Two papers were delivered on the general subject of car cleaning and painting; one by D. H. Bell, supervisor of overhaul Pittsburgh Railways, discussed the use of lacquer finish for street cars. The other by L. A. Sargent, master mechanic Tampa Elec-

tric Company, presented the experience of that property in the use of wax as a protective coating for the exterior of cars. Some of the troubles encountered in the maintenance of safety car equipment were outlined by J. R. Troutman, foreman Knoxville Power & Light Company.

Lively Discussion on Question Box

In addition to the prepared papers on the program, frank discussion of some 28 maintenance questions that had been sent in by members furnished the basis for a very lively discussion, which is one of the features of this association's meetings. Inspection trips were also made to the various properties of the Georgia Power Company. One evening trip was made to the car shop to inspect the unusually brilliant artificial illumination which is provided there. An abstract of the paper by Mr. Sargent is published elsewhere in this issue. Those by Messrs. Bell and Alderdice will be published next week.

Mr. Naquin's paper on the collection and compilation of service data for making railway motor applications was illustrated with forms and diagrams to show the method used by the New Orleans company for putting this data in form available for use. The importance of accurate service data for the proper application of motor equipment was stressed. The speaker also pointed out the usefulness of such data in making and checking operating schedules. A word of caution was sounded against accepting only the thermal and energy consumption characteristics of a motor in determining its suitability for a given class of service. The physical aspects, such as size of bearings and proper clearances, were considered equally important in selecting motor equipment.

Operating companies were urged to provide the necessary training for one or more men so as to fit them for intelligent co-operation in the selection of motor equipment. The speaker said that the electrical manufacturing companies show a keen desire to co-operate fully with an operating company in checking the suitability of motor equipment for specific kinds of service.

In the discussion of this subject, J. C. Thirlwall of the General Electric Company, called attention to the tendency toward a more conservative thermal rating for modern light-weight, high-speed, ventilated motors, in comparison with the heavier, slower speed, unventilated machines formerly used. The demand for increased rates of acceleration and the severity of modern schedule requirements under congested traffic conditions, combined with the tendency toward light weight and high speed, have brought about a situation in which mechanical limitations largely determine motor applications. Under these conditions thermal rating becomes a secondary rather than a primary consideration, according to Mr. Thirlwall. The most important limiting factors in present-day motor selections are ability to commutate at the rates of acceleration required, and mechanical limitations.

Modern Design Increases Manufacturing Difficulty

In his paper on problems encountered in the manufacture of electric railway motors, D. F. Smith of the General Electric Company said that the outstanding difference between the service to which a railway motor is applied and that of other types of electric motors is vibration. Due to being mounted rigidly on the axles, these motors get direct blows and shocks attributable to irregularities in the rails. Added to these is the constant high frequency vibration set up by the gearing. The combination of these destructive forces is the indirect cause of a great majority of motor failures, according to the speaker. Frames crack, caps loosen, bearings fail, coils loosen, leads break, cables become grounded, brush-holders loosen and lock washers refuse to hold. The limtations that exist as to permissible size and weight offer an obstacle to overcoming all of these troubles.

After enumerating a number of the difficulties encountered in motor design and manufacture, Mr. Smith said that the manufacturers are making an effort to produce a motor that will meet the service requirements imposed by modern conditions. Regarding the maintenance of this equipment, he suggested that the manufacturer's first request is periodic inspection with the correction of small troubles before serious abuse of the motor has occurred. According to the speaker, the most important maintenance operation which eliminates trouble is the tightening of loose parts. This applies as well to the winding, both field and armature, as to the various bolts and nuts.

Worm Drive Axle Progress Outlined

In his address on the development of worm drive axles for electric railway cars, N. R. Brownyer of the Timken Detroit Axle Company explained that gears are usually the worst offenders, so far as noise is concerned, on a moving vehicle like a street car. The inherent silence of worm gearing therefore offered one of its outstanding advantages for street car propulsion. The speaker said that worm gearing is not only silent when operating under even torque, but is free from the knocking that is so common in other forms of gearing due to torque reversal. He explained that the worm gear, regardless of tooth back lash, does not tend to chatter or knock. This was attributed to the large areas of contact, low resonant quality of the worm wheel material and obliquity of the two contacts resulting from the use of high lead angles.

The present day worm-drive axle for automotive vehicles, Mr. Brownyer explained, with its one piece oil tight and dust proof housing, is a product of years of experience and patient analysis. With this experimental and research background it was decided to adapt the principles thus developed in the automotive field to the electric railway field, with such changes in proportion as were necessary to insure successful operation on steel rails. Unlike all other forms of gearing, a worm gear set becomes more efficient in use, according to the speaker. The chief reason advanced for this is that the worm wheel is generated by a cutter that is the shape of the worm itself. Consequently when the hardened, ground and polished surfaces of the worm teeth make contact with the special alloy bronze worm wheel teeth, a continuation of the generating process is carried on. In other words, any minute errors in cutting the teeth of the worm wheels are gradually corrected as the gearing grows older in service.

In the discussion of slides illustrating the construction of the axles and trucks used on the experimental cars for the Chicago & Joliet Electric Railway and the Springfield Street Railway, Mr. Brownyer predicted that the internal form of expanding brake applied on these axles would give a splendid account of itself in electric railway service. He based this on the low adhesion of steel wheels to the rail and the comparatively low weight carried on each axle in comparison with heavy duty automotive vehicles. In addition, he explained that the use of small wheels and large brake diameters produce a combination of conditions much less severe than that encountered on motor buses. Regarding the use of a differential in the axle, the speaker predicted that it would tend to eliminate the noise produced on curves from slipping wheels. He also said that the manufacturer expected that the use of a differential would result in decreased flange wear and track wear on sharp city curves.

A number of slides were shown to illustrate the general features of the axle and truck construction used on the experimental cars. In answer to questions, Mr. Brownyer explained that the worm design permitted the use of gear reductions as high as 12 to 1 without producing lead angles which would interfere with the free coasting of cars. Regarding the relative efficiency of worm gearing and spur gearing sets throughout their entire life, he said that there was apparently little difference in the net result and that exhaustive tests on several high grade automobiles had shown efficiencies very slightly in favor of the worm drive. According to the speaker, axles of this type have been designed for cars having a total weight of 40,000 lb. Removal of the motors from the axle and the consequent feasibility of increasing the motor speed and reducing size and weight materially were held to be major advantages of the worm drive construction.

Under the title of "The abc's of Equipment Maintenance," J. F. Dean, renewal parts engineer Westinghouse Electric & Manufacturing Company, presented an exhaustive review of the best modern maintenance practices as compiled from the experience of a great many operating properties over a wide

Digitized by Google

range of conditions. Since Mr. Dean's paper was too long to be read in its entirety, he presented in outline only some of the high spots of improved maintenance practice contained in the paper. It was suggested by President W. H. McAloney that each member take this paper home for discussion with his individual staff and for a guide in analyzing his own practices. Considerable discussion ensued regarding various points mentioned in Mr. Dean's paper, particularly as regards various features of armature and motor maintenance practice.

Maintenance Men Affect Public Opinion

In the absence of C. J. Crampton, manager of public relations Dallas Railway & Terminal Company, his paper on the mechanical department's part in good public relations was presented by H. J. Beadle of Mr. Crampton's company. Emphasis was placed on the fact that all departments of the street railway must function for better public relations if the aggregate effect desired by the property is to be brought about. Since service is the backbone of good public relations, the mechanical department occupies a most important position along with the maintenance of way department, as they both furnish the foundation for good service.

According to the speaker, too much stress cannot be placed on the importance of good equipment well maintained. People are attracted by well-painted, clean cars. The environment produced by the character and condition of the cars on a property attracts or repels patrons. Regarding color combinations, a note of caution was sounded on the use of gaudy circus-like painting schemes. Mr. Crampton held that the human mind questions anything that too far departs from its accustomed standards and that after the novelty has worn off, the public soon tires of the tawdry substitute for ordinary good taste which is represented by extreme color schemes.

One feature of the mechanical department's public relations work was particularly stressed. This referred to the use of the department's personnel to improve public good will for the company. A company is known by its employees, according to Mr. Crampton. If they are good citizens who bear their part of the civic responsibility, are friendly with their neighbors, congenial, helpful and pay their bills promptly, the community clothes their employer, the transportation company, with their characteristics. Employees, he said, must be impressed with their duty of representing their company properly. They must be acquainted with company policies and schooled in its methods, not only as to their particular job but in the larger company relationships. They must feel that they are being treated fairly and are given every opportunity to make the most of their jobs. In summarizing, the speaker said that the cornerstone of public utility success is favorable public opinion, which in turn is gained by good service, pleasingly rendered and by the public's appraisal of individual conduct in public and private affairs.

In the discussion of the subject of car improvement, there was considerable difference of opinion regarding the proper types of painting and the use of de luxe seats in city cars. A. H. Leschke of the Pittsburgh Railways described and discussed the new de luxe car which is being tried out in that city with the seats arranged at an angle of 45 deg. and designed to provide maximum comfort to passengers. Serious attention is being given to this subject as the result of the experience obtained.

A discussion of maintenance problems in the operation of safety cars was presented in the paper by J. R. Troutman, inspection foreman Knoxville Power & Light Company. He emphasized the advantages of the interlock between the doors and the air brakes, pointing out the advantages of this form over the former type of interlock with the controllers. As the result of experience with safety car equipment, the speaker made the following recommendations regarding maintenance practice to insure proper functioning of these devices: Clean strainer air and valves once every six months; completely overhaul all valves, including compressor and governors, every eighteen months; clean compressor and renew oil every six months; clean brake cylinders once a year; inspect all parts of the equipment once a week; check governor rings every three months.

Dry Cleaning Street Cars*

By L. A. Sargent
Master Mechanic Tampa Electric Company

During the past few years electric railway companies have given great thought to the cleanliness and general appearance of street cars, both as to exterior and interior, realizing these to be very important factors, in improving service, promoting better public relations and thereby increasing revenues. To this end a greater effort is being made today than formerly to keep equipment in better condition as regards cleaning, sweeping and painting. There exists among the various companies, however, a wide variance in the methods used to keep the equipment looking clean.

In Tampa we are fortunate in that the soil is not black and sticky, but sandy. The air is not salty. It is inclined to be dry and fogs prevail for only a short time in the early morning during the winter months. Such conditions enable us to maintain a system of car cleaning that is simple to the extreme.

Four years ago in March we tried using Old English floor wax on the exterior of one of our street cars. The effect was astonishing and was the basis of immediate further study in that direction. Before a year passed we had experimented with several other cars, and during 1924 and 1925 we completed the waxing of all of our closed passenger cars. Since then it has been only a matter of routine waxing, catching cars which look dirty and which average about six months between waxings.

We are thoroughly sold on the principle of waxing cars. Its advantages are many, namely, it eliminates washing, more than doubles the life of paint, as well as the life of the car, and is quickly and easily cleaned.

The method of applying the wax is very simple, yet it must be done in a certain manner if good results are to be obtained. The higher the polish desired, the more care must be used in applying the wax. The simple analogy is in shining one's shoes; if the shoes are dirty they must be cleaned before the wax is applied. The same is true of street cars or automobiles; the surface must be cleaned before waxing. Paste wax can be evenly applied by folding some cheesecloth and placing a lump of wax the size of a hen's egg in the center, never letting the raw wax touch the surface being covered. Every inch of surface must be rubbed with wax, otherwise the result will be an uneven polish. After waxing the entire surface, the wax at the starting point will probably be hard enough to start rubbing for the polish. Ordinary cotton waste or soft rags can be used and will take one man from half an hour to one hour to rub a good polish. At first the wax leaves a greasy appearance on the car and it takes several wipings, with dust as the abrasive, to get entirely rid of this greasy effect. Our cars are yellow and do not show grease as plainly as darker finishes or highly polished automobiles and consequently one hour of polishing is usually sufficient.

For a single truck Birney car about ½ lb. of wax is required and for a double-truck car slightly more than 1 lb. Labor varies from two to four hours, according to whether the car has to be washed and dried before applying the wax. On our property only one man is employed to wax and wipe all cars, this labor being all the effort needed to keep the exterior—excepting windows which have to be cleaned with "Bon-Ami"—of our 121 closed passenger cars clean. Our present practice of waxing cars every six months amounts to about one car each workday and gives the man ample time to wax the car well, as well as time to wipe off all other cars which happen to be in the carhouse. It also gives him a little rest between waxings, for it's no boy's job to polish a waxed surface as large as a street car. But when the job is fin-

*Abstract of a paper presented at semi-annual meeting, Electric Railway Association of Equipment Men, Southern Properties, Atlanta, Ga., July 27-29.

Digitized by Google

ished and you realize that the bright and glossy finish is there to stay from six months to a year—depending on the number of times it is wiped—you are proud of the car and the method used and wish that all of the cars were freshly waxed.

All of our wiping is done during the day when the air is dry. Every active car in the carhouse, either on a split-run or as hold-in, is wiped off daily. A check is kept, however, so that any one car will not run over five days without being wiped off. For this work we use a long handle mop, 16 in. wide, with a removable, washable head. With this equipment it requires a man less than two minutes to wipe off a standard single-truck Birney car, going over the entire exterior. If the window guards are screwed or bolted up and have to be undone before they can be dropped it will require longer to do this work. To those who have never rubbed waxed surfaces, the speed of this wiping operation may seem absurd, but is quite reasonable when you consider the part coefficient of friction plays.

For my own information, I have measured the coefficient of friction of enameled and lacquered surfaces before and after waxing. These tests were obtained by pressing a block covered with cheesecloth against the side of the various cars, using a pressure of 20 lb. and pulling the block along with a scale. The coefficients of friction found were as follows: Old Vitralite enamel, not waxed, 0.540; old Vitralite enamel, waxed, 0.344; lacquer surface, not waxed, 0.412; lacquer surface, waxed, 0.275.

These figures show that the effort of wiping an enameled car which has not been waxed is twice as great as that required to wipe a lacquered car which has been waxed. Varnished and enameled cars which have not been waxed do not wipe readily, as the dirt becomes imbedded in the surface and usually requires a washing to be really cleaned.

It is not always necessary to wax the entire surface of the street car, as the parts above the window sills do not get the hard wear the lower parts get and consequently the bottom or body of the car and the front dashes can be cleaned between regular waxings by using a little leptyne and wax on a piece of cotton waste. This removes the dirt and spots and does not injure the wax already on the car, yet adds just enough to make it polish.

Aside from the ease in wiping and the long periods between waxings, one of the outstanding advantages of waxing is the protection given to the paint surface. We know that oxygen in the air is the chief enemy of paint. Wax forms a film over the paint and if this film is maintained the paint cannot suffer except from scratches and bruises. This fact has proved itself in practice, as we are now painting cars on account of scratches and patches and not because the paint itself is worn off or the surface needs paint protection.

Even a greater factor is the elimination of much of the water formerly used on cars for washing.

Wisconsin Association Program

PROGRAM for the annual convention of the Transportation Section of the Wisconsin Utilities Association, to be held at the Hotel Pfister, Milwaukee, Wis., on Aug. 18 and 19, has been announced. The program follows:

Thursday Morning, Aug. 18

Registration at Hotel Pfister.

Address of chairman, Clyde L. Hedges, La Crosse, Wis.

"Speed with Safety at Lower Costs," by E. J. McIlraith, Chicago.

Announcements by Executive Secretary John N. Cadby of the Wisconsin Utilities Association.

"Speed with Safety in Spite of Traffic," by Thomas R. Tate, Milwaukee, Wis.

"Safety of Railway and Bus Operation," by Commissioner A. R. McDonald, Madison, Wis.

Thursday Afternoon

Inspection trips.

Thursday Evening

Annual banquet. Talks by W. H. Sawyer, president American Electric Railway Association, and Cornelius Corcoran, president City Council of Milwaukee.

Friday Morning, Aug. 19

Report on Accident Experience, by R. M. Howard, Winona, Minn.

"Increasing Co-ordination of Car and Bus for Greater Speed with Safety," a series of ten-minute talks by J. H. Lucas, J. R. Blackhall and Henry Cordell on design and F. M. Holaday on operation.

General discussion:

Fellowship report on "Noise Research," by Erwin Summers, University of Wisconsin, Madison.

Election of officers.

"Maintenance of Way Problems," ten-minute talks by E. J. Archambault, F. J. Kramer and A. A. Oldfield.

"Advertising and Selling Transportation," by Fred Eriksen, Milwaukee, Wis.

"Popularizing Safety Among Platform Men," by Chester K. Thomas, Chicago.

American Association News

Nominations for 1928

RECOMMENDATIONS by the nominating committee of names of officers of the American Electric Railway Association for 1928 has been announced as follows:

For President—R. P. Stevens, president Penn-Ohio Edison Company, New York, N. Y.

First Vice-President—J. P. Barnes, president Louisville Railway, Louisville, Ky.

Second Vice-President—Paul Shoup, president Pacific Electric Railway, San Francisco, Cal.

Third Vice-President—J. H. Hanna, president Capital Traction Company, Washington, D. C.

Fourth Vice-President—C. E. Morgan, vice-president and general manager Brooklyn City Railroad, Brooklyn, N. Y.

Treasurer—Barron Collier, president Barron G. Collier, Inc., New York, N. Y.

For operating and manufacturer members of the executive committee at large for the three-year terms expiring 1930:

Operating Members—J. H. Alexander, president Cleveland Railway, Cleveland, Ohio; D. W. Snyder, Jr., vice-president Illinois Traction System, Springfield, Ill.

Manufacturer Members—J. G. Barry, vice-president General Electric Company, Schenectady, N. Y.; W. F. Cutler, vice-president American Brake Shoe & Foundry Company and president Southern Wheel Company, New York, N. Y.; J. R. Fitzpatrick, vice-president Haskelite Manufacturing Corporation, Chicago, Ill.

Twelve Railways Compete for Coffin Award

BRIEFS in competition for the 1927 Charles A. Coffin award were received at American Electric Railway Association headquarters, New York City, from twelve companies on or before Aug. 1. The entrants are as follows:

Birmingham Electric Company, Birmingham, Ala.

El Paso Electric Company, El Paso, Tex.

Northern Texas Traction Company, Fort Worth, Tex.

Georgia Power Company, Atlanta, Ga.

Little Rock Street Railway of the Arkansas Power & Light Company, Little Rock, Ark.

Chicago Surface Lines, Chicago, Ill.

Virginia Electric & Power Company, Richmond, Va.

Grand Rapids Railway, Grand Rapids, Mich.

Southern Colorado Power Company, Pueblo, Col.

United Railways of St. Louis, St. Louis, Mo.

Chicago, South Shore & South Bend Railroad, Chicago, Ill.

Durham Public Service Company, Durham, N. C.

Foreman Conference Registrants

AS THIS issue of the JOURNAL goes to press the following registrations have been received at American Association headquarters for the training course for foreman-conference leaders at Cleveland, Oct. 3 to 8:

Ernest Cox, Chicago North Shore & Milwaukee Railroad.

Homer Free, carhouse foreman Louisville Railway.

Jos. A. Griffin, supervisor Boston Elevated Railway.

Rudolph Kundert, machine-shop foreman Boston Elevated Railway.

James L. Lovitt, director of training and education Philadelphia Rapid Transit Company.

Henry H. Norris, educational adviser Boston Elevated Railway.

W. I. Ray, chief motor inspector Louisville Railway.

A. J. Rowland, educational director Milwaukee Electric Railway & Light Company.

A. J. Sarré, New Orleans Public Service, Inc.

H. W. Saul, educational director Edison Electric Illuminating Company of Boston.

A. C. Stukens, master mechanic Dayton & Western Traction Company.

C. K. Thomas, Chicago, North Shore & Milwaukee Railroad.

The Houston Electric Company will also send a representative and there will be additional representatives from at least two of the companies mentioned above.

News of the Industry

Fare Increase Wanted

Company operating in Baltimore asks for advance to ten cents, with temporary increase effective at once

THE United Railways & Electric Company, Baltimore, has applied to the Maryland Public Service Commission to be permitted to increase the fare to 10 cents flat, with a substantial increase immediately as a temporary emergency pending establishment of the 10-cent rate. The present fare in Baltimore is 7½ cents. It has been in effect since 1924.

In a statement made by Charles D. Emmons, president of the company, it is said that the 10-cent fare would enable the company to earn this year only what has been deemed by the commission as a fair return.

A table of net income filed with the application shows some marked decreases.

NET INCOME OF BALTIMORE COMPANY

	1926	1927	Per Cent Decrease
January	$70,135	$72,128	*2.84
February	27,606	27,590	0.06
March	102,917	81,500	20.80
April	81,049	61,000	24.74
May	104,860	63,529	39.42
June	73,261	41,721	43.05

*Increase.

In asking for the 10-cent rate the company also requests that it be permitted to charge a half fare of 5 cents. The regular 5-cent fare for adults was in effect until 1918 when the rate was increased to 6 cents. In the following year it was raised to 7 cents or two tokens for 13 cents. This rate continued until 1924 when the company was authorized to increase it to two tokens for 15 cents or 8 cents straight. When this action was taken extensions were made in a number of the base-fare zones.

Mr. Emmons said:

Our difficulties grow out of the changing trends in city transportation and traffic. When the long-awaited "saturation point" in the use of automobiles is reached, then the electric railways will find their new service levels. This "saturation point" may not come in Baltimore until so many private automobiles have been poured into the downtown traffic streams that the movement of traffic is slowed down almost to a standstill and the man who has abandoned his street car for a private automobile finds that his automobile is of no use to him any more.

Or it may be dependent upon the automobilist's discovery that he is losing money by giving up the use of street cars. Everyone knows how expensive automobiles are to own and operate, but the fear of expense has not yet redounded to the benefit of general transportation systems. The fact is, of course, a person may take several street car rides for the money he spends to keep an automobile that will be available for a single mile. That fact so far has not sunk home, or it is given little thought.

It may be said that railway service is too slow and uncertain. That unfortunately is a fact today, but it is merely a link in a chain of circumstances.

Back of it are traffic congestion causing untold delays, automobile parking and the decrease in riding, which, as would be the case in any other business, makes necessary a decrease in the output of the railway's product, which is car miles.

The petition filed by the company states that a recent study shows that during the period from 1915 to 1926 the number of passengers carried over long city lines has increased 50 per cent and the total carried over short city lines has decreased slightly. In the same period car miles over the long lines increased 50 per cent and car miles over short city lines have decreased about 9 per cent. The steady drift of the population, it is cited, has been farther and farther away from the center of the city, which, together with zone extensions ordered from time to time by the commission, has made a marked increase in the length of the average ride. The application says:

The cost to your petitioner in the increased length of ride required to be given because of the 1924 zone extensions has been checked against the loss predicted at the 1924 fare hearing, and it is clear that the zone extensions (together with school fares) required by your honorable commission in 1924, are causing a loss in gross revenues of approximately $565,000 a year.

San Antonio Company Explains Fare Situation

Makes frank statement of its reasons for rearrangement of fare on basis that includes nickel pass—Earnings and operating expenses summarized for four years

AS WAS told in ELECTRIC RAILWAY JOURNAL, the San Antonio Public Service Company, San Antonio, Tex., put into effect on July 10 a 10-cent cash fare, three tokens for 25 cents and a nickel card good for one week to sell for 30 cents entitling the holder to ride for 5 cents on street cars or 7 cents on car lines beyond the city limits or on buses. In addition, for children between five and twelve years of age provision is made for 5-cent cash fare and six tickets for 25 cents and for school children under seventeen a 10-cent cash fare with twenty tickets in a book for 85 cents and forty tickets in a book for $1.65.

This new schedule of fare was proposed in an official communication addressed to the Mayor and City Commission on July 2 advising them of a readjustment in the car rates. In making this adjustment the company states that it is important to secure a rate that will produce the revenue necessary for the company to put its finances in condition to maintain proper service and to continue as a factor in the development of the city. In this twelve-page official document the company outlines the situation which confronts it and the reasons therefore, believing that with a thorough understanding the city will be in accord with the rate adjustment. Among the difficulties are the paving obligations, improvements on which will cost the company approximately $100,000.

In November, 1922, the company reduced its fare at the request of the City Commission from 8 cents and four tickets for 30 cents to a straight 6-cent fare. The company agreed to try this rate of fare to determine whether this would bring in a revenue which would make the operation financially satisfactory. It did not do so, and in November, 1924, the fare was raised to 10 cents for rides beyond the city limits on the just principle that those who rode the furthest should pay more. Although the amount of business has increased, the expense in handling it has also increased.

A table of earnings and operating expenses for the past four years shows an operating income of $6,533,002, operating expenses $6,689,297 and a deficit of $156,294. Another table is included showing the amount of taxes, $609,661, and paving maintenance expense, $61,534. This is introduced to show that while the company has been forced to make up a deficit of $156,293 in the last four years, the car riders have paid through this company $671,196, or more than 10 per cent of their fares, to the general public, for which as car riders they receive no direct benefit.

The company through W. B. Tuttle, president, states that with operating expenses more than double those of the pre-war level and the present rate of fare increased only 20 per cent it was economically impossible to earn a reasonable return on the investment. In addition to its present situation, the management received a request from the employees to increase the wages sufficiently to allow them to have one day of rest in seven, and for other improvements in their working conditions. The company has been unable to grant these requests as they would involve expenditure of money not being earned.

In the decree issued by the United

Digitized by Google

States court on Nov. 26, 1919, the city of San Antonio and the Mayor and Commissioner and their sucessors in office were enjoined from enforcing an ordinance passed March 28, 1918, prohibiting the San Antonio Public Service Company from changing its rate of fare without the consent of the Mayor and city of San Antonio. This decision was sustained by the Supreme Court of the United States.

In conclusion, the message to its patrons states:

We are aware of the fact that the decision of the federal court gives us the right to make this change, but we greatly prefer to do this with your full knowledge and complete approval. The sincerity of this proposition, and the genuine necessity for an increase in our rate of fare and the fairness of the rate proposed must appeal to your sense of justice, and to the people as a whole.

Portland May Have Express Trolleys

Harry R. Miller, author of the Miller-Schorn plan for speeding up traffic, has suggested to the city of Portland, Ore., an express railway system. The suggested plan includes through street cars, making stops every half-mile or mile at regular stations; buses to handle the local traffic and subways under street intersections connecting the loading stations with the sidewalks. The new system, it is claimed, would greatly improve traffic movement and afford safety to car riders and pedestrians. The cost is placed at $40,000 a mile. It is estimated that leases from the railway for the terminals on the streets and from business houses and other interests for the use of the subways would bring in a return sufficient to pay the cost of the construction.

Withdraws Abandonment Petitions

The Benton Harbor-St. Joseph Railway & Light Company has withdrawn its petition to the Michigan Public Utilities Commission to abandon its interurban lines between Benton Harbor and Dowagiac and Benton Harbor and Watervliet in Michigan. An announcement to this effect was made by Henry W. Wallsmith, general manager. The line some time ago petitioned for the right to cease supplying service to these towns. The new action is taken to mean that railway service will be continued.

Start Made on $53,000,000 Philadelphia Terminal

Fitting ceremonies were held on July 28 to mark the beginning of construction work on the Pennsylvania Railroad's new Philadelphia passenger terminal project. Ground was broken at Cuthbert and Twentieth Streets at 11 a.m. Thus was started the excavation for the subway which is to connect the proposed underground suburban station near Fifteenth Street and the Parkway with the new main station to be erected on the west bank of the Schuylkill River. The Philadelphia passenger terminal improvements, including the additional electrification of suburban lines now under way, will represent a total expenditure of approximately $53,000,000.

More Subway Talk in Chicago

New plans presented to Chicago City Council—Eastern syndicate asks 50-year grant

NEW plans for a subway system in Chicago, much greater in scope than any scheme previously considered, were presented the week of July 20 to the City Councilmen by Alderman L. J. Grossman. Stating that he speaks for a group of Eastern financiers whose names he was unwilling to disclose, Alderman Grossman declared that by granting a 50-year franchise the city can obtain 131 miles of subways costing $467,000,000. He said that $50,000 has already been spent on preliminary plans and that work could be begun within six months after the granting of such a franchise.

The proposal as outlined by Mr. Grossman provides not only for tubes in State, Clark and Franklin Streets, in the downtown section, but for underground lines almost to the limits of the city on the north and south sides in State, Clark and Halsted Streets and Ashland, Kedzie and Western Avenues, east and west in Washington Boulevard, Roosevelt Road and 63d Street, diagonally in Archer, Grand and Milwaukee Avenues and several loops and connecting lines.

Exhaustive engineering, legal and financial data and charts were presented to the Council to show the willingness and competency of the syndicate to finance such a system.

The syndicate proposes to build the subway in three periods. The first, comprising four-track tubes in the Loop district and one two-track tube to each outlying district, would, however, be a complete transportation system in itself, the survey explains. Construction would be carried on by the "open-cut" method, thereby eliminating boring and blasting, except beneath the river. With 10-cent cash fares, or three tickets for 25 cents, the program calls for amortization of the $467,000,000 investment in 50 years and presentation of the subways to the city at the end of that period for $1.

Informed of the Easterners' proposal, acting Corporation Counsel James W. Breen and adviser to Mayor Thompson on traction matters, was skeptical. He expressed the view that it is "just another subway scheme." He declared that the only way Chicago will obtain a subway system is by special assessments and public bond issues and that proceedings of this nature are now being considered by the city administration.

An Interesting Experiment

THERE seems but one way by which the street car can hold a profitable place in modern city transportation. That is through building up the quality of service offered. Neglected, run-down equipment, worn and battered cars, listless employees and irregular service will mean public patronage at a minimum.

The policy of the Kansas City Public Service to build up a service designed to appeal to the public and to increase patronage is an interesting experiment. No doubt it will prove a wise and valuable move. The considerable improvements already made in the rebuilding of tracks and in the brushing up of cars very likely have had their influence, and when the program in this respect has been completed the beneficial results will be further evident.

The outcome of the plan to add special improvements to a group of 45 cars and to try these out on one line after another will be particularly interesting. The improvements are designed to add to the comfort, convenience and attractiveness of the cars. It is reasonable to expect that street car riders will respond to efforts of this type. If the result should not be a perceptible growth of patronage, it would at least mean increased public good will and pretty definite assurance of a stabilized position for this form of urban transportation.—*Kansas City Star.*

Status of Wage Issues in Chicago

Assurance of settlement by mediation of the wage dispute now pending between officials of the Chicago Rapid Transit Company, Chicago, Ill., and its trainmen was recently given by representatives of both parties. According to union and company leaders, the decisions of the mediation board, which is still to be chosen, will be accepted as final by both.

Progress toward settlement of the Chicago Surface Lines wage difficulty has been delayed several weeks by the failure of the two members of the Board of Arbitration to pick a third member. Circuit Judge Kickham Scanlan and E. J. McIlraith, Chicago Surface Lines staff engineer, were chosen July 19 by the wage conference to represent the union and the companies, respectively, on the mediation body.

Further complication of the surface lines wage situation appeared on July 21 when leaders of the local metal trades council met to formulate wage demands for the 4,000 mechanics employed by the system. An average increase of 12½ cents an hour will probably be asked.

AWARDS FRANCHISE.—Citizens of Perry by a vote granted the Iowa Railway & Light Company a new franchise to extend over a period of 25 years.

Higher Fare Schedule Filed in Holyoke

A revised rate schedule for the Holyoke Street Railway, Holyoke, Mass., filed with the Massachusetts Department of Public Utilities on Aug. 1 by L. D. Pellissier, president, proposes an increase of fares from 6 to 10 cents, with ticket concessions and zone changes. Ten-cent cash fares with transfer privilege tickets at four for 30 cents and in some instances tickets at 10 cents, the latter to take the place of two 6-cent fares in certain cases under the present system, constitute the main features of the proposed readjustment submitted by the company as a means of deriving additional revenue. Without this subsidy, it is stated, the company cannot continue to give service except at a loss.

Regulations governing zone A, in which City Hall is now a universal fare limit, are modified. By the new schedule a 10-cent cash fare will be required to ride across the zone, but a 7½-cent ticket will entitle the holder to ride through the zone as far as Race and Dwight Streets in one direction and as far as High and Appleton Streets in the other. This is in pursuance of the company's desire to maintain the lowest practicable rate on short-haul business. Overlaps will be allowed on certain lines to carry passengers beyond points that now call for the payment of a second fare.

On the Amherst division fare limits have been changed and on the Westfield line tickets will be sold four for 75 cents, each ticket good for one ride in through cars between the end of the Westfield-Holyoke line and Dwight and Race Streets, Holyoke.

The company's report to the Department of Public Utilities for six months ended June 30, 1927, shows operating revenue of $438,012, compared with $463,487 for a similar period of 1926, and a net loss after all charges of $3,905, against a net profit of $8,613 for the first six months of 1926.

Settlement in Rainier Valley Expected

If the Seattle & Rainier Valley Railway accepts a proposition which has been formally adopted by the Seattle City Council, fares on the private line, including right of transfer to the city lines, will be reduced from 10 cents cash to an 8⅓ cent token. M. C. Sampsell, president of the company, is said to have agreed to the arrangement, designed to enable the Rainier Valley line to pay the city $77,135 which is owed in gross earnings franchise tax. For each transfer accepted from the Rainier Valley Railway by the Seattle Municipal Railway, the private company will be allowed 1⅔ cents to apply on its delinquent franchise tax.

The Seattle Municipal Railway will continue to operate buses along Empire Way, the City Council has decided, following a public hearing. Residents of Rainier Valley protested the award of the bus franchise to the Seattle & Rainier Valley Railway. A monopoly of transportation in the valley was asked by the company several months ago, when the Council made demands that it fulfill its franchise obligations by paving between the tracks of Rainier Avenue. Two concessions, however, have been granted the company when the Council agreed to relieve it of paying a gross earnings tax of 2 per cent after Jan. 1, 1928, and of carrying city firemen and policemen free.

Marking Time in Batavia

Batavia, N. Y., without transportation facilities since the Batavia Traction Company abandoned its line a month ago, is awaiting definite action on a bus system to fill the gap. While the City Council has granted the company permission to operate a bus line, Stephen W. Brown, president of the company, reported to the Council that the line has not the necessary means to finance the bus project. He explained that persons who had been expected to back the project had withdrawn their support. L. H. Shultz, president of the Western New York Motor Lines, Inc., operating routes from Buffalo to Rochester and Le Roy, has suggested a citizens' stock company, to operate the bus system.

Scranton Company Wins Modification Order

The Scranton Railway, Scranton, Pa., has succeeded in its effect to have the Pennsylvania Public Service Commission modify its order regulating the travel of one-man cars over crossings in this city. The modification order by the commission agrees to the railway's proposition to have the watchmen maintained by the railroad at the Lackawanna Avenue and the Elm Street crossings signal one-man cars and operate the electric railway de-rail near the crossings. A co-operative arrangement for the payment of the watchmen's salaries had been agreed upon by officials of the Scranton Railway, the D., L. & W. Railroad and the Central Railroad of New Jersey. This co-operative arrangement has been approved by the commission. The electric railway maintained that one man was sufficient to regulate each crossing and that the cost of this man's service should be shared jointly.

The company, in filing its application for a modification, claimed that it was costing more than $15,000 a year to maintain watchmen at these crossings.

The commission's permit is a revision of a former order dated May 25, 1926, in which the company was authorized to operate the one-man cars. The original order directed the railway to maintain watchmen at the three crossings, and ordered operators of the one-man vehicles to come to a positive stop within 15 ft., of each crossing in order that the motorman-conductor by due diligence might satisfy himself as to the safety of proceeding.

Seven-Cent Fare in Fresno

The Fresno Traction Company, Fresno, Cal., has been authorized by the Railroad Commission to place in effect a fare of 7 cents to apply to all lines now operated either entirely in the city of Fresno or partly in the city of Fresno and partly in the unincorporated portion of the county of Fresno and within the present 6-cent fare zone, and that tickets or tokens, unlimited as to time for use, and each entitling bearer to one ride within the limits of said zone, be offered for sale on the cars of the company at the rate of three tickets or tokens for 20 cents.

The changes in rerouting, schedules and service proposed by the commission's engineers at the hearing appear to be satisfactory to the city of Fresno and Fresno Traction Company and the latter expressed a willingness to try the new plan.

New Fares in Westchester Effective to Sept. 1

The Public Service Commission of New York, on June 29, extended until Oct. 1, 1927, the schedule of fares authorized on Sept. 1, 1926, to be effective until July 1, 1927, on the lines of the New York & Stamford Railway in New Rochelle, Larchmont, Mamaroneck, Rye, Port Chester and other municipalities in Westchester county. The present fares were authorized after the various municipalities waived the provisions of franchises with reference to fares and they have consented to an extension until Oct. 1, 1927.

Negotiations are now pending between the County Transportation Company, Inc., and the various municipalities looking to the establishment of a system of bus transportation, but these negotiations have not been completed and extension is made to permit of a satisfactory arrangement being made. It appeared at the hearing on this petition that the operating results on the lines on the present fare basis have not been favorable but have shown a loss, and the company maintained that it could not continue operations unless the present schedule was continued during the additional time required to complete negotiations for bus service.

Drive for Organized Labor in St. Louis

The Metal Trades Council of St. Louis, Mo., informed the Central Trades and Labor Union, on July 24, that it intends to organize 100 per cent the shops of the United Railways, St. Louis. Unions that are affiliated with the Central Trades and Labor Union were asked to aid in organizing crafts that are not strictly under the jurisdiction of the Metal Trades Council.

Conductors and motormen were organized in the winter of 1917-1918 and after a brief strike won official recognition. The carmen are affiliated with the Amalgamated Association.

Court Reluctantly Appoints Third Wage Arbitrator

Supreme Court Justice Harley N. Crosby at Buffalo, N. Y., has appointed former Judge Frederick W. Kruse of the Appellate Division as third member of the board of arbitration to settle the controversy between the Buffalo & Erie Railway, Buffalo, and its employees, members of the Amalgamated Association, over a 10 per cent cut in wages ordered May 1, 1927.

Counsel for the railway applied to the court for the appointment of the third arbitrator. H. L. Mack, former vice-president in charge of construction for the International Railway, Buffalo, chosen as a member of the board to represent the railway, was unable to agree with Harry Solomon, for Local 592 of the Amalgamated at Fredonia and Local 624 of the Union in Buffalo, upon a third member.

Attorneys representing the Amalgamated claimed the courts have no jurisdiction in labor disputes. In his decision Justice Crosby said:

I have reluctantly come to the conclusion that the court must appoint the third arbitrator. My reluctance arises from a conviction of the futility of any form of compulsion in solving labor disputes. Compulsory arbitration is a misnomer. Enter compulsion, exit arbitration. The reason that compulsory arbitration will not work is that one side is, or can be, compelled. Under our Constitution, men, either singly or in bodies, cannot be compelled to involuntary labor except as punishment for crime. That is as it should be. None nowadays believe in slavery.

However, my convictions in regard to the futility of compulsory arbitration cannot dispose of certain obvious things. These parties entered into a solemn agreement providing for a form of arbitration. This agreement was no idle ceremony.

Business Men Prefer Trolley

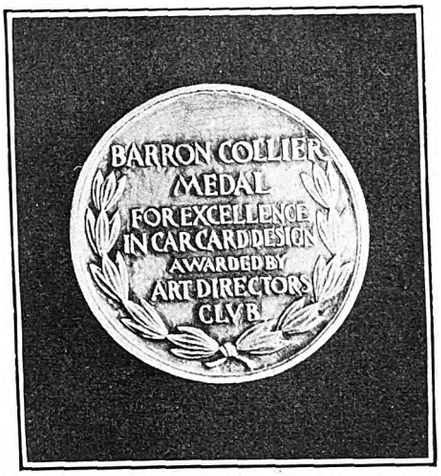
A number of Columbus, Ohio, residents, through the Business Men's Association, has presented a resolution to the City Council protesting against a proposal of the Columbus Railway, Power & Light Company to establish a bus line instead of extending the trolley line to their section of the city. The action was taken at a mass meeting of the Citizens and Business Men's Association on July 13. The association would be agreeable to a bus line if a franchise ordinance would specifically state the length of time the bus service would be maintained and the exact time of the railway extension.

Reduced Rate Tickets at Worcester

In connection with the rezoning of suburban motor coach and electric car routes, the Worcester Consolidated Street Railway has adopted a system of reduced rate tickets. The lines affected are the Worcester-Shrewsbury-Northboro and Marlboro coach route, the Worcester and Shrewsbury car route and the Worcester, West Boylston, Oakdale and Clinton coach route. The purchase of reduced rate tickets will enable passengers on these lines to save 20 to 25 per cent in fares. The fare rate for those who do not buy reduced rate tickets will be 10 cents for each zone. The rate for the reduced tickets varies and tickets must be used in specified territory.

Art Prize Goes to South Shore Line

The Chicago, South Shore & South Bend Railroad, Gary, Ind., has just carried away unusual honors with one of its advertising posters at the sixth annual Exhibition of Advertising Art held at the Art Center in New York City.



Reverse of Barron Collier Medal

Three of the posters used during the last year by the South Shore Line in advertising its service were accepted for exhibition and one was awarded two medals—the Art Directors Club medal and a medal given by Barron Collier as a special prize for meritorious poster design advertising railroad service.

All three South Shore Line posters were the work of the late Oscar Rabe Hanson. The poster which won first prize was entitled "Homeward Bound" and pictured wild geese in flight silhouetted against a full moon.

South Shore Line poster which won Art Directors Club and Barron Collier Medal in sixth annual exhibition

The South Shore Line poster was entered in competition with the work of some of the leading artists and advertising agencies of the country. First honorable mention in the poster group, after the award of the two medals for the South Shore Line poster, was given to R. H. Macy & Company, the New York department store, and the New York Central Lines received second honorable mention for one of its posters.

Reproduction of the work exhibited will be published in the "Annual of Advertising Art" to be published this summer. This annual has been published for the last five years following the exhibition and has become the standard work of reference for artists, advertising men, advertisers, printers, engravers, publishers, art students and others.

The South Shore Line brings out a new poster every month. These are displayed at the elevated railroad stations of the Chicago Rapid Transit Company and at the South Shore line stations between Chicago and South Bend. This type of advertising was adopted about two years ago when Britton I. Budd became president of the railroad and has attracted much attention and favorable comment. Many of the posters featuring the Indiana Dunes have been used in the classrooms of the public schools.

No Negligence in Stopping Car on Curve

The Pennsylvania Supreme Court has upheld the right of a street railway to stop its car on a curve, when that is at a street corner, and to use standard rail. The issue arose in the case of Low vs. Harrisburg Railways, where a female passenger, alighting from a car at such a point, caught her heel in the groove of the curve rail and was thrown down and injured.

The Supreme Court found that the rail involved was of a type generally employed for curves, that its use did not indicate lack of proper care on the part of the company, that the car was accustomed to stop at about that point, and that "street railway companies do not have fixed stopping places and cannot be expected to come to a stand with exactness each time at the same point where passengers are discharged." Hence the verdict of the lower court was reversed and judgment was entered for the defendant company.

The opinion was handed down on June 25, 1927.

INTERURBANS TO ASSIST AT STATE FAIR.—Representatives of interurban lines serving Indianapolis have assured the Indiana Board of Agriculture that these companies will operate special trains to Indianapolis to accommodate attendants at the Indiana State Fair to be held the first week in September. The trains probably will be operated Wednesday or Thursday at special rates.

Recent Bus Developments

Town Overruled by State Board

The State of Massachusetts has overruled a town which tried to prevent a line of buses from passing through. The Boston & Maine Transportation Company had obtained the necessary licenses from the several cities and towns for the operation of buses between Lowell and Worcester, except for the town of Littleton, which has declined to grant a license. The petitioner's application was filed with the Littleton Selectmen last January; but the failure of the Selectmen to grant the request after all the other intervening municipalities between Lowell and Worcester had issued permits, gave the State Department of Public Utilities jurisdiction which has been exercised in an order just issued in favor of the Boston & Maine Transportation Company. The license granted by the State Department of Public Utilities, thus overruling the town, provides that the buses shall run through the town of Littleton without stopping to take on or discharge passengers.

City of Detroit Rents Equipment

The Detroit Department of Street Railways has entered into an agreement with the Detroit Motorbus Company under which the bus company will rent the city 20 or 25 single-deck buses to be put into service on a new route from the northern section of the city to the Book-Cadillac hotel. Del A. Smith, general manager of the department, asked that his department be authorized to rent the buses for an indefinite period at 31 cents a mile. His recommendation was approved by the City Council. It is intended to paint the buses in accord with the color scheme now used on the city-owned buses.

The purchase of the garage and storage building at Schoolcraft and Newton Avenues from the Detroit Motorbus Company to store and repair D. S. R. buses now in use in the northwest section of the city has been authorized at a price of $24,000. Its utilization will enable the D. S. R. to vacate two buildings now in use at Grand River and Ward Avenues and Grand River and American Avenues being rented at $1,000 a month.

Regulatory Measure Introduced in Georgia

If a measure introduced in the Georgia Legislature is passed and signed by the Governor, all persons, firms or corporations operating a bus or buses will be compelled to register with the Secretary of State, post a bond of $5,000 against the injury of passengers and discharge all drivers arrested or convicted for driving while under the influence of intoxicating liquors.

The measure provides, among other things, that all persons, firms or corporations operating a bus line or wishing to operate a bus line in Georgia shall register with the Secretary of State, giving the names and addresses of all officers and stockholders; that before any bus can be operated, insurance in the sum of $5,000 must be provided against each person injured in an accident; that drivers arrested or convicted on charges of driving while under the influence of intoxicating liquors must be discharged upon the penalty of losing the company's charter, and that no municipality shall have the right to interfere with the operation of buses or bus lines except to enforce speed and police regulations.

Bus Service Started

The Texas Traction Company has started bus service to the River Crest section of Arlington Heights, suburb of Fort Worth. It is part of a crosstown line extending to Riverside and Oakhurst. The buses operate on a fifteen-minute schedule. The River Crest line ends at the grounds of the River Crest Country Club. Date of the starting of bus service to Diamond Hill remains indefinite, A. F. Townsend, manager of the company said. The Texas Electric Railway owns and operates the properties, formerly comprising the Texas Traction Company.

Transportation Plan at Miami Beach Changed

Adoption of a new transit plan for Miami Beach, Fla., with bus lines to all parts of the city and a 10-cent fare from any part of Miami Beach to Miami has been announced by the transportation committee of the City Council of Miami Beach and the Miami Beach Railway. The system does away with the small street cars, the jitneys and small buses, and uses only the large trunk line cars and the large buses formerly used in Miami, with seating capacity of 22. All lines will have regular schedule.

Under the franchise, voted in 1924, the Miami Beach Railway has the right to operate street cars without competition along its routes, and to change the mode of transportation by vote of the City Council.

The street cars will have a five-minute schedule both ways between Miami and South Beach and a ten-minute schedule between Miami and North Beach, at 23d Street and Park Avenue. Street car lines in Alton Road north and in Sheridan Avenue will be discontinued in favor of buses.

"Golden Arrow" Between Chicago and Detroit

A new phase of rail and motor coach co-ordination, whereby the long haul goes to the buses and the short haul to the electric railway, has been introduced by the Shore Line Motor Coach Company in collaboration with the Chicago, South Shore & South Bend Railroad. The unusual service, which is known as the "Golden Arrow," was started on July 22 between Chicago and Detroit. The journey between the two cities is completed in 8½ hours, six of which are required for the non-stop motor coach run.

Passengers using the "Golden Arrow" on the eastbound trip board the high-speed South Shore Line trains in downtown Chicago for a 2½-hour trip to South Bend, where they transfer directly into the new Shore Line motor coaches running to the heart of Detroit. Similar service is provided in the opposite direction. One trip each way is made daily, the schedule being so arranged that passengers may devote the entire morning to business in either city and still reach either Chicago or Detroit in time for dinner in the evening.

The fast train service of the South Shore Line and the non-stop run by motor coach enables the trip to be made in three hours less time than other bus services between the two cities, and nearly as fast as express trains on competing steam railroads. No stops are made for meals as the schedules are so arranged that passengers travel between Chicago and South Bend on South Bend Shore Line dining car trains.

Two new 25-passenger White motor coaches equipped with wash-room, inside baggage compartment and observation section are being operated in the "Golden Arrow" service. Although of standard 29-passenger coach dimensions, the coaches have chairs for only 25, the extra space being used for the conveniences of the patrons.

Substitution Proposed in Green Bay

The Wisconsin Public Service Corporation has asked the City Council of Green Bay, Wis., for permission to tear up the tracks on the Duck Creek line of its railway system and substitute regular bus service over this 6-mile route. The corporation has offered to maintain the present schedule, the same rate of fares and transfer privilege to the other lines of the company.

In presenting the matter to the public, C. R. Phenicie, vice-president, pointed out that his company only recently substituted bus service for electric service on all of the city lines in Manitowoc and on the interurban line between Manitowoc and Two Rivers, Wis., and that the company is now negotiating to substitute bus service on the city and interurban line in and between Marinette, Wis., and Menominee, Mich.

Digitized by Google

Further, it was pointed out, the city of Sheboygan, Wis., has substituted bus service on all but one railway line in that city. The Wisconsin Power & Light Company has advised the state commission of its plan to substitute buses for electric interurbans connecting Oshkosh, Fond du Lac and Neenah, Wis., and had received tentative permission to experiment with a schedule of this kind on Aug. 1. The city electric lines in Oshkosh and Fond du Lac will be operated as usual.

Bus Line to Supplant Railway Line

The New York State Railways filed a petition on July 14 with the Public Service Commission for permission to discontinue operation of its railway service on North James Street in the city of Rome, and the Utica Railway Co-Ordinated Bus Lines, Inc., has applied to the commission for consent to operate a bus line, under which transportation service would be afforded the James Street territory. The city of Rome has already consented to the operation of the bus route. Public hearing will be held on the petition.

Buses Serve White Plains

Cars were not seen on Aug. 1 on Main Street of White Plains, N. Y., for the first time in twenty years, when the Third Avenue Railroad substituted buses on the line to Silver Lake Park, the sole surviving trolley line, which ran on Main Street.

It is expected that the tracks will be torn up within a month. Merchants have been petitioning for the removal of trolleys for more than five years, arguing that the narrowness of Main Street did not leave room for both the cars and automobiles which brought customers to their stores.

Co-ordination of Kansas City-Clay County Service

A co-ordination of interurban service, and equalization of fares between the electric car and the motor bus, is announced by the Kansas City, Clay County & St. Joseph Railway, which operates an electric line between Kansas City and Excelsior Springs, Mo., and between Kansas City and St. Joseph, Mo.

Robert P. Woods, vice-president and general manager, has just announced the purchase of the competitive bus line between Kansas City and Excelsior Springs. As a result of the purchase, the number of electric cars to Excelsior Springs has been reduced by half and the service supplemented by buses. Liberty, Mo., a half-way point on this line, will be the division point, and passengers will be transferred there to buses.

The bus fare will be the same as the electric car fare, an increase of 5 cents. Although there has been public protest on this increase, it is believed there will be no formal protest, as the bus makes the 30-mile trip to Excelsior Springs for 90 cents, while the electric car fare is 82 cents, plus a city fare of 8 cents.

No change is being made in the St. Joseph service.

The company now operates eighteen trains daily, both ways, between Kansas City and Liberty, nine of them going on through to Excelsior Springs. Fifteen buses are operated, both ways, over the same route.

Sixteen trains are operated each way daily between Kansas City and St. Joseph.

The equipment of the company consists of 25 electric cars and eleven buses. The system has 70 miles of main line track and has 225 employees on its payroll.

Buses Appear on Staten Island a Month Ahead of Time

Fifty-four emergency buses were in commission on Staten Island on Aug. 1 when the power operating 58 miles of municipal surface lines on the Island was cut off by the Staten Island Edison Company because of the failure of the city to pay a debt of $175,000. These vehicles, supplied by the Department of Plant and Structures of the city and by independent concerns, among them the Tompkins Bus Corporation, took care of the business of the five municipal electric railway routes and the three trackless trolley routes in the interior of the island. They carried 13,000 people apparently without confusion on a 10-cent fare. Although reports have it that many patrons were disgruntled over the increase in fare and automobile drivers over the inability to park on the upper level of the St. George terminal now occupied by the buses there was a general approval of the change. It was stated that Corporation Counsel Nicholson would be requested to wind up the affairs of the city in connection with municipal operation.

The cessation of service came as a surprise as the Staten Island Edison Company on the night previous agreed to continue to furnish power until Sept. 15 on the promise of Mayor Walker that the city would make every effort to expedite payment of its unpaid bill of $175,000. The company's bills for power, furnished for more than a year, have been held up by the Finance Department and efforts on the part of the company to bring about payment by the city have been unsuccessful. On Sept. 15 it was expected that the Tompkins Bus Corporation, which received a franchise from the Board of Estimate on July 28, would have received its certificates of convenience and necessity from the Transit Commission. It was to be ready to operate buses over the routes now covered by the surface and trackless trolley lines.

One editorial writer summarizes the situation on Staten Island by saying that buses, trackless trolleys and ordinary trolleys all had their chance under municipal operation. On a total capital investment of some $275,000 the trackless trolleys showed a deficit of more than $300,000 in four years of city operation. The passengers paid a 5-cent fare. It cost the city 12 cents to carry them. On its regular trolley system, which it leased from the receiver of a road that had previously been operated privately, the city lost about $375,000 in five years.

Buses Substituted on Stamford-Sound Beach Line

The Connecticut Company has been authorized by the Public Utilities Commission to abandon railway service between Stamford and Sound Beach. The company has long contended that the Sound Beach line was not a profitable venture. This, together with the fact that paving contracts have been awarded to the amount of $250,000, of which the railway would have to pay a part, is given as the reason for the decision to substitute bus service. The line was originally established in 1902. The commission made no decision in regard to ending the Sound Beach Avenue bus line at Laddin's Rock instead of Adam's Corner. The public wants the buses to run to Adam's Corner, while the Connecticut Company believes the route should end at Laddin's Rock to avoid a traffic hazard unusually acute at the Post Road turning.

Parley in Louisville Delayed

Mayor Joseph T. O'Neal, of Louisville, Ky., announced recently that he would not have time to discuss the proposed co-ordinated bus and electric railway franchise with Louisville Railway officials until after Sept. 1.

James P. Barnes, president of the railway, said his company was ready to discuss the franchise as soon as Mayor O'Neal's schedule permitted a conference.

Right to Continue St. Charles Line Sought

The United Railways, St. Louis, Mo., and its subsidiary, the Missouri Electric Railroad, have applied to the Missouri Public Service Commission for a certificate of convenience and necessity so that they can continue to operate a bus line along the St. Charles Rock Road between Wellston and St. Charles, Mo. The application is for authority to operate five six-wheeled vehicles, with a special service between Wellston and the West Lake Amusement Park at the junction of the St. Charles Rock Road and Natural Bridge road. The company on the St. Charles-Wellston run has a schedule of 35 minutes for the trip with a single fare of 35 cents and 60 cents for the round trip. These rates include the toll for crossing the bridge spanning the Missouri River at St. Charles.

Financial and Corporate

St. Louis Property Sold

Reorganization committee buys in United Railways at foreclosure sale Aug. 1 for $49,601,000

THE United Railways, St. Louis, Mo., in receivership since 1919 was bid in for $49,601,000 by the St. Louis Public Service Company at a foreclosure sale on Aug. 1. The new company was formed by the reorganization committee, headed by Frank O. Watts, president of the First National Bank in St. Louis. It bid the minimum price fixed by United States Judge Faris, who has jurisdiction over the receivership.

Court Must Confirm Deal

Former Congressman William L. Igoe, the special master, who handled the sale, will report to Judge Faris on Aug. 12 to secure approval of the sale. The purchasers offered $8,301,000 for all the parcels of the railway properties and agreed to assume obligations of the old company totaling $41,300,000. The bid also included an offer of settlement of unsecured general claims against the United Railways on the basis of 33⅓ per cent if paid in cash and 66⅔ per cent if the claimants would accept preferred stock in the new company. The chief general creditor is the city of St. Louis which has a claim of $2,396,321 for back mill tax which with interest to date will total $3,500,000.

The City Counselor says the city will demand full payment of the tax. The city in common with other unsecured creditors has received the offer of one-third cash or two-thirds in preferred stock. It is almost certain that should Federal Judge Faris approve the sale and reduce the city's claim to one-third of the original claim of $2,396,321 without interest an appeal will be taken to the higher federal courts. The United States Supreme Court has already sustained the legality of the mill tax. Claims of unsecured creditors other than the city will total about $1,000,000.

The members of the reorganization committee are Frank O. Watts, J. K. Newman, A. L. Shapleigh and J. Sheppard Smith.

Commission Approval Sought

On Aug. 1 application for approval of the reorganization of the United Railways as outlined by the reorganization committee was filed with the Missouri Public Service Commission. Joint petitioners with the committee were the St. Louis Public Service Company and the City & Suburban Public Service Company.

The reorganization plan provides for the elimination of $41,296,000 of outstanding securities of the old company, including $16,383,000 in preferred stock and $24,913,000 in common stock. The securities that remain undisturbed are the $36,300,000 of general 4s and the $2,000,000 of Suburban Consolidated bonds. Bonds to be replaced by new securities include $9,790,000, St. Louis Transit Company twenty-year improvement 5s, and $4,500,000 St. Louis & Suburban general mortgage 5s.

New Capital Set-Up

The capital set-up of the new companies will include $4,500,000 sinking fund 5 per cent gold bonds of the City & Suburban Public Service Company, 53,845 shares of 7 per cent preferred stock of St. Louis Public Service Company, 345,645 shares of common stock of St. Louis Public Service Company and 19,348 shares of preferred stock of St. Louis Public Service Company with no stipulated dividend.

Duke Interests Get Charlotte Property

Transfer of the North Carolina Public Service Company, Greensboro, N. C., to the Southern Power Company was scheduled for Aug. 1, following an announcement of the sale of the local company to the Duke interests, with headquarters at Charlotte, N. C., made some time ago. Following the transfer the Charlotte concern will own the railway franchise as well as the gas and electric light rights. It is believed that the purchase of this company is one more step in the development of the Piedmont & Northern Railroad. With control of the car lines of Greensboro, High Point, Salisbury and Winston-Salem, the Southern Power Company, which owns the Piedmont & Northern, will be in a position to get into all the large cities of the Piedmont plateau without the expense of laying tracks or negotiating with other concerns for rights over their lines.

Key System Affairs Reviewed

Fewer passengers are being carried, but increased rates do not produce gross earnings to correspond with estimates

DURING the year 1926 the Key System Transit Company, Oakland, Cal., provided additional service to its patrons to the extent of 29,839 passenger-car-miles and 111,034 bus-miles, but transported 9,249,963 fewer passengers than were transported in the year 1925. The revenue passengers on the street railway division decreased 6,537,560, which is 8.46 per cent less than the previous year. The free transfer passengers on this division decreased 1,128,403, which is 5.23 per cent less than the previous year. The revenue passengers on the Key division decreased 1,584,000, or 8.89 per cent less than last year. The revenue passengers therefore decreased 8.54 per cent and the total revenue and transfer passengers 7.93 per cent compared with the previous year.

The decrease in street car passengers carried during the year was apparently due in part to a further increase in ownership and use of automobiles and in part to an increase in fares, 16.66 per cent, that took effect in January, 1926. The decrease in passengers on the Key division resulted in part from the coincident increase in one-way passengers fares and the reduction in automobile ferry rates across the bay. The reduction in auto ferry rates affected the single-trip riders but had little or no effect upon the number of commuters traveling.

The passenger revenue increased from $7,160,288 in 1925 to $7,447,397 in 1926, or $287,108; the gross operating revenue for 1926 increased over that of 1925 by $307,713. It is apparent that the increase in rates more than offset the reduction in the use of transportation, but it failed to result in the increase in revenue which was contemplated at the time of the hearing before the Railroad Commission. A very heavy increase in operating expenses occurred

INCOME ACCOUNT OF THE KEY SYSTEM TRANSIT COMPANY FOR THE YEAR ENDED DEC. 31, 1926

Gross operating revenue		$7,597,584
Operating Expenses:		
Way and structure (maintenance)	$293,141	
Equipment (maintenance)	520,124	
Power (maintenance and operation)	713,366	
Conducting transportation	3,264,221	
Traffic expenses	9,362	
General and miscellaneous	837,416	
Transportation for investment and construction overhead (credit)	253,643	5,383,990
Net operating revenue		$2,213,594
Less taxes		474,446
Operating income		1,739,147
*Add non-operating income		$165,622
Gross profit		1,904,769
Sundry Charges:		
Depreciation	690,985	
Amortization of franchises	8,762	
Abandonment of obsolete equipment	9,251	708,999
Balance—Current operations		$1,195,769
Deductions:		
Bond interest	$915,615	
Other interest	43,567	
Miscellaneous	18,193	977,376
Surplus—Current operations		$218,393
Profit and loss adjustments (credit)		188,139
Surplus		$406,533
Surplus from prior year		284,194
Total surplus		$690,727
Less four quarterly prior preferred dividends paid		413,644
Balance to surplus account		$277,083

* Includes $105,323.41 net revenue, Key System Service Company.

VALUATION FIGURES OF KEY SYSTEM TRANSIT

As of Dec. 31, 1926:	Reproduction Cost New	Reproduction Cost New Less Depreciation	Historical Reproduction Cost
1 Total operative property, system (not including materials and supplies)	$37,784,297	$26,189,140	$27,058,065
1-A Work in progress (operative property) approximate $2,000,000	2,000,000	2,000,000	2,000,000
2 Materials and supplies on hand Dec. 31, 1926	784,985	784,985	784,985
3 Total operative property, system	40,569,282	28,974,125	29,843,050
4 Total non-operative property, system	1,501,540	1,431,489	1,440,391
5 Total operative and non-operative property, system (including materials and supplies on hand Dec. 31, 1926)	42,070,822	30,405,614	31,283,441

during the year, mainly on account of the labor award, made effective the first of 1926, granting an eight-hour day with increased pay to the platform men. This increase in operating expenses alone was $400,000.

The company had thirteen bus lines operating at the end of 1926 and installed an additional line on Telegraph Avenue in the early part of 1927. None of the bus lines has been self-supporting and in a number of cases where they serve isolated or partially developed territories the losses have been severe. It had not been contemplated when these lines were installed that these buses would pay for their cost of operation, but the results have been so disappointing that it has been found necessary to take steps to reduce the amount of bus service rendered.

It was estimated at the time the rate decision of the commission was issued that the temporary rates would produce an additional revenue of $846,000 a year, divided as follows:

Temporary rate	Net Amount of Increased Revenue on Annual Basis
7-cent street car fare	$526,000.00
21-cent single trip transbay fare	256,000.00
$5.20 monthly commutation transbay fare	64,000.00
Total estimated additional revenue	$846,000.00

The actual experience for the year 1926 under the emergency rates showed increased passenger receipts of only $277,870, divided as follows:

	Increased Revenue Over 1925
Street car division under the basic 7-cent fare	$259,086
Key division under the basic 21-cent transbay fare (decrease)	17,147
Key division transbay commutes	35,931
Total net increase in passenger receipts	$277,870

As pointed out in the interlocutory decree of the Railroad Commission in which temporary rates were established, it was required that "the company should make a detailed inventory and appraisal of its physical property in such a manner as to enable it to set up a full and complete property ledger."

The valuation work has been carried on under the supervision of Richard Sachse, the company's consulting engineer, in conjunction with the Railroad Commission engineers. The valuation report by Mr. Sachse has been completed and presented in evidence before the commission.

Net additions to the property completed and put into operation during the year 1924 involved an expenditure of $855,714, for the year 1925 $355,243 and for the year 1926 $1,355,794, making a total of new work completed for the three years $2,566,752. In addition to this amount there was in progress $4,335,870 of work not completed at the end of the year 1926, of which the estimated amount to additions is $3,813,524, making the total net additions for the three years $6,380,276.

MISCELLANEOUS STATISTICS OF THE KEY SYSTEM TRANSIT COMPANY FOR THE YEAR ENDED DEC. 31, 1926

Passengers Carried:		
Traction Division:		
Cash and ticket fares—7 cents		67,030,518
School tickets—3½ cents		2,168,191
Commutes (East Bay cities)		721,327
Miscellaneous—14 cents, 21 cents, etc.		828,637
Total revenue passengers		70,748,673
Free transfer passengers		20,439,835
Total revenue and transfer passengers		91,188,508
Key Division:		
21-cent transbay fares	7,373,109	
Commutes—transbay	7,885,482	
10-cent children's fares	164,930	
San Francisco-Sacramento railroad tickets	228,670	
Miscellaneous transbay tickets	68,646	
Total transbay passengers		15,720,837
7-cent fares (East Bay cities)	472,206	
3½-cent school tickets	43,068	
Total passengers (East Bay cities)		515,274
Total revenue passengers—Key division		16,236,111
Entire System:		
Revenue passengers		86,984,784
Revenue and free transfer passengers		107,424,619
Average fare, revenue and transfer passengers—traction division, cents		5.43
Average fare, revenue passengers—transbay, cents		15.67
Average number of passengers per day—traction division		249,832
Average number of passengers per day—transbay		43,071
Street car fares increased from 6 cents to 7 cents and transbay fares from 18 cents to 21 cents on Jan. 15, 1926. Monthly commutation rates increased from $4.80 to $5.20 on Feb. 1, 1926.		
Car Mileage:		
Passenger car mileage	18,064,234	
Freight car mileage	32,538	18,096,772
Car Hours:		
Passenger car-hours	1,751,087	
Freight car-hours	6,364	1,757,451
Ferryboat mileage		112,780
Motor coach mileage		960,835
Rolling and Floating Equipment Owned:		
Passenger cars		540
Motor coaches		41
Work cars		103
Tool cars and wreckers		4
Electric locomotives		3
Ferryboats		5
Miles of track owned		266.87
Miles of track operated under lease, etc.		2.27
Total miles of track operated		269.14
Miles of bus lines operated (round trip distance)		64.78

COMPARATIVE STATISTICS OF KEY SYSTEM TRANSIT

Comparison between car-mile ratios of traction division of Key System Transit Company and the averages of 93 city railways—data from A.E.R.A., May, 1925, pages 1622-23.

	Key System Transit Company, Traction Division, Cents per Car-Mile 1926	98 City Companies Cents per Car-Mile 1926
Railway operating revenue	35.33	45.65
Railway operating expense	28.93	33.63
Net operating revenue	6.40	12.02
Net revenue—auxiliary operations	.....	0.11
Taxes	2.11	2.84
Operating income	4.29	9.29
Non-operating income	0.28	0.68
Gross income	4.57	9.97
Deductions from gross income	3.75	7.10
Net income	0.82	2.87
Way and structures	2.88	4.49
Equipment	3.95	4.41
Power	4.11	4.37
Conducting transportation	16.02	15.59
Traffic	0.05	0.12
General and miscellaneous	3.49	4.46
Transportation for investment—credit and construction overhead	1.58	0.01
Total operating expenses	28.92	33.63
Railway operating revenue per mile of single track	24,415.00	35,557.00
Revenue Passengers:		
Per mile of single track	342,941.00	529,448.00
Per passenger-car-mile	5.0	6.5
Total Passengers:		
Per mile of single track	442,019.00	682,888.00
Per passenger-car-mile	6.4	8.4
Ratio:		
Transfer passengers to revenue passengers (per cent)	28.9	28.4
Revenue car-miles:		
Per mile of single track	69,126.00	77,887.00
Per car-hour	10.1	9.0

Forty one-man, two-man traction cars of the company's standard 900 type were purchased and put into service during the year. Two traction division passenger cars were constructed at the railway's own shops and put in service. Work car equipment consisting of four differential chute motor cars and six Differential chute trailers were also purchased and put in service. These are said to have saved the company a great deal of money in connection with the large amount of track reconstruction work undertaken during the year. One hundred and eighteen Key division cars are being equipped with Tomlinson automatic couplers as rapidly as they can be relieved from regular service and it is contemplated that this work will be completed about the middle of 1927. Six Yellow buses and fourteen Fageol buses were purchased and put into service during 1926 and the early part of 1927 as part of the company's automotive fleet.

Lester S. Ready, president, by whom the report was submitted, said in concluding his summary of the affairs of the company for the year:

The communities served by this company are still enjoying very rapid growth, and as stated in the previous annual report "the greatest aid toward their continued successful development is transportation." This company is providing such transportation, but it has not yet been able to collect sufficient revenue to justify the service furnished. The company confidently expects the co-operation of its patrons as well as the communities in which it operates in order to furnish the service that is required for a rapidly growing district.

Rockford-Freeport Line Bought by Ellis Interests

Milton Ellis, Rockford, Ill., recently acquired the Rockford-Freeport Railway, upon his bid of $46,800 at receivership sale conducted by the master in chancery. The interurban owns 26 miles of track. It appears that ownership of the $490,000 of bonds of the interurban passed to the Rockford Public Service Company some time ago, so that ownership of the interurban reposes with that company. The sale of the Rockford-Freeport line disposes of all but one of the interurban and local city railway bankruptcies, leaving only the Belvidere, Lake Delavan & Janesville lines to be disposed of later.

In connection with the realignment of the properties of Rockford, it is significant that the Illinois Commerce Commission has approved the sale of the Elgin & Belvidere Electric Company and the Rockford & Belvidere Electric Company to the Elgin, Belvidere & Rockford Railway, authorized to operate as a carrier between Rockford and Elgin. In addition to authorizing the purchase of the two companies on May 1, by C. N. Ellis, Jr., from Bion J. Arnold, the commission authorized the issuance and sale of $1,300,000 of securities to finance the transaction. Mr. Arnold, the former owner, becomes president of the new company and Mr. Ellis, vice-president and general manager.

Wants City to Take Over Tramway

The Colorado Springs & Interurban Railway system wants the city of Colorado Springs, Colo., to purchase its railway system and offers it for $500,000, 50 per cent of it to be paid the company in city bonds if the city likes the idea. The company states that it cannot put any more revenue into it; that regardless of the fact that it has been given an increase in fare and has substituted buses in some sections, it is not paying what it should, and in the event that the revenue falls lower the system must be junked. City officials acknowledge the offer and say that they are considering the matter. The company is owned by the Myron Stratton estate. William Lloyd, president of the board of trustees, presented the offer to the city.

Sale of Central California to Southern Pacific Urged

Oral argument has been heard by the Interstate Commerce Commission on the application of the Southern Pacific Company for authority to acquire control of the Central California Traction Company through the purchase of its capital stock. The electric railway extended from Stockton to Sacramento, Cal., a distance of 55 miles, and its acquisition by the Southern Pacific is opposed by the Atchison, Topeka & Santa Fé. The Southern Pacific proposed to pay $2,900,000 for the stock of the electric railway, most of which is owned by Herbert Fleishhacker, its president. Of this sum $2,200,000 will be paid in bonds of the Pacific Electric Railway.

Counsel for the electric railway has pointed out that the California Railroad Commission has recommended approval of the Southern Pacific's application on the ground the financial condition of the electric railway requires its immediate sale and because it would be an economic waste for the Southern Pacific to build a line between Stockton and Sacramento while the electric railway is available. It was also figured the road has been a losing proposition since its organization, it having been kept going only through lines made by its president and is now being operated at a loss of about $10,000 a month for nine months of the year.

President Fleischhacker urged the commission to approve the application.

Control of Oklahoma Railway Passes to Kansas City Interests

Through the purchase of the control in the Southwest Securities Company, a new group of owners has come into control of the Oklahoma Railway, operating in Oklahoma City and running three interurban lines that serves a dozen central Oklahoma towns.

Reports of the closing of the deal in financial circles are confirmed by H. P. Wright, Kansas City investment banker, who represents the buying group. Terms have been reached by the directors, and, at a meeting of the stockholders in St. Louis on July 27, the sale was confirmed. Mr. Wright refuses to reveal at this time the identity of his associates, or the amount of money involved in the purchase.

An engineering firm, it is learned, has just completed a survey of the railway properties in Tulsa for prospective buyers. Engineers, however, advised against the purchase until the present jitney competition has been removed.

In addition to the properties in Oklahoma City (65 miles of track) the company operates six bus lines as supplementary service. The property also includes three electric lines out of the Oklahoma capital city to El Reno, Guthrie and Norman, with a total trackage of more than 75 miles. The system was built at a cost of $7,500,000, according to G. T. Lackey, president.

Mr. Wright is chairman of the board of the banking firm of Prescott, Wright, Snyder & Company, is a director of the Frisco Railroad, president of the Kansas Gas Company, and is represented on the board of more than a score of large Southwestern companies.

Steam Depreciation Hearing on Nov. 9

The Interstate Commerce Commission has set the date for a rehearing of the case in Docket No. 15,100, Depreciation Charges of Steam Railroad Companies, for Nov. 9, 1927. The steam roads have been asked to file with the commission on or before Sept. 1 a statement setting forth specifically and in detail the matters in regard to which they desire to introduce evidence at the further hearing. In postponing the similar proceeding with respect to the electric railways the commission indicated that that hearing would not be held until after the conclusion of the case of the steam carriers. It is planned to hold another meeting of the American Electric Railway Association's committee on depreciation before the hearing on Nov. 9.

Hocker Line Sale on August 26

The Hocker interurban line, officially known as the Kansas City, Lawrence & Topeka Electric Railway, will be sold at public auction on Aug. 26 from the steps of the Johnson County courthouse at Olathe, Kan., Peter W. Goebel, special master appointed by the federal court announced recently. Discontinuance of the line was ordered July 6 by Judge John C. Pollock at the request of Mr. Goebel, the receiver.

Separate Unit Organized in Bristol

The Bristol Traction Company, Bristol, Conn., has been organized to take over the railway which has been operated as a part of the Bristol & Plainville Electric Company. The last session of the Connecticut General Assembly authorized the change, believing that better results can be secured by operating the railway as a separate unit. J. Henry Roraback has been elected president of the railway and Charles L. Campbell secretary and treasurer.

New Haven Assumes Springfield Obligations

The Massachusetts Department of Public Utilities has approved the purchase by the New York, New Haven & Hartford Railroad of the twenty-year first mortgage bonds originally issued by the Worcester & Southbridge Street Railway, now a part of the Worcester Consolidated Street Railway, dated Sept. 1, 1902, and to be extended to Aug. 1, 1930. The price to be paid is not to exceed the face value and accrued interest, totaling $398,000.

Further, the Department of Public Utilities has approved the purchase at an aggregate price not exceeding $198,337, by the New York, New Haven & Hartford Railroad, of notes or lease warrants of a face value of $239,033 of the Springfield Street Railway in accordance with a conditional sales agreement covering 50 cars purchased recently.

Legal Notes

CALIFORNIA—*Overturning of Vehicle Raises Point of Negligence.*

The overturning of a vehicle operated by a common carrier raises an inference of negligence under the doctrine of *res ipsa loquitur.* [Seney vs. Pickwick Stages, Northern Division, Inc., 255 Pac., 279.]

FEDERAL SUPREME COURT.—*Statute Requiring Paving Upheld.*

The electric railway in Ft. Smith, Ark., operated originally under a franchise requiring it to pave a part of the streets. In 1921 the company surrendered this franchise to the State for an indeterminate permit which did not require it to do any paving. In 1923 the Legislature passed a statute of nominally general nature, though because of its terms it applied only to the Fort Smith property, requiring it to pave a portion of the streets. As it did not do so, the city constructed the paving and brought suit against the company for its cost. The railway company claimed that the absence of reference to paving in the permit meant exemption, but the Supreme Court said "No such exemption appears in the permit. Provisions of this character are not lightly to be read into a contract between a state and a public utility." The court also found that the constitution of Arkansas reserves the right to the Legislature to alter any corporate charter and said: "The imposition of burdens, otherwise legitimate, upon a public service company cannot be held invalid as confiscatory because the permitted rate does not allow an adequate return." [Fort Smith L. & T. Co. vs. Board of Improvement, 47 Supreme Court, 595.]

FEDERAL SUPREME COURT—*Certificates, Taxes and Insurance May Be Required of Interstate Bus Carrier.*

An Ohio law requires all motor transportation companies to obtain a certificate from the Public Utilities Commission and that this law shall apply to interestate commerce only in so far as such regulation is permitted under the Federal Constitution. An interstate bus carrier was required to pay the annual license fee required of all automobile users and an additional tax for the maintenance and repair of the highways and for the administration and enforcement of the laws governing the use of same, and also to take out liability insurance. All of these provisions were upheld by the Federal Supreme Court. [Clark et al. vs. Poor et al., Public Utilities Commission, 47 Supreme Court Rec., 702.]

ILLINOIS.—*Authority of Commission Over Highway Crossings Upheld.*

In 1905 an electric railway built tracks on an unimproved public dirt road, which, at one point, passes under a steam railroad track in a very narrow arch, and agreed with the township to stop all its electric cars and flag them through this arch as there is not room for a vehicle to pass through it when an electric car is also passing. Later another highway was opened, which greatly reduced the vehicular travel on the dirt road, to an average of about six vehicles per day, and the Illinois State Commission authorized the electric railway to install a signal system at that point and thereafter not stop its cars before entering the arch. The township brought suit but the action of the commission was upheld. [Illinois Commerce Commission vs. Omphghent Township, 156 N. E., 766.]

KANSAS.—*A Switch Is Not a Nuisance.*

A railway company undertook to install a "Y" switch at a certain corner in a residential district. An abutting property owner attempted to enjoin the company on the ground that the switch was noisy, but the court held that such noise "was simply one of the inconveniences which inevitably attend the establishment of a residence in a city where street railways are lawfully permitted to construct and operate transportation facilities." [Nuttle vs. Wichita R. & L. Co., 256 Pacific, 128.]

MASSACHUSETTS—*Injuries Not Due to Negligence.*

Evidence showing that plaintiff slipped and fell on banana peel on stairway owned by defendant, and open to public, held insufficient to support recovery in the absence of any showing of defendant's negligence. [Mascary vs. Boston Elevated Ry. Co., 155 N. E., 637.]

MISSOURI—*Rules on Injuries to Pedestrian at Crossings.*

Evidence that a street car approaching a crosswalk and a pedestrian crossing a street were moving at a speed of about two or three miles per hour, and that the car could have been stopped within 3 ft., held to warrant submission to jury on theory of street railway's liability for injuries to pedestrian because of its traffic supervisor's failure to signal motorman, whose view was obstructed by cars on parallel track. [Bocklitz vs. Wells, 293 S. W., 71.]

NEW YORK—*Decides When Franchise Can Be Revoked.*

A street railway franchise, granted by the state on consent of the city, can be revoked by the state alone, and by it only through judicial proceedings and judgment. [International Ry., vs. Schwab Mayor, 221 N. Y. Supp., 384.]

OHIO—*State Courts Will Not Interfere with Federal Receiver in Franchise Matters.*

Proceedings were brought to declare a franchise void because an interurban railway declined to pay part of paving charges, as required in its franchise, but it developed that all such charges had been paid up to the time that a federal receiver for the railway had been appointed. The State Supreme Court held that the Federal Court having obtained prior jurisdiction and custody of the property, the method of its operation was withdrawn from the jurisdiction of the state courts. [State ex rel Crabbe vs. Indiana C. & E. Traction Co., 157 N.E., 15.]

OHIO—*Passengers Frightened by Headlight on Locomotive.*

Plaintiff was a passenger on a street car at about 6 p.m. It was very dark and a railroad locomotive was about to cross on its tracks at an intersection where the tracks of the railway cross its tracks. Because of the darkness the engineer had turned on the headlight of the locomotive. The street car and locomotive reached the intersection at about the same time, but there was no collision. As the street car was crossing the railroad tracks some of the passengers became frightened by the headlight of the locomotive. Plaintiff was not amongst them as she was somewhat drowsy. The other passengers, in their fright, trampled on her resulting in physical injuries. A verdict was directed in favor of the defendant at the end of plaintiff's case and was affirmed on appeal, on the ground that the injury to the plaintiff, following the fright produced on the passengers by the headlight of the locomotive, was solely caused by the passengers and the defendants were not parties to this act of the passengers produced by fright arising from mistakenly anticipating the danger of a collision which did not occur. [Mancuso vs. Cleveland Ry., et al., 155 N. E., 243.]

WASHINGTON—*Company Not Responsible for a Passenger Alighting at Unusual Place.*

A street railroad, as a matter of law, was not in duty bound to protect and warn a passenger who alighted from car at other than usual stopping place, in view of passenger's familiarity with intersection, and unimpaired opportunity to see and be fully advised of exactly where he was alighting and the approach of any auto or other vehicle. [Lindgren vs. Puget Sound Int. Ry. & Power Co., 253 Pac., 791.]

WISCONSIN—*Jurors Charged with Misconduct.*

In a case involving the question of whether the driver of an automobile made or could have made a sufficiently short turn to avoid getting on the tracks of the street railway, during the trial ten of the jurors went to the scene of the accident and made tests in turning from one street into another. The results of these tests were discussed in the jury room. Held, that this constituted grievous misconduct on the part of the jury and should result in a new trial unless it plainly and affirmatively appears that the result of such tests had no influence upon the verdict of the jury. [Temlicka vs. Mississippi Valley Public Service Company, 213 N. W., 666.]

Personal Items

Beaver Valley Personnel Announced

Effective with the resignation of General Manager C. D. Smith, on June 30, the administration of the Beaver Valley group of companies with headquarters at New Brighton, Pa., was announced to be handled as follows:

Commercial work will be under the commercial department of the Pittsburgh Railways, with the commercial manager of the Beaver Valley companies reporting direct to the commercial manager of the Pittsburgh Railways.

Research work will be handled by the research manager of the Pittsburgh Railways.

Operations will be handled by the general manager of the Pittsburgh Railways.

The following local officers may be addressed concerning the particular phases of the work for which they are responsible, and they are authorized to approve bills, invoices, requisitions, statements and other papers requiring such attention.

J. H. Meyer, superintendent of maintenance, in charge of way and structures, overhead lines and equipment.

J. R. Marshall, superintendent of transportation, in charge of operation of cars.

H. O. Allison, commercial manager, in charge of commercial work, personnel work, claims.

A. E. Messenheimer, operating engineer, in charge of operating engineering work.

Mr. Smith is now connected with the Cleveland Railway, Cleveland, Ohio, as executive head of the new department of personnel there.

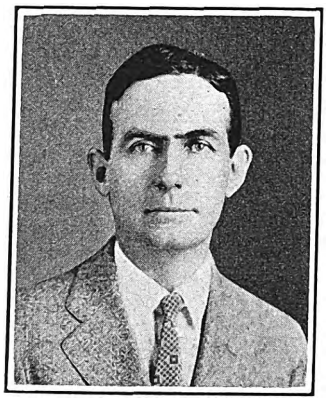
E. J. Shuler, since the latter part of 1925 metallurgist and research engineer of the New Orleans Public Service, Inc., New Orleans, La., has resigned. That company has a completely equipped laboratory, and it was in his work there that Mr. Shuler developed methods and a type electrode for manganese welding. The Bethlehem Steel Company thought so well of this work that it retained Mr. Shuler to instruct its men at its foundry and switch and frog plant at Steelton, Pa.

Carl W. Stocks, editor of *Bus Transportation* and associate editor of the Electric Railway Journal, has been invited by Herbert Hoover, Secretary of Commerce, to serve on a committee of 40 students of street traffic which will draw up a model ordinance to be recommended for adoption to all American cities. Mr. Stocks also accepted membership on the papers committee of the metropolitan section of the Society of Automotive Engineers.

William C. McCallum, B.Sc., London, England, has been appointed an assistant to the chief engineer of the Yorkshire Electric Power Company. After he was graduated from the University of London he received his works training with Dick, Kerr & Company, Ltd., at Preston, and later had an extensive experience in electric traction and power application both in England and Japan. During the great war he, while a lieutenant in the Royal Engineers, was awarded the Military Cross in connection with his special services on the western front.

F. V. Skelley Made Superintendent of Equipment at Des Moines

F. V. Skelley, formerly assistant general manager of the Tri-City Railway of Illinois at Rock Island, Ill., has been appointed superintendent of equipment



F. V. Skelley

of the Des Moines City Railway and the Des Moines & Central Iowa Railway. He assumed his duties at the Fourth and Maple Streets shop on July 15. In this capacity Mr. Skelley succeeds C. R. McMahon, who has become affiliated with the Key System property at Oakland, Cal.

Mr. Skelley has had sixteen years experience in electric railway work, starting in the shop of the Tri-City Railway in 1911. He was graduated in the electrical engineering class of the Iowa State College in 1907 and then took a three-year apprentice course in the Hawthorne shop of the Western Electric Company at Chicago. Thence he went to New York as a sales engineer of the company there, where he remained till an opportunity was offered to get into the electric railway field.

W. G. Gove, superintendent of equipment of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., planned to sail for Europe on Aug. 6 on the *Majestic*. Among other things he will study operation on the lines of the London Underground, some of the conditions on which are akin to those on Mr. Gove's own property.

J. J. Gorman Named to Detroit Street Railway Commission

Mayor John W. Smith of Detroit, Mich., has announced the appointment of John J. Gorman as a member of the Street Railway Commission to fill the vacancy caused by the dismissal by the Mayor of former Commissioner H. H. Esselstyn. For several years Mr. Gorman was the head of the John J. Gorman Company, men's furnishers, established in 1889 by his father. More recently he has been in the real estate business. The Mayor announced that he took especial pleasure in the appointment because he was thus able to introduce into public service one of Detroit's younger men "extremely well qualified and in a position to give the city not only of his abilities but of his time."

Mr. Esselstyn was deposed during the campaign against the proposed International bridge which is to be built over the Detroit River joining the cities of Detroit and Windsor, Ont. The action was taken by the Mayor because of the opinion expressed over the radio by Mr. Esselstyn in speaking in favor of the proposed bridge. Mayor Smith maintained that if a bridge were to be built, it should be under municipal control to be in keeping with the city's expressed policy in favor of municipal ownership of its utilities. At the recent referendum the people of Detroit voted to permit the private company to construct the bridge.

Mr. Esselstyn is a civil engineer. He has spent a number of years in public service. His candicacy for Mayor of Detroit has recently been announced for the coming election. In 1918 he was appointed Commissioner of Public Works by former Mayor Oscar B. Marx. He resigned this position in 1919 during the term of former Mayor James Couzens, and later built the Belle Isle Bridge. In 1921 Mr. Couzens, then Mayor, appointed him a member of the Street Railway Commission.

OBITUARY

William I. Brobeck

William I. Brobeck, widely known San Francisco attorney, and director and former counsel of the Key System Transit Company, Oakland, Cal., died from a heart attack, July 27, while aboard the steamer *Queen* on an Alaskan trip. Mr. Brobeck was author of several noted legal treatises and served as assistant to the late Franklin K. Lane when the latter was city attorney of San Francisco. Among the noted cases on which he was retained was that of the United Properties Company, in which he represented F. M. (Borax) Smith. He was an outstanding figure in the reorganization of the Key System in 1923 and was senior partner in the law firm of Brobeck, Phleger & Harrison.

Mr. Brobeck was born in Rochester, N. Y., 58 years ago.

$250,000 Kansas City Project Ahead

The Kansas City Public Service Company, successor to the Kansas City Railways, Kansas City, Mo., is preparing to reconstruct the Eighth Street tunnel between Washington and Bluff Streets. It is to build an entirely new steel span over Bluff Street, the Missouri Pacific and Wabash Railroads, to Ninth Street and Union Avenue. The new system will span Union Avenue and terminate at Santa Fe Street.

An incline to the surface will begin at Santa Fe Street and end at the east line of Mulberry Street. From Mulberry Street to the state line the old "L" structure is to be removed entirely and a surface line used. It will connect directly with the Central Avenue bridge over the Kaw River. One through car line to be routed back over this line will be Fairmount Park-Central Avenue. These now are two separate lines. Other lines also may use the tunnel and "L."

An ordinance granting permission to the Public Service Company to complete this work has been submitted to the Council and referred to the public improvements committee for hearing. A. E. Harvey, chief engineer of the company, said progress of the work depended upon the arrival of the steel with which to span the railroad tracks. He said:

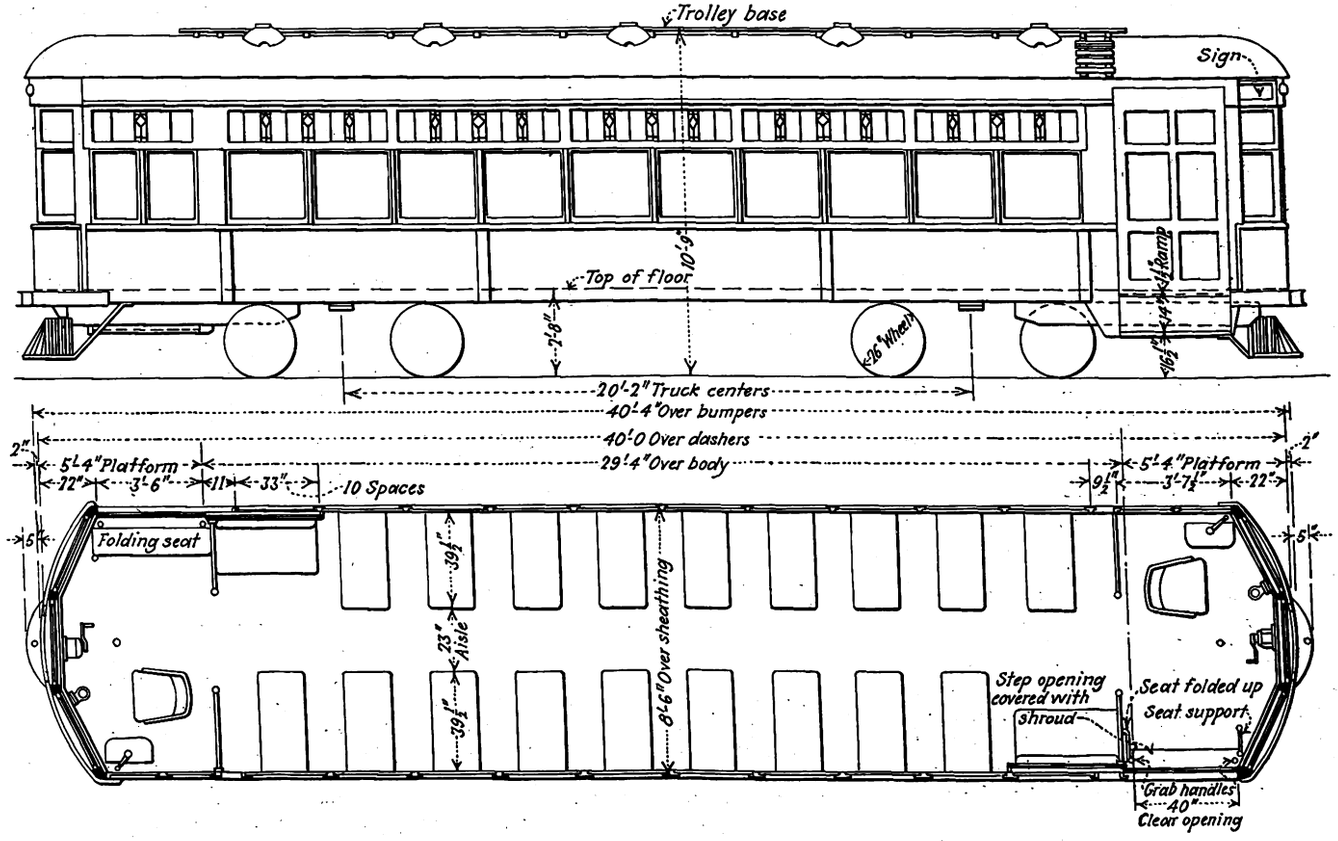
The steel will be ordered at once and it probably will take sixty days to fashion it and make delivery. The work in the tunnel really is minor, consisting mainly of cleaning, reconditioning tracks and putting in new drainage. Spanning the railroad tracks and keeping the ways open underneath for traffic will be the hardest task. Without attempting to set a definite date I should say that the new tunnel and "L" road route should be ready for use late next fall. The entire project will cost approximately $250,000, it now is estimated.

Mack Bus Deliveries Double in Second Quarter

Deliveries of Mack buses during the second quarter of 1927 more than doubled those in the first quarter, according to figures released by Roy A. Hauer, manager of the general bus department and vice-president of the Mack-International Motor Truck Corporation. Increase in deliveries for the three-month period ended July 15 over the first three months of the year was 137 per cent.

More than twice as many buses were delivered to electric railways and steam railroads throughout the second quarter than in the first, the percentage of

New Interurban Unit for Southwest Missouri Railroad



Delivery is expected in the near future of one double-end interurban unit recently ordered by the Southwest Missouri Railroad, Webb City, Mo., from the American Car Company, St. Louis, Mo. This car, the order for which was announced in the JOURNAL April 16, will be of semi-steel construction. The final specifications released by the car company follow:

Number of units	1
Type of unit	One-man, motor, passenger, interurban, double end, double truck
Number of seats	21
Builder of car body	American Car Company
City and state	St. Louis, Mo.
Date of order	April 4, 1927
Weight, total	35,000
Bolster centers	20 ft. 2 in.
Length over all	41 ft. 2 in.
Length over body posts	29 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8¾ in.
Height, rail to trolley base	10 ft. 9 in.
Window post spacing	33 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	General Electric straight
Car signal system	Faraday
Compressors	CP 27
Control	K-75
Couplers	American Car Company
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	N. P. Co.
Doors	Sliding
Floor covering	Linoleum
Hand brakes	Brill vertical
Heaters	Consolidated Car Heating Company
Headlights	General Electric J-65
Headlining	Agasote
Interior trim	Mahogany
Motors	Four G. E. 265, inside hung
Sash fixtures	Schechter post casing
Seats	Brill No. 201-B
Seating material	Leather
Steps	Folding
Step treads	Kass safety
Trolley retrievers	Ohio Brass Company
Trucks	Brill 177-E-1
Ventilators	Brill exhaust
Wheels	Cast iron, 26 in. diameter

Digitized by Google

increase being 165 per cent. Comparison of both quarters reveals that 60 per cent of total deliveries in the second quarter went to traction companies, as compared with 56 per cent in the first, indicating a 4 per cent increase in demand of traction companies for buses.

With the exception of two or three large individual orders for four-cylinder gas-electric drive buses and six-cylinder mechanical-drive buses, the greatest number of deliveries was made of 29-passenger, four-cylinder, mechanical drive buses of 225-in. wheelbase, indicating a continued demand for this particular model.

Versare Corporation Will Exhibit at Cleveland

One of the outstanding exhibits at the coming A.E.R.A. convention in Cleveland, Oct. 3-8, will be that of the Versare Corporation, 103 Washington Street, Albany, N. Y. It will exhibit among other things, a Versare bus, Model 6-SC-2, M-32.

In this connection, reports from exhibit headquarters are to the effect that ten companies have requested space in the truck exhibit.

Ten New Cars for Fort Worth

Ten new street cars, built at a cost of $150,000, will arrive at Fort Worth and be placed in service about Aug. 15, A. F. Townsend, manager Northern Texas Traction Company, Fort Worth, Tex., has announced. The cars are modern in every respect and were built on specifications of the utility by the St. Louis Car Company. Leather upholstering, automatic treadle rear doors, double trucks and a high-speed city service motor will be among improvements in the new cars. The size will be between that of the smaller cars in service now and the large, double-truck type.

"Demag News" Appears

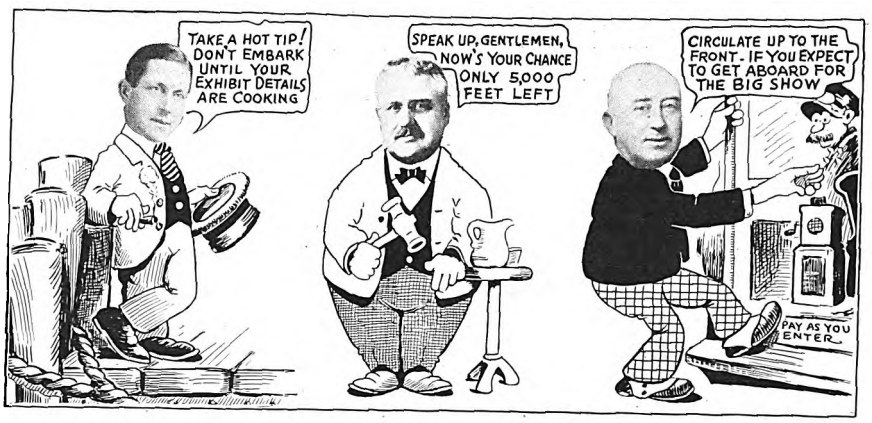
The *Demag News*, published by the Deutsche Maschinenfabrik A.G., of Duisburg, Germany, made its initial appearance as issue No. 1, July, 1927. The publication is to be a quarterly and will report on the many branches which the manufacturing program embraces.

The program includes the manufacture of every description of machine and appliance for mines, quarries, tunnel construction, power stations, railways, factories, the chemical industries, textile mills, etc., as well as complete plants for iron works, smelting works, crane and conveyor plants, etc.

A.C.F. and Not Fageol Delivered Buses to Worcester Railways

In the rolling stock items published last week the Worcester Consolidated Street Railway, Worcester, Mass., was reported as receiving five 29-passenger buses from the Fageol Bus Company of Detroit instead of the American Car & Foundry Motor Company.

EXHIBITOGRAPHS—No. 2



Oil-Electric Car Breaks Speed Record

All records for travel between Montreal and Toronto in the history of Canadian railroading were broken recently when the new type of oil-electric car, developed by the Canadian National Railways, made its inaugural trip between the two cities in the actual running time of five hours and 30 minutes. The actual trip, allowing for delays and slow orders over certain sections of the track, was made in five hours and 40 minutes, which is two hours and twenty minutes less than the International Limited, the crack Canadian National train running daily between Montreal and Chicago, covers the 334 miles between Montreal and Toronto.

New Publication on Modern Cars Issued by Westinghouse

Westinghouse Electric & Manufacturing Company has recently issued special publication 1770 on cars and car equipment. In this 32-page book is included many of the 1926 advances in the art of car design construction.

Like the former editions of this publication by the Westinghouse company, each page is devoted to a single car, including a halftone illustration, a blueprint floor plan with dimensions and complete tabulated data covering service performance, weights, electrical and mechanical equipment, dimensions, seating capacity, exit and entrance arrangement, etc.

This edition is available either from any Westinghouse district office or from the transportation section, advertising department, at East Pittsburgh. It should be requested by number and title.

Only 5,000 Sq.Ft. Left Under the Big Roof at Cleveland

McCloskey Torch-Pressed Steel Company Litigation Still Pending

Litigation referred to in the June 18 issue of ELECTRIC RAILWAY JOURNAL, page 1123, anent the McCloskey Torch Company and the Toledo Pressed Steel Company is continued in the Circuit Court of Appeals for the Sixth Circuit. While the McCloskey patent No. 1,610,301 of Dec. 14, 1926, was held invalid by the lower courts, Mr. McCloskey, trading as the McCloskey Torch Company, is continuing his fight against his former employees, the Toledo Pressed Steel Company. The case has been appealed and is still pending in the Sixth Circuit Court of Appeals, where Mr. McCloskey seeks a reversal of the lower court's decision.

Copper Jumps to 13⅜ Cents; Other Metals Climb

The non-ferrous metal markets continue to boil. Copper gained the most ground this week, with a net advance of ⅝ cent per pound in the domestic market and ½ cent in the c.i.f. price of the export association.

At the end of June considerable copper was sold at 12⅜ cents delivered. Aug. 3 a good volume of business was done at 13⅜ cents. At 12⅜ cents consumers showed little or no interest; at 13⅜, or at least at 13½ cents they bought quite freely. The former figure has not been in effect long enough to be thoroughly established. Foreign buying has been good all week, at steadily advancing prices. The export association advanced its price to 13⅜ cents July 30, to 13.50 cents on Aug. 2, and Aug. 3 the price was 13.65 cents. The domestic sales for the month of July involved a total tonnage fully three times greater than that of June, with buyers including wire-drawers and electric manufacturing companies as well as brass makers. The bulk of the business has been for

†Quotations withdrawn on account of strike.

August shipment, with some for September and only the exceptional lot for October.

As to lead, the American Smelting & Refining Co. advanced its official contract price for New York lead from 6.50 cents to 6.60 cents on July 29, and Aug. 3 a further advance to 6.75 cents was made. Sellers in the outside market have been obtaining premiums over the smelting company's price all week on good-sized tonnages, and the advance of Aug. 3 seems warranted by the brisk demand.

On an active week's business, with both consumers and dealers participating in the buying, zinc prices advanced moderately. High-grade continues to be quoted at 8 cents, New York, for spot carload lots, with the market dull.

Statistics issued by the American Zinc Institute on July 27 show 77,227 retorts in operation as of July 15, against an average of 80,373 during June. Stocks were also lower at mid-July than at the end of June, the figures being 41,083, compared with 43,858.

The advance in tin during the week is ascribed to speculative and dealer buying rather than to purchases by consumers. However, the market is firm. Little change is anticipated in the statistical position and no definite tendency up or down can be forecast.

ROLLING STOCK

Boston Elevated Railway, Boston, Mass., is reported to have asked for bids on ten convertible cars.

Pittsburgh Railways, Pittsburgh, Pa., is preparing specifications for the purchase of fifteen new light-weight interurban cars.

Virginia Electric & Power Company, Richmond, Va., has added five more White buses, Model 53 with 21-passenger capacity. These buses, which are in use in Norfolk, Va., bring this railway's total fleet in Virginia cities to 93.

Holyoke Street Railway, Holyoke, Mass., has put a new 25-passenger gas-electric Mack bus into service on its West Dwight Street line.

TRACK AND LINE

Columbus Railway, Power & Light Company, Columbus, Ohio, will lay 1 mile of new track on North High Street as part of its program to give the city additional service. Track also will be laid from Parkwood Avenue to Nelson Road, a distance of ½ mile, when crossing of the Norfolk & Western are eliminated.

Portland Electric Power Company, Portland, Ore., has let the contract for laying new rails and concrete base along several lines in Oregon City, Ore. The work on Water Street has been completed and the crew has started on the work on Main from Fifth to Twelfth.

Pacific Electric Railway, Los Angeles, is engaged in complete reconstruction of joint track on Main Street between Sixth and Ninth Streets. The 127-lb. girder rail will replace the old 87-lb. rail and an asphalt-concrete base with asphalt wearing surface will be used. Renewal of tracks and ties at curves on Marmion Way is under way.

Minneapolis Street Railway, Minneapolis, Minn., is finishing its new trackwork for 1927, the construction of eighteen blocks of new double-track line and the doubling of eight blocks of old single-track line. Hollowspun trolley poles are being utilized for the first time. With the opening of the double-track, eight-minute schedule is being observed on 50th Street from Penn to Xerxes Avenue instead of sixteen. The new line is from Bryant Avenue to Penn Avenue on 50th Street and on Penn Avenue from 50th to 54th Street. The new double-track work will enable extension of the Bryant Avenue car route from Bryant Avenue to Xerxes Avenue, serving a growing section with an alternative route downtown, reached now only in part by the Oak-Harriet line.

TRADE NOTES

Manganese Steel Forge Company, Philadelphia, Pa., manufacturer of Rol-Man manganese steel truck and car wearing parts, has recently opened a new office at 1335 Old Colony Building, Chicago. W. H. Potter, formerly in the main office of the company at Philadelphia, has been transferred to Chicago in charge of the new office.

Johns-Manville Corporation, New York, announces the election of Theodore F. Merseles as president. H. E. Manville, who has served as president since the death of his brother, T. F. Manville, in 1925, has been elected chairman of the board. Mr. Merseles retires from the presidency of Montgomery Ward & Company. He will continue as a director of that company and as chairman of its executive committee. While the business activities of Mr. Merseles have centered in Chicago since he headed the Montgomery Ward organization in 1921, he has retained his interests in the East, where most of his business life has been passed. After a short European pleasure trip with Mrs. Merseles, he will return to New York to assume his new duties about Aug. 15.

Pittsburgh Testing Laboratory, Pittsburgh, Pa., announces the removal of its Birmingham, Ala., laboratory to new quarters in that city, where a Riehle testing machine of 400,000 lb. capacity has been installed.

Morton Manufacturing Company, Chicago, Ill., has recently concluded arrangements for the establishment of two important foreign branches, one in connection with the Lyman Tube & Supply Company at Montreal, Que., which will cover the Dominion of Canada and the colony of Newfoundland, and the other with A. & S. Ash Brothers, a large railway equipment firm at Johannesburg, South Africa. The Morton organization is also considering arrangements for a world-wide distribution of its products.

D. B. Flower Manufacturing Company, 1217 Spring Garden Street, Philadelphia, Pa., maker of electric brush-holders, opened on July 1 its central district office in Pittsburgh at 614 Empire Building, A. B. Holcomb is manager.

ADVERTISING LITERATURE

Gold Car Heating & Lighting Company, Brooklyn, N. Y., has issued a 64-page catalog on electric heating for railway cars. This embraces electric heaters with both open coil and enclosed types of heating elements.

Economy Electric Devices Company, Chicago, Ill., is sending out a circon Economy meters that is a reprint of an advertisement appearing in Electric Railway Journal, issue of May 21.

New Departure Manufacturing Company, Bristol, Conn., is sending out a bulletin telling of the advantages of its ball-bearing electric motors.

General Electric Company, Schenectady, N. Y., is sending out an eight-page booklet describing gas-electric drives for buses and trucks.

Herman H. Sticht & Company, New York, N. Y., in bulletin No. 150 describe the new Ground-Ohmer, a direct-reading ground resistance meter.

Okonite-Callender Cable Company, Inc., Paterson, N. J., recently distributed a booklet on "Aerial Power Cable," describing its use.

Ransome Concrete Machinery Company, Dunellen, N. J., has published illustrated bulletin No. 105 A, on pneumatic concrete placers. The bulletin covers all phases of the subject and contains valuable data on working the apparatus.

Massillon Steel Casting Company, Massillon, Ohio, has issued a circular describing Tigerloy brake drums. It is a reprint of an advertisement appearing in *Bus Transportation*, issue of July, 1927.

Brady Award Deserves Wider Attention

EXTENSION of the time for presentation of briefs for the Anthony N. Brady Safety Award gives encouragement to electric railways to enter the contest. Prior to Aug. 1, the original date for the closing of the competition, only two companies had entered. As pointed out elsewhere in this issue by Lucius S. Storrs, managing director American Electric Railway Association, this showing by no means represents the real interest and accomplishments of the industry in this direction. There are impressive stories to tell, but the companies have been backward about presenting their cases. The time has now been extended to Sept. 1, and it is earnestly to be hoped that many additional railways will enter the contest.

When the Brady award was revived this year, after having been dormant since 1916, conditions of the contest were changed materially with the view to making the preparation of the briefs as easy as possible and encouraging a large number of entrants. Under the old conditions a complicated series of computations was necessary to determine the winner. The procedure made it difficult for the smaller companies to present their claims. At a meeting of the traffic and safety committee last January, however, the sentiment was unanimous that the award should be based simply upon "what the various companies show their accomplishments in safety to have been by answering certain general propositions and the standard accident statistical form of the A.E.R.A." To permit wide latitude in the presentations, the conditions of the contest were drawn up to resemble in a general way those of the Charles A. Coffin contest. Six factors were enumerated:

1. Good will gained as the result of safety work.
2. Original safety ideas and the adaptation of the ideas of others.
3. Improvements in service resulting from safety work.
4. Reduction in the number and seriousness of accidents.
5. Co-operation between management and employees in safety promotion.
6. Measures to promote sanitation and health.

A change was made also in the distribution of the prizes. Formerly, a gold medal was conferred upon the winning company, a silver replica upon the officer or department head who contributed most to the successful record of the company and a bronze replica to the employee whose services were most outstanding in the promotion of safety. It was felt that there were serious difficulties in the way of selecting the proper official and employee for these awards. Under the new conditions there will be three medals as before, but they will be given as first prizes to operating companies in three classes, grouped according to the number of vehicle-miles operated. This separation of the companies into three groups, depending on size, gives the smaller companies an equal chance with the larger ones, and it was hoped that many would be thereby encouraged to enter the competition.

Under these circumstances, it is somewhat surprising that only two railways have entered the contest. Many companies have put sincere effort into safety work and excellent results have been obtained. Their achievements may be well known locally, but so long as the companies hide their light under a bushel they cannot receive the wide recognition they deserve. There is yet time to correct this situation. Let every company with a commendable safety record make haste to inscribe its name on the roll of those competing for the Brady award.

Results Under Receivership in St. Louis

COMMENDABLE work by the receiver and management of the United Railways, St. Louis, is reflected in the annual report for the year ended Dec. 31, 1926. The comparative income and expense statement shows that gross operating revenue in 1926 decreased slightly from that in 1925, but that the net loss in 1926 was reduced to $43,564, compared with $206,174 for the previous year. The gross operating revenue has grown from $13,125,559 in 1917 to $18,873,430 in 1926. The number of passengers, however, has remained almost constant, being 403,300,696 in 1917 and 415,059,303 in 1926. The average fare per passenger, including transfers, in 1917 was 3.23 cents, while the average fare per revenue passenger in 1917 was 4.95 cents, compared with 6.90 cents in 1926. The number of passenger car miles has also remained practically constant.

These are some of the things which show the way the financial wind is blowing, so that the recent application of the company to the state Public Service Commission for an increase in fares was presaged on needs which the receiver is prepared to substantiate by facts from actual operation. On the management side more than 400 cars have been rebuilt and modernized and the other property has been carefully conserved. A great deal of attention was paid during the year to the more scientific making of schedules. As a result the average speed for the entire system has been increased. Operation of cars, however, is still impeded by the parking evil, but partial relief, particularly in the downtown congested district, was secured through the passage of an ordinance on Aug. 5, 1926, prohibiting parking on Grand Avenue between Laclede Avenue and Eastern Avenue. The record of the safety department shows during 1926 the smallest number of fatalities, the smallest number of collisions with persons, or animals, or wagons, the smallest number of accidents connected with shops and sheds, the smallest number of car collisions in the history of the company. For the third successive year a material reduction was made in the number of collisions with motor vehicles—the number in 1926 being approximately 2½ per cent fewer than in 1925—in spite of an increase of

Digitized by Google

14 per cent in the number of registered automobiles in the same year. The burden of taxes and other similar charges under which the company staggered is shown by the fact that the total for taxes, street paving costs and expense on account of city sewer construction was $2,196,481, or 0.814 cents per revenue passenger.

It is the circumstances under which this record has been made that are significant. Among them, of course, is the fact of operation under the limitations of the receivership, the condition of competition that exists in the city and the uncertainties with regard to the granting of a new franchise with terms sufficiently liberal to permit the successor company to carry on adequately after the conclusion of the receivership, likely to be terminated soon, since the properties have already been sold under foreclosure. When adequate allowance is made for all the adverse factors the results secured are certaintly most meritorious.

Reminders of the Old Picnic Days

RECOLLECTIONS of the early nineties are revived by the succession of news items telling about the handling of picnics en masse by buses operated by electric railways. One of the most recent of these items has to do with the transportation of 2,100 persons by bus by the Youngstown & Suburban Railway from Salem to Idora Park, a distance of 22 miles. In handling these 2,100 passengers 25 coaches were used, the start being made at 7 a.m. and the return movement from Idora Park at 6 p.m.

These are the bald facts. As stated before, it is the memories they and similar recurring events revive that are of interest. This particular incident harks back to the turn of the century reviewed so feelingly by Mark Sullivan. It stirs recollections of the old picnic days of popcorn, peanuts and panocha. Those were the days in which the open bench trolley car, decorated with American flags by day and illuminated with colored lights by night, was a thing of wonder, when every car used for a picnic carried a cop and every other car a band, when the street urchins, marauding at night, found great pleasure in pulling the trolley pole off the wire, giving every Jack a chance to kiss his Jill, and when motorman and conductor lugged a ponderous fender from one end of the car to the other at the end of the run. Excursionists picked daisies by the roadside when power went off the line. It was about this time that Ellis Parker Butler used the interurban as the peg on which to hang his story "Pigs Is Pigs" and every mud gutter band murdered "El Capitan."

But the problems presented in those days with respect to transportation were very much the same that they are at present. It was not infrequent in the nineties for the chairman of the picnic party to estimate that several hundred would need accommodations, only to find at the last moment that this number had been greatly swelled. It was so in the recent case at Youngstown. The first estimate was that about 500 would attend, but every day brought reports of an increase in number, until the night before the outing those in charge of it telephoned that about 1,200 were expected. This figure eventually was swelled to 2,100, but that did not phase the management any more than did the changes which were made in the old days. Considered from the vantage point of the present the methods of the turn of the century seem haphazard, indeed. Twenty years from now, however, the refinements of today may seem no less crude than do the methods of the late nineties, confined as they were then almost entirely to catering to the handling of chowder parties and the Schützenverein. The idea is the same. It is the execution that is different.

Much May Be Gleaned from the Layman

SALESMANSHIP is an art, the perfection of which requires more patience than petulance, more brain than brawn, more intuition than investigation and more contemplation than conversation. Whether efforts are concentrated upon product or personality, the crux of selling lies in personal conviction followed by a forceful telling. Everyone is engaged in telling this old universe something. Why can't the railways carry on the tradition of Chaucer's pilgrims and intrigue their patrons with the romance of riding?

Since the passing of the public-be-damned philosophy the stage has been set for a real selling job in the railway field. Unfortunately, some of the actors in the cast were insufficiently conversant with their rôles, while others, in their efforts to master the mechanics of their parts, missed the opportunity for finesse and art. Gradually these faults are being corrected and a new troupe is coming of age which bears as little resemblance to the old as perhaps the present-day transport methods will bear to those in vogue in twenty more years.

For his "layman ideas" and things which "smack" of the salesman C. S. Stackpole, whose address is published elsewhere in this issue, need offer no apology. It is to be regretted that it was not possible for every railway manager and his lowliest subordinate down the line to hear "what electric railways could do to sell transportation" from the point of view of an habitual rider. The regular car rider is well qualified to philosophize on "selling transportation." In fact, much might be gleaned from a perusal of its pages if the collective experience of car riders were set down in a book under the title "Memoirs of an Habitual Car Rider."

A Game Everybody Wins

MORE and more it is evident that the old game of consigning the public to the region of sulphurous gases and dancing imps is obsolete from the standpoint of the public utility. It was a dangerous game. It was like bluffing a poker player who holds a royal flush. The public at times may appear a trifle dense, yet there has never been any evidence that it lacked power when it is fully aroused. When it is bucked, it bucks. On the other hand, when called in as a consultant it often diagnoses the ills in a far better way than those who request its services.

Two outstanding examples of the value of the public as a consultant were recorded in the JOURNAL last week; one, editorially, in the matter of the Kansas City Public Service Company adopting recommendations from the Municipal Art Commission for a color scheme for its rehabilitated cars, and the other a news story dealing with the rehabilitation of rolling stock by the Utah Light & Traction Company. In the latter case this company went straight to the public, after first having produced a model car along the lines which it thought best for its patrons' comfort and from the standpoint of practical operation. It then sent over the city streets this powerful example of its willingness to provide better service, calling for suggestions as to improvements. These were forthcoming and were incorporated in the final design for the ten

Digitized by Google

car bodies and five trailer bodies recently placed in service. This was playing a game in which everybody wins and was changing the sulphurous gases of yesterday into the perfumes of Araby.

A Case Not So Easy to Judge

LEGAL action may follow rejection by the New York Transit Commission of the application of the New York Rapid Transit Corporation to sell to the Brooklyn-Manhattan Transit Corporation $20,000,000 of its 5 per cent refunding bonds at 80 per cent of par, or $16,000,000, the proceeds to be applied principally to the purchase of 150 new cars. Whether or not the case reaches the courts, the points involved cover some nice distinctions in intercompany relations and corporation finance, since the New York Rapid Transit Corporation is owned entirely by the Brooklyn-Manhattan Transit Corporation and its subsidiary, the Coney Island & Brooklyn Terminal Company.

The opinion of the commission in the case as reviewed covers eleven typewritten pages. It is not possible to go into all the intricacies of the matter. The companies appear to be just as sure of their position as the commission is of its stand in the matter. In furtherance of its position the petitioner, among other things, challenged the right of the commission to inquire into the reasonableness or merits of the proposed sale, claiming that this amounts to substitution of the judgment of the commission for that of the board of directors.

On the other hand, in the judgment of the commission, that case does not apply to the exceptional conditions that here exist, conditions made so by the fact that city money is tied up in the construction of lines on which the equipment is to be used and the further fact that recapture of some of the lines by the city appears to loom ahead as a possibility in the situation. The city contends that the needs of the petitioner should be met by the sale of refunding bonds of the Brooklyn-Manhattan Transit Corporation. It seeks to make the point that on the basis of a sale at 95, it would require only $16,842,000 of these bonds to yield the money now needed by the petitioner as against the $20,000,000 of bonds proposed to be issued for that purpose. Among the alternatives it suggests is an issue of car trust certificates. The commission also holds out for the sale of bonds by competitive bidding. The Brooklyn-Manhattan Transit Corporation contends that the sale of its first and refunding bonds at this time would constitute a breach of faith toward holders of the 6 per cent bonds. This is only another part of its case.

The issues involved are technical, too technical for the layman to understand. On that account it is unfortunate that even papers that should know better have not hesitated to intimate that in standing out for what they consider to be their rights, under the circumstances, the Brooklyn companies are attempting to indulge in sharp financial practices at the remote expense of the city and its car riders. It is, of course, easy to jump to the wrong conclusion when to do so is in keeping with a disposition to pander to public appetite, always willing to believe the worst where corporation activities are concerned, but it is particularly reprehensible to do so in a case in which technical and legal issues are involved. Fairness would dictate that comment adverse to either side be reserved until the matter has been finally adjusted. There will be plenty of time then for censure, if censure of one side or the other is deserved.

Baltimore Decision a Victory for the Skip-Stop Plan

WITH the recent order of the Public Service Commission of Maryland permitting the use of the limited-stop plan in Baltimore comes a notable victory for this plan of operation. The case was one of the most carefully prepared and hardest fought since Cleveland made its sweeping all-day skip-stop installation and ended only after numerous hearings had been held. The plan which was adopted by many electric railways during the war was intended primarily to save fuel. At the end of the coal scarcity many railways reverted to the old system, while others continued to use the new plan for some time afterward. Its popularity waned, however, and at present it is in effect in only a few of the larger cities.

It has been proved that limiting the number of stops speeds up service. Speed is a vital factor today, when so many people in large cities commute from outlying suburban districts. In Baltimore it was shown that for 6,000 car movements of one day there was a saving of more than 18,000 car minutes, or about thirteen car days due to limitation of stops. This saving is greatly appreciated by the car-riding public. Moreover, movement of general vehicular traffic is facilitated under this plan.

The company benefits by a certain reduction in operating costs. For example, it takes more electrical energy to start a car than it does to run it a quarter of a mile. By eliminating useless stops a substantial monetary saving is made. Operating economy is accomplished also by the reduction in the number of cars required to provide equivalent service and by the decrease in maintenance costs of both cars and track.

Practically the only argument against the plan is that some persons are inconvenienced by having to walk farther to reach a car stop. Unless the number of stops per mile is reduced too much, the additional walk required by any patron is a very slight inconvenience and is more than offset by the additional speed and safety obtained. The convenience of the street car riders as a whole should be considered and not the so-called "hardships" endured by a few. Elaborate computations submitted to the Maryland commission during the recent Baltimore hearing showed the average distance walked by residents of typical blocks by reason of the limited-stop plan to be 157 ft., which could be covered in 36 seconds!

In establishing the limited-stop plan, however, wise choice must be made of stops to be eliminated. In business and heavily populated residential districts fewer stops should be skipped, while in outlying districts a stop spacing of four per mile has been found sufficient in some instances. Street obstructions and offsets, bad grades, heavy traffic crossings and intersections where there are traffic officers or signals often are a source of trouble, and opinions vary as to the elimination of stops at such points. Criticism of favoring certain streets can be met by using the staggered system, stopping at certain streets in one direction and at different ones in the opposite direction.

At this time, when traffic congestion is causing an ever-increasing number of delays to street car operation, any practicable method of speeding up the service merits careful consideration. Encouraged by the recent Baltimore decision, other railways may be expected to seek permission for the installation of the limited-stop plan.

Electrolysis Mitigation

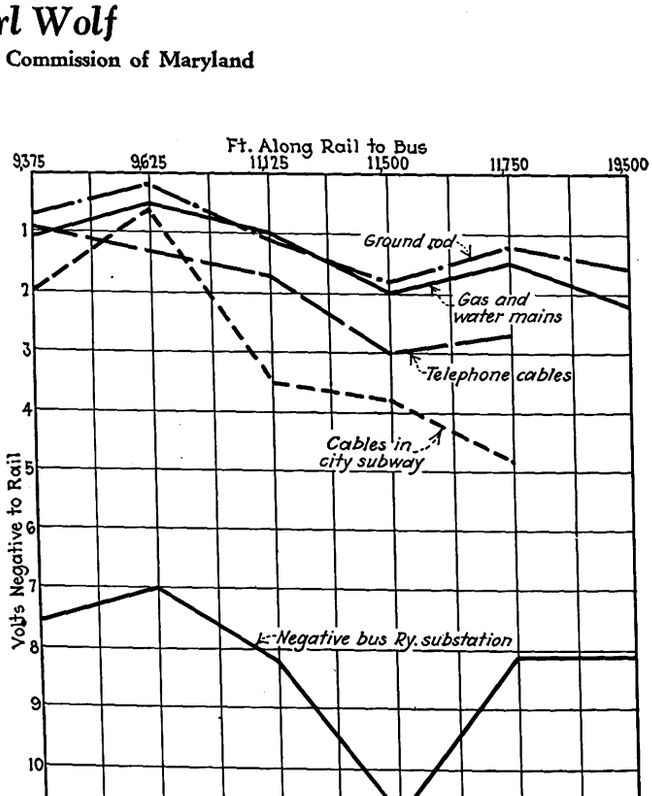
in Baltimore

Surveys made by joint committee representing principal interested parties used as basis for recommendations which have eliminated many causes of trouble

By H. Carl Wolf
Chief Engineer Public Service Commission of Maryland

CO-ORDINATED planning of underground structures, co-operative action on mitigative measures and a pooling of forces for studying conditions and effecting improvement by all agencies in the city interested in the problem have resulted in an actual decrease in the number of failures attributable to electrolysis in Baltimore, even though a marked expansion of underground structures and a duplication of points where electrolytic action might have been expected have taken place. For the past five years the Electrolysis Survey Committee of Baltimore City has been the medium through which just such treatment has been applied. On it are represented three municipal departments, the local railway and an interurban electric railway, a steam railroad, the local gas and electric company, two telephone companies, two telegraph companies, a power company, a pipe line company and the Public Service Commission. The writer acts as chairman. This body has no official standing and no authority to enforce any of its decisions, but the spirit of mutual confidence that has been engendered through the very existence of the committee would make it worth while even if no improvement in conditions had been effected.

The United Railways & Electric Company operates a 600-volt direct-current rail return system with tracks covering pretty generally the streets in the city and extending out into the suburbs in all directions. The Baltimore & Ohio Railroad has an electrified tunnel extending for about 1 mile through the business section and operated at 600 volts direct current. The Washington, Baltimore & Annapolis Electric Railroad has a short stretch of line in one section of the city operated at 600 volts d.c., changing to 1,200 volts d.c. outside of the city limits, where it parallels gas and water mains for several miles. The Consolidated Gas, Electric Light & Power Company operates a 110-220-volt, three-wire, direct-current network in the business section. The electric, telephone, railway and telegraph companies and the municipal fire department have extended systems of underground and overhead cables covering every section of the city, while a water power company has certain transmission feeder cables through a portion of the city. The conduits, with the exception of those used by the Chesapeake & Potomac Telephone Company and the American Telephone & Telegraph Company, are built and maintained by the city through the agency of its Electrical Commission. This system is being rapidly extended, and as conduits are built all overhead wires on streets must be removed. The water bureau and the gas company have comprehensive pipe systems in every direction. The Maryland Pipe Line Company has a short stretch of line through which oil is piped into the city, forming a part of its transcontinental system.



Instantaneous potential readings between railways and other structures

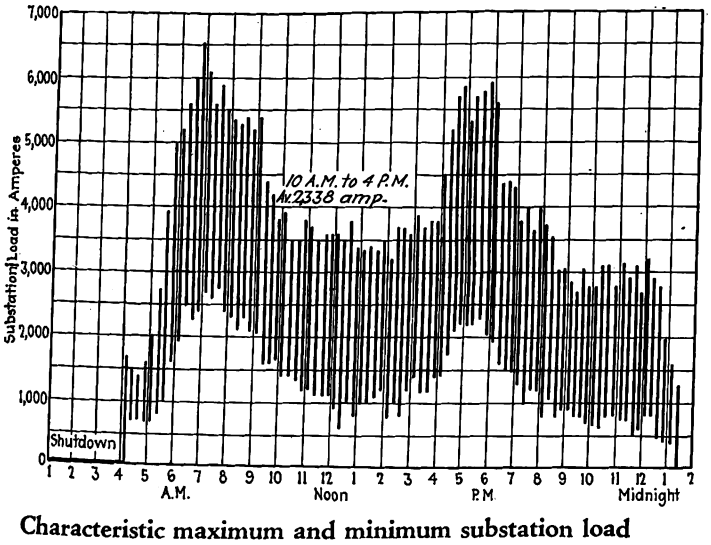
The effect of neighboring structures is reflected in the uneven slope of the curve of over-all potential gradients. Potentials between structures are indicated, as are points where electrolysis faults might be expected.

The first question that presented itself to the committee was whether or not a general survey of electrolysis conditions in the city should be made as a starting point for future work. It was suggested that the National Bureau of Standards be asked to assist in the work and that the cost be borne by the underground-structure-owning agencies in proportion to the amount of equipment owned by each. From a cursory review it appeared that conditions were not as bad in Baltimore as in some other cities, hence it was decided to make first a compilation of all the information collected by the various agencies in the city which had been studying the problem during the past few years. Accordingly, maps were

Digitized by Google

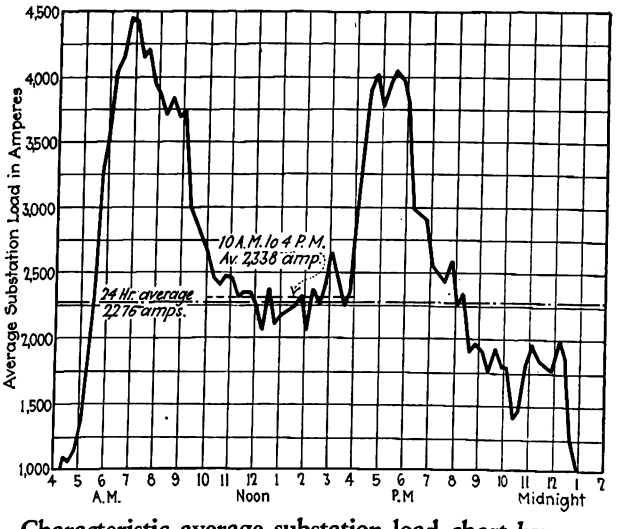
prepared showing potential readings taken during the previous years by each agency and indicating points where failures due to electrolysis had occurred. Other pertinent data were assembled. From these it appeared that there were only two sections of the city in which really dangerous conditions existed, and it was in these sections that practically all failures attributable to electrolysis during the past few years had occurred. Continual changes in the underground pipe and cable systems were causing such rapid shifts in drainage paths and in rail potentials that it was deemed advisable to concentrate on these sections rather than to undertake a comprehensive survey of conditions throughout the city.

A sub-committee was formed, consisting of technical assistants from the water department, the Electrical Commission, the railway company and the gas company, under the leadership of F. T. Iddings of the local telephone company, whose name in this section is synonymous with electrolysis, and a detailed survey begun of one section in the eastern part of the city, in which the worst conditions had been found. The recent joining



Characteristic maximum and minimum substation load chart by fifteen-minute periods

The uniformity of the load between 10 a.m. and 4 p.m. and the small difference between the 24-hour average and the 10 a.m. to 4 p.m. average indicates that instantaneous readings spread over a period of several minutes during any hour from 10 a.m. to 4 p.m. will give a fair indication of average results throughout the 24-hour period.



Characteristic average substation load chart by fifteen-minute periods

together of two previously isolated water systems, the rapid development of all underground systems due to industrial expansion and an absence of comprehensive mitigative measures all pointed to the advisability of the survey in this section. Later other areas were studied in a like manner and mitigative measures agreed upon by members of the committee. Measurements were made of the potential gradient of the rails and the instantaneous potential differences between all structures at strategic points, and these were plotted against the railway loads. In some places where great potential differences were found the current being returned by the underground systems was measured. The telephone company, on its own initiative, has for some years been making a general survey of electrolysis conditions over its cable system, which covers practically the whole city. This survey during the last year was extended to all underground structures in the vicinity of the company's cables. In this way a fair picture of conditions generally was found.

Results of the studies and surveys of the sub-committee are laid before the general committee and made available to all parties concerned. Any recommendations made by the sub-committee are considered and passed upon by the general committee and a method of procedure decided upon. All problems are approached with a spirit of co-operation, and for this reason no vexatious questions tending to halt improvement in conditions nor any problems which were incapable of solution have yet arisen before the committee. Some troubles attributed to electrolysis have been found to be due to other causes. Mitigative measures have generally fallen into three classes—co-operative construction, proper drainage and construction of automatic substations by the railway company.

Before any construction of any importance is undertaken by any company or city department plans are first discussed in committee meetings; where it appears likely that electrolysis conditions will be unbalanced changes are suggested, and where changes appear impracticable mitigative measures are provided for. Studies in the area affected are taken both before and after the construction is completed. The railway has evinced great willingness to supply adequate drainage wires and the other co-operating agencies have freely availed themselves of this privilege. The Electrical Commission has co-operated by making available duct lines for interconnections between structures and for drainage lines as needed. In some cases overdrainage has been found to result, due to shifting conditions. Each of the agencies involved provides a certain amount of drainage for its own system. All of these drainage wires are being made a part of the general drainage system.

The United Railways & Electric Company makes a continual investigation of the condition of its bonds, classifying them as good, defective and open. For the past few years more than 98 per cent of all bonds in the city have been found in good condition. This is a potent factor in reducing electrolytic losses. The company has also adopted a program for the installation of additional substations—all automatic—their locations being worked out as far as possible to improve electrolysis conditions. Four such stations, each of 3,000 kw. capacity, are now in successful operation and others are contemplated for the near future.

Pipe joints and insulating rail joints have caused some little annoyance, due largely to the uncertain con-

Digitized by Google

ditions which they produced before the committee started to function. The removal of insulating joints on either side of a submarine cable and a provision for additional drainage eliminated one case of electrolysis which had been troublesome for years. Cement joints used in gas pipes have been found to result in some flow of current between gas and water pipes; in one case 12 amp. was found passing through a bond in the basement of a residence. It is believed that leadite joints in water pipes cause a very uncertain condition, due largely to the rapid decrease of their resistance with age. At one point insulating rail joints were placed several years ago to protect an 84-in. riveted steel water main which drainage had failed to render negative to earth. It was thought that the earth near the main would be polarized and be rendered positive, but after an extended trial the beneficial effect upon the polarity of the main was found to be negative, while the general effect upon the pipe and cable systems was adverse. The insulating joints were subsequently removed.

Good Results Have Been Obtained by Use of Small Cast-Iron Water Pipe

It is evident that some method for the physical protection of water, gas and underground telephone services which closely approach other structures should be developed. With the rapid expansion of the pipe systems and the meeting of their services with small telephone block cables at very vulnerable points it is not always expedient to supply proper electrical protection to these small ends, yet if either system is better drained than the other, damage is certain to result and remedial measures are hard to apply. The water department is resorting to the use of cast iron for services of 2 in. and over in order to reduce the conductance and the liability to damage. It is true, of course, that damage to services and block cables is not as serious as that to feeder and transmission systems, but it can, nevertheless, be very troublesome.

The many failures that occur as a result of conditions which have been existing for years make it apparent that the results of the committee's work cannot be measured for some time to come. Certainly it is true that Baltimore is remarkably free of electrolysis troubles, but it is the aim of the committee to effect even greater improvement, inasmuch as the damage done by electrolysis is in no way measured by the number of failures which occur. The co-operative method which has been the rule in Baltimore for the past five years ought to commend itself for the attacking of this vexatious electrolysis problem in other cities.

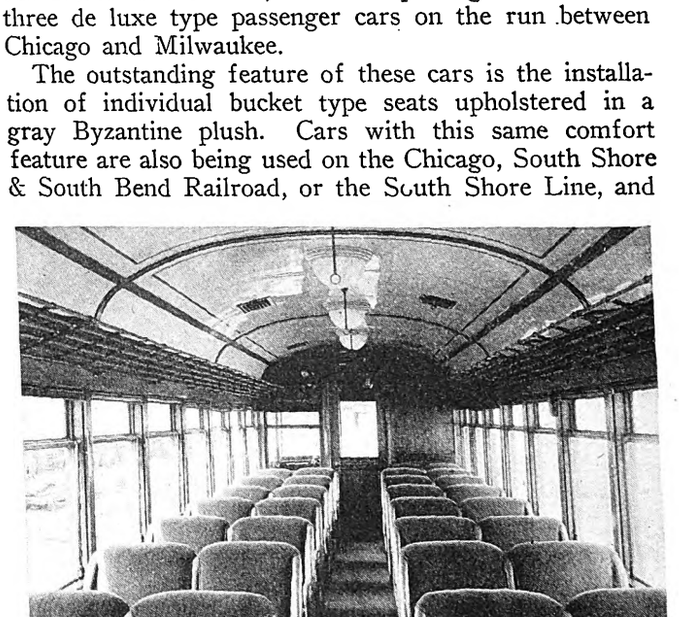
Atlanta Employees Own Homes

SOME 32.6 per cent of trainmen employees of the Georgia Power Company, Atlanta, Ga., own their own homes, according to a recent survey. One trainman, the survey revealed, worked for years paying for a home. A few days after the last payment had been made it burned down. Undaunted, he built a brick bungalow on the site of the old home and is now paying for it. Another trainman has eleven houses in the city which he rented for a good income. Practically all of the home owners bought or were buying their homes on time.

De Luxe Cars Placed in Service on North Shore Line

WHAT is another innovation in riding comfort for passengers at regular rates has been introduced on the Chicago, North Shore & Milwaukee Railroad, the North Shore Line, with the placing in service of three de luxe type passenger cars on the run between Chicago and Milwaukee.

The outstanding feature of these cars is the installation of individual bucket type seats upholstered in a gray Byzantine plush. Cars with this same comfort feature are also being used on the Chicago, South Shore & South Bend Railroad, or the South Shore Line, and



Type of de luxe appointments placed at the service of patrons of the Chicago, North Shore & Milwaukee Railroad. Three cars thus fitted are now operating between the terminals

delivery of similarly equipped cars to the Chicago, Aurora & Elgin Railroad was scheduled for August this year.

Each car has 51 individual seats. Interior decorations are of natural mahogany, with white headlining. The main compartment floor is equipped with battleship linoleum. Cut off from the main compartment in each car is a smoking compartment, with flooring of rubber tiling.

All the units are equipped with motors and embrace the latest safety devices. Both electric and hot water heating systems are installed, with thermostatic control for maintaining an even temperature in cold weather. Auxiliary battery lamps insure proper illumination at all times. Another feature is the painting of the exteriors in light shades for the purpose of making visibility tests. The predominating color is orange, with green and brown trimmings, largely reversing the present color scheme of green bodies and orange trimmings. Officials of the company are making these tests with a view to ascertaining the color scheme which will insure the greatest measure of safety in operation.

"Placing of these de luxe passenger cars in service is in keeping with the policy of the North Shore Line to give its customers the best possible service," said General Manager John F. Egolf. "Our aim is to combine speed of operation with the utmost convenience and comfort for our customers."

No-Report Claims the Bane of the Claim Department

By Seth W. Baldwin
Attorney the Connecticut Company, New Haven, Conn.

IN STREET railway parlance a "no-report" claim is one made against the railway about an accident which has not already been reported to the proper officers of the company by any company employee. It is the despair of the trial attorney of the company and a bane to the claim department. It is also an enigma to the safety department and supervising force.

Safe practices are often worked out upon the basis of information derived from accident statistics, but statistics upon no-report claims are about as solvable as a Chinese cross-word puzzle.

There may be the accident which should have been reported, but upon which no claim is ever made. Obviously this should be included in accurate statistics, but never is. There may be the accident which first comes to light when suit is brought against the company and, depending upon the statute of limitations, this may be as long as six years after the accident. Thus the time element enters to confuse the situation. The claim may be entirely "faked" or greatly exaggerated, so that its statistical value is impossible of determination.

It is therefore almost impossible to deal with this no-report problem on a strictly statistical basis. It can be attacked only from the standpoint of personal instruction and personal contact.

New employees must be taught the great importance of reporting all accidents on or near their cars or work, and this same thought must be kept ever present in the minds of the older employees.

It is a well-known principle that the interest of a "boss" in any particular matter keeps the attention of the men whom he is supervising directed upon that same subject. This is true all the way through an organization, through the small groups, and up to the president and his staff. The no-report claim situation is of enough importance so that presidents of street railway companies should be interested and obtain and use all of the statistical information available.

Depending on the size and make-up of the company, this may be done by monthly reports, prepared by the general claim agent from information furnished him by his divisional claim agents and forwarded to the president through the proper channels. A sample monthly report may be as follows:

Dear Sir: I list below "no-report" claims for the month of , 1927:

Division	Number Brought	Number Settled	Cost
A	1	0	0
B	5	4	$187.00
C	0	0	0
D	0	0	0
E	2	1	20.00
F	0	0	0
G	0	0	0
H	0	0	0
I	0	0	0
J	2	1	4.00
K	0	0	0
Total	10	6	$211.00

Richard Roe,
General Claim Agent.

By this system each divisional superintendent, in cooperation with his divisional claim agent, knows his own situation in this regard, and also that even in the president's office comparisons are being made.

For instance, in the report given, Division B would undergo some questioning for its bad showing.

No-report accidents are of two kinds. There is the accident which some employee observes, or ought to observe, and does not report, and there is the accident which is unobserved by an employee, and properly so.

In the first kind, if the employee who should have reported the accident can be located, further special instruction, reprimand or discipline should be administered as circumstances warrant. The particular crew involved may often be found from the description of the claimant, as to time, place, car number, personal appearance, etc.

In the second kind there is no fault, so no blame should be placed. At times, through unusual circumstances, an accident of this nature is reported, and when this occurs, unusual praise should be awarded. I have in mind an instance where an intending passenger ran across the track behind a moving southbound car and also behind a slowly moving northbound car and fell in attempting to board the latter. The position of the conductor of the northbound car was such that he could not possibly see the accident, and as there was no outcry he was unaware of it. The conductor on the southbound car just happened to see the incident, signaled his car to stop, ran back more than a block and obtained the information for a report, including witnesses' names. He deserved and received special praise.

It may be said that the reduction of no-report cases is more of a financial than of a safety matter. Comparatively speaking, this is probably true, but one side of it has a material bearing upon service and safety. The attempt to reduce the number of no-report cases is basically an attempt to make all employees thoroughly honest, and there is no better basis upon which to build safety and service than a thoroughly honest group of workers.

In this regard, a word of warning is needed to any safety workers who have their eyes so intently focused upon safety as to miss other essentials of service. In safety work it has become customary to stage various kinds of contests based upon the results of reported accidents. The desire to win the contest is sometimes so great as to lead contestants to attempt concealment of accidents in which they may become involved. This not only creates no-report cases but makes the foundation of the whole contest dishonest. If the men in the contest learn about it—and the chances are that they will before the judges do—the respect of the sincere and honest employees for the safety contest will be lost. If safety contests are undertaken extraordinary care must be exercised to see that each and every accident is reported.

Perfection is rarely attained in this world. However, that does not prevent street railway companies from doing their best to reduce the number of no-report accidents. The best suggestions toward this goal are, first, thoroughly to inform the new employees of the importance of reporting every accident and every incident which a claimant in his greed may exaggerate into an accident, and, second, have the whole organization, from the men up to the president and from the president down to the men, constantly realize that while this is a very small part of their work, as far as time is concerned, it is really of very great importance to the company.

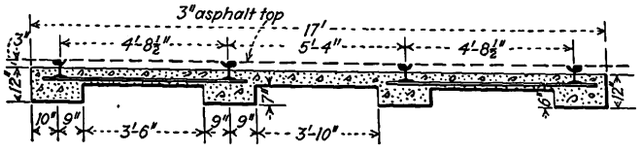
Track Cost Reduced with Steel Ties

By W. S. Tabor
Engineering Department, Alabama Power Company, Birmingham, Alabama

STUDIES of street railway track construction and paving made by the Alabama Power Company in 1926 resulted in the development of new designs which are less expensive than those formerly used. The present standard type for ordinary track is suitable for any rail section and may be paved with granite block, brick, asphalt or concrete. In most of the cities where this company operates street railways solid concrete paving is preferred by the city engineers.

For ordinary track we use a thin steel tie with patent clips formerly used for light rails and narrow-gage mine and industrial open tracks. When ties are imbedded entirely in concrete, they function only in a horizontal position to hold the rails to gage and the vertical loads are carried entirely by the concrete. The section of steel we use is $\frac{3}{16}$ in. thick corrugated to ¾ in., 5 in. wide by 6½ ft. long. This shape allows easy access to place the concrete underneath. The rail fastenings are the out-

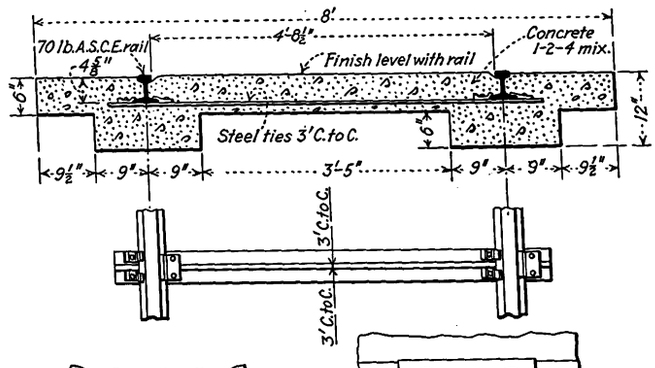


Design for double track in city streets where traffic is heavy

standing feature of the tie, being always in place and ready for use. Stationary clips are placed on the inside and revolving clips on the outside of the rail. By welding a tie to rail at proper intervals it will serve as a cross bond. This tie is manufactured by the Bethlehem Steel Company. Its weight is 26 lb. and it can be punched to fit any rail section. We constructed some of this type in 1926-27 with gratifying results both as to cost and appearance, using 70-lb., 80-lb. and 85-lb. A.S.C.E. rail, also some 90-lb., 7-in. grooved girder rail.

The usual practice followed in construction for 70-lb. A.S.C.E. rail is to excavate a trench 12 in. deep and 18 in. wide centered on each rail, and a section of 9 in. outside of each rail 6 in. below finished paving, also a center section 6 in. deep by 3 ft. 6 in. wide. When the ground will not stand by itself, form boards are used in the trench. Excavation being completed, rails are placed on wood blocking, ties are attached and the joints are welded, then surfaced with hardwood wedges and nailed to blocks, which are left in place. The concrete is a 1:2:4 mix, using Portland cement. This is poured in one course and thoroughly tamped under ties and rail. Our rail joints are thermit-welded on compromise joints at special work and electric seam-welded elsewhere.

One of the first stretches of the above type constructed was 2,600 ft. of single track, the street gradient being a series of vertical curves approximating 8 per cent grades. A.S.C.E. 80-lb. rail was used. This work was carried out under exceptionally favorable conditions, suspension of traffic and fair weather. The actual construction cost was 30 to 40 per cent lower than types previously used. The writer recently made an inspec-

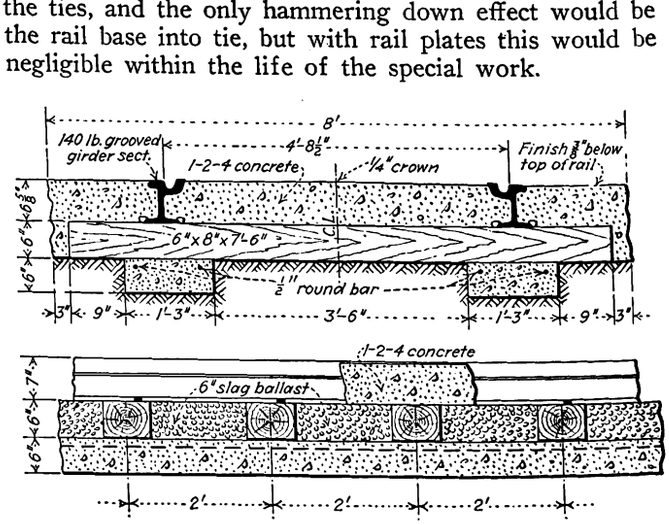


Standard track structure of Alabama Power Company is suitable for any rail section and block, brick, asphalt or concrete paving

tion of the above track and found it in perfect condition, cars riding smoothly and no perceptible difference as to noise, as compared with other types of construction. Indications are that maintenance costs will not worry the operating department for a long time to come.

The principal saving is due to the low cost of the tie and the simplicity of the track installation, which cuts labor cost and requires comparatively little excavation. Ties are placed on 3-ft. centers and the requirements for 1 mile of single track are 22 gross tons, while other types of steel ties commonly used ran 72-122 gross tons per mile of single track. The cost is also lower than treated wood ties with ballast underneath and concrete or brick surfacing.

For special work in connection with the above construction we are using mainly 7-in. GG 140-lb. rail section with treated wood ties laid on reinforced-concrete girders placed directly under the rails and a slag ballast filler or base for subgrade of paving slab, as shown in an accompanying drawing. The cost of this type is no more than ballasting under the ties and tamping and is more substantial. A settlement of the ballast invariably occurs when ballast alone is under the ties, allowing the rail to drive downward through the surface paving, causing fracture along the rails with early disaster to the paving. The concrete girder gives a solid support for the ties, and the only hammering down effect would be the rail base into tie, but with rail plates this would be negligible within the life of the special work.



Wood ties on reinforced concrete girders are used under special work

Overhead construction used on some double-track sections

Electrification of Swedish State Railway Extended

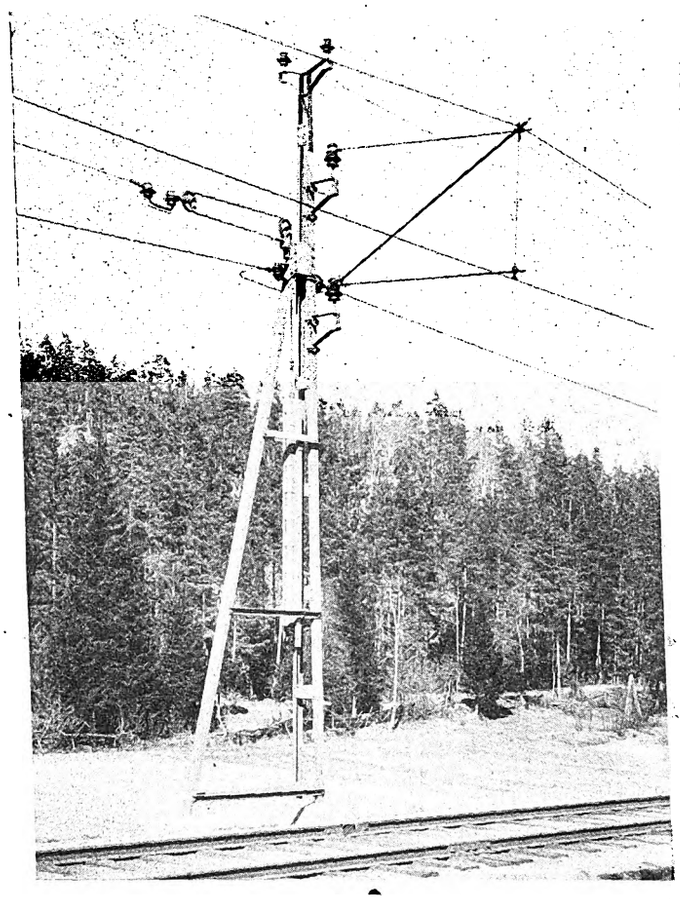
By Kent T. Healy
Consulting Engineer, Natick, Mass.

THE recent electrification of the Swedish State Railway between Goteborg and Stockholm is a most significant development in the field of electric trunk line operation. It represents a very satisfactory solution to some of the major problems confronting the distribution of power at high trolley voltages and shows a high degree of design technique in the distribution system.

Hitherto it has not been considered feasible or advantageous to operate a high-voltage single-phase distribution system from a commercial high-tension power system. The Swedish State Railway was desirous of keeping the number of substations to a minimum and the amount of copper as low as possible, so that it preferred a high trolley voltage, such as 16,000, the standard in Europe for single phase. But the single-phase locomotives required a low frequency, while the commercial power system was 50 cycles. This necessitated frequency converters at the substations, which would also perform the phase conversion. Similar conversion would be necessary with direct current and the substations would have to be a good deal more frequent due to the lower distribution potential of 3,000 volts, and feeders would be necessary, so that as far as distribution economics was concerned single-phase distribution seemed to be the best. The other alternative was to build a single-phase transmission system, as was done on the northern section of the railroad. This, however, did not seem to be sound economically in the case of the Stockholm-Goteborg section because of the existing transmission net, which could readily supply the power and which could be aided considerably by bettering the load factor and regulating the voltage at various points.

The result of the decision to use the commercial system for power was the installation of five substations fed from existing transmission lines to supply power for 270 miles of railroad. These substations are built in units, with a 3,200-kva., three-phase, 50-cycle synchronous motor directly coupled to a 2,400-kva., single-phase, 16⅔-cycle generator. On the motor side is a Tyrell voltage regulator, varying the field of the motor so as to feed necessary reactive amperes into the transmission line to correct its voltage. The unique feature of the low-tension apparatus for single-phase distribution is the arrangement in case of a short circuit or ground on the line. The feeder oil switch is set to open at

Digitized by Google



Lever arrangement for changing tension

450 amp. instantaneously. After opening, it closes back on the line in 30 seconds through a series current limiting resistance. If there is still a short it closes in again after a two-minute wait, and then remains open if the line has not cleared. Oftentimes, due to the high impedance of the line, a short circuit will not raise the current to that initial value, yet it is necessary to keep it set as high as that because of the possible demand for that much power by locomotives in the section. To circumvent this difficulty a low voltage relay is installed in the feeder, which lowers the opening setting of the current relay when the voltage on the feeder drops below a certain point. Normally the feeder voltage is regulated by a Tyrell regulator on the single-phase generator to remain at 16,000 volts.

The substations have two or three motor-generator units tied together by buses on both single and three phase sides. Each station feeds up to three sections of line. The operation of the equipment is automatic to a large extent. For starting the motor-generator a low-voltage bus is provided and for synchronizing a pole changer with six settings is used so as to get the proper phase relation on the single-phase side.

The track distribution system has a very interesting design. It is non-ferrous with a copper messenger of 98,000 circ.mil supporting a contact of copper of 156,000 circ.mil with copper hangers and brass and bronze fittings. The catenary is built in sections of 4,900 ft., fixed in the center and flexible longitudinally either way, being kept in tension at both ends by weights and levers so as to keep a tension of about 880 lb. in the messenger and 1,320 lb. in the trolley. With the expansion and contraction in summer and winter the position of the weighted ends of the catenary may vary as much as 3 ft. The stresses in the messenger and contact are kept uniform by an ingenious lever arrangement changing the proportion of the tensions given to one or the other as its length varies. The normal span length is 195 ft., with a flexible Z support at each pole or bridge location. This Z support is made of pipe and wire supported on two pin insulators and free to move around these as an axis. With cross-beam construction the support remains flexible, but is a little more complicated. No cross spans are used to support the catenary because of the greater security offered by the cross beams. For sectionalizing on high-speed tracks, air gaps are used, but in yard tracks an insulator section breaker with a metal wire running surface is used.

Current collection is performed by an aluminum shoe pressing with about 8 to 10 lb. pressure on the contact wire. The pantograph is designed very lightly and the shoe is attached to a small part of the pantograph at the top, free to move independently of the main body. This allows the shoe to follow the smaller irregularities of the contact wire nicely, so that there is very little sparking and a high pressure is not necessary to keep the shoe on the wire and collect sufficient current. With this low pressure, wear on the trolley is negligible. To avoid wearing out the shoe in one place the contact wire is run in a zigzag line, varying first on one side and then on the other side of the center line of the track as it goes from pole to pole.

The locomotives are extremely simple, the same model being used for freight and passenger service, with a variation of gear ratio. There are two motors, totaling 1,660 hp., geared to a jackshaft, which in turn delivers power to three drivers through the usual rods. The general characteristics of the locomotives are given in an accompanying table.

The electrical protective features of the locomotive are unique in that they are arranged to co-operate with

DIMENSIONS AND CHARACTERISTICS OF LOCOMOTIVES

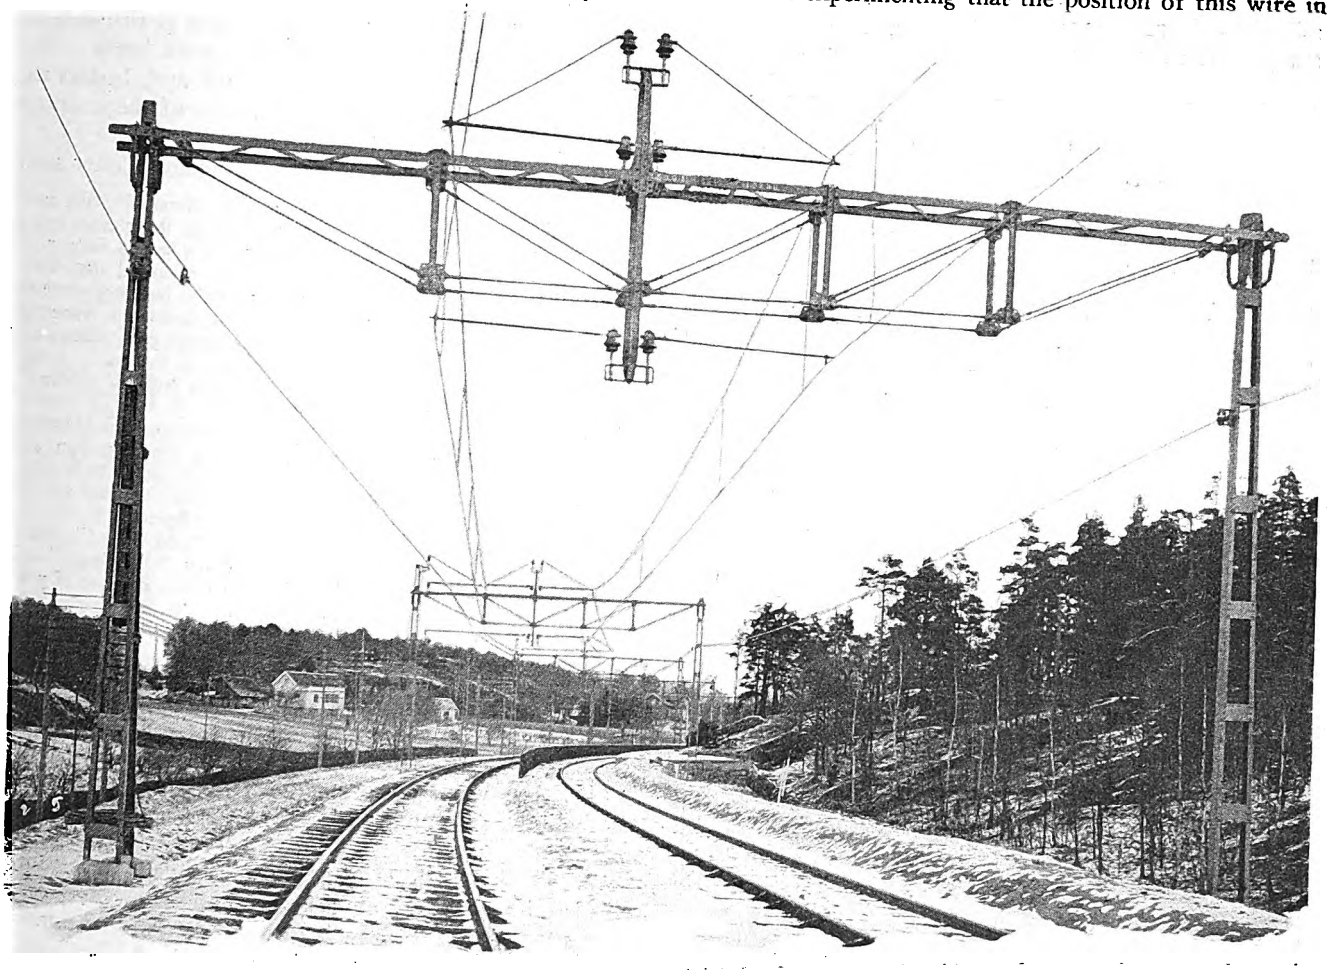
the feeder protection in the substation. The circuit breaker in the locomotive opens instantly on any short up to 200 amp. Above that it stays closed and waits for the feeder breaker in the substation to open. When the voltage drops to zero in the locomotive due to the feeder breaker opening, the breaker on the locomotive opens and clears the locomotive from the circuit, so that when the feeder breaker in the substation recloses the short is cleared off the line and the rest of the trains merely notice a short interruption of power for 30 seconds.

One of the outstanding features of the electrification from Goteborg to Stockholm has been the very satisfactory solution of the problem of telephone inductive interference.



Truss construction with double and separately insulated outriggers

The Swedish State Railway has been at work for a long time on this problem on its northern electrified section. The first steps there were the installation of a system at a 16,000 volts negative to that in the trolley to counteract potentials induced statically. This was worked out in conjunction with a transmission line for station lighting, but there were decided disadvantages in this method because of danger in case of insulation failure. In addition to this the rails were bonded and booster transformers with one coil in series with the rail circuit were installed. These boosters reduced the dynamic induction from 13 volts per 100 amp. per mile to 0.5 volts. However, with this series coil connection bonds were required and trouble was experienced in voltage drops in rails getting too high.

With the new system booster transformers were used at the ends of sections of the return wire and the rails bonded to this wire at the midpoints of the sections. This connection eliminates the need of bonds and keeps down rail potentials. The transformers are a one to one type with a voltage of 570 in the primary, corresponding to 2,200 amp. in the secondary. They weigh about 5,000 lb. The core iron is specially selected to prevent losses and to keep the magnetizing current as low as possible. With the capacity of the transformers high enough they can take care of the abnormal conditions of shorts very well. The return wire is a 257,000-circ.mil copper cable hung on the poles at the base of the lowest insulator of the catenary support. It was found in experimenting that the position of this wire in the vertical plane made considerable difference in the efficiency of the reduction of the induction. Tests in certain sections of the line with this arrangement of return wire and boosters showed 0.16 volts per amp.-mile induced in an open wire line averaging 1,300 ft. away from the track and 0.24 in a cable line 4 ft. away buried in the ground. All the communication circuits of the railroad have been cabled and buried. The commercial circuits too have been cabled and removed to highways. The railroad has had to stand two-thirds of the cost of all this, amounting to about $4,000,000.

The total cost of the electrification has been about $11,000,000 for 270 route-miles. Of this 11 per cent was for the substations, 34 per cent for the track distribution system, 28 per cent for the prevention of telephone interference and 28 per cent for the rolling stock. The substations averaged about $242,000 each, the catenary and supports $7,500 per track-mile and the locomotives $60,000 each.

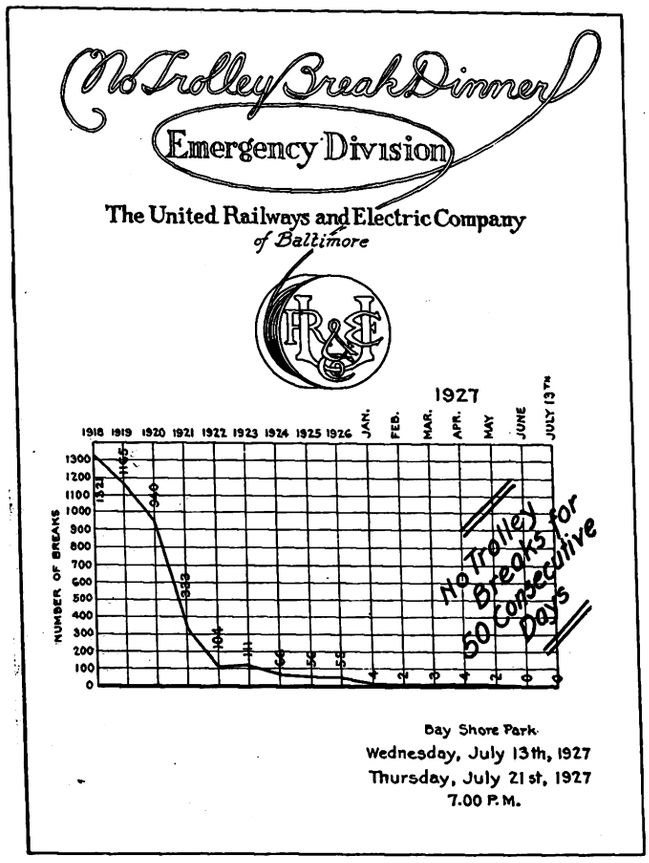
Trolley Break Record Made at Baltimore

In recognition of having gone 58 days without a single trolley break, a dinner was tendered to the men of the emergency division

FIFTY-EIGHT days and nights passed without a single break in the overhead trolley wires on more than 400 miles of line operated by the United Railways & Electric Company, Baltimore, Md. During that time 1,067,000 trips were made and the cars traveled 5,500,000 miles. This result was accomplished by a most exact study of the mechanics of the trolley, the trolley wheel



Cover of menu card for celebration dinner

and the wire and vigilant supervision, together with unceasing inspection of the overhead work.

There was a time when fallen trolley wires were so frequent that they were regarded as a necessary evil, the delays resulting costing many dollars. At that time trouble crews were stationed at advantageous points from which to respond with their trucks when news of a trolley break was phoned in. Now these crews have a more important function, which is the forestalling of trouble so as to prevent its occurrence. They have headquarters with some one on duty to receive reports and calls and forward them to the crews. These latter, however, are out on the line covering the whole system in systematic order, inspecting the overhead work and detecting any weak points which need replacement and strengthening. The record of trolley wire breaks for the United Railway system since 1918 is given in the accompanying table.

TROLLEY WIRE BREAKS ON UNITED RAILWAY & ELECTRIC COMPANY'S LINES FOR TEN YEARS

Year	Number of Trolley Wire Breaks	Year	Number of Trolley Wire Breaks
1918	1,321	1923	111
1919	1,165	1924	66
1920	940	1925	56
1921	333	1926 to	55
1922	84	1927 to July 21	15

When the month of June went by without a single break in the trolley wire, it was decided to give a dinner to the men of the emergency division. In order not to interfere with the division's work, the force was split into two groups and each group was banqueted on different dates. The first dinner was held July 13, and at that time 50 days had elapsed without a single break. The second dinner was held July 21 and at that date 58 days had elapsed without a trolley wire break. The dinners were given at Bay Shore Park and, besides the men of the emergency division, officials of the company were present.

Speaking of the record, General Manager Potter said:

> We are now calling you the "emergency division." We used to call you "trouble shooters." But neither of these titles seems to fit you. Mr. Wennagel tells me we have gone 58 days without a trolley break. I think this is a better record than Babe Ruth's 30 home runs, because Babe gets to the bat only three or four times each game, and probably does not average a home run more than once in two or three games, whereas you fellows are going to the bat 24 hours a day, every day in the year. I cannot call you "pinch hitters"; I cannot call you "trouble shooters," and I cannot call you "emergency men."
>
> They tell me that Napoleon used to win battles by anticipating any trouble that the other fellow was trying to cause him, and then acting before the other fellow did. That seems to be what you are doing—anticipating trouble—and that is what we are doing in the street railway game all along the line.
>
> Napoleon's prize regiment was called the "Old Guard." From now on you are entitled to call yourselves the "Old Guard," and I wish I could pin a Distinguished Service Cross on each of your chests. We are all proud of you.

More Steel Cars in Rapid Transit Service in Brooklyn

THE last wooden car has been taken from operation on the Brighton Beach line between Prospect Park and Coney Island. An all-steel service is now being given. The Brooklyn-Manhattan Transit Corporation replaced its wooden car service with steel car service at the request of the Transit Commission, after a number of conferences at the commission offices beginning June 6. The wooden car service was operated in the evening beginning at 4:15 from Franklin Avenue and Fulton Street to Coney Island over the local tracks. The operation continued up to 6:15 p.m. In the opposite direction; that is, from Coney Island to Franklin Avenue and Fulton Street via Prospect Park, the wooden service was begun at 3.42 p.m. and continued up to 5:42 p.m. This service resulted in a mixed operation of steel and wooden cars over the same tracks, which tracks are not completely equipped with an automatic train stop device.

The commission has directed by formal order both the Brooklyn company and the Interborough Rapid Transit Company to equip their entire systems with automatic train stop device and the companies have accepted the order. Until the tracks are thus equipped and until it is determined whether or not a steel car of sufficiently light weight can be designed for operation on the elevated structures the commission is endeavorinng to put an end to wooden car operation wherever this can be done without seriously curtailing service facilities.

You've Got the Goods—

Now Sell 'Em

When a railway has laid the groundwork for telling the world about its product by up-to-date, attractive cars and service, it is up to the trainmen personally to develop potential riders into actual customers

By C. S. Stackpole
Sales Manager Light and Power Department
Virginia Electric & Power Company

YOU have spent lots of time and effort bringing our transportation service up to the point where it is safe, plentiful, regular, fast, clean and comfortable. You fellows have been the artists—a wonderful job has been done in a remarkably short time through the close co-operation and association of the old and the new. The painting is great. Now the picture must be sold. A demand must be created for it. Let's tell the world about it through salesmanship.

It is said, you know, that salesmanship is nothing more than spreading the gospel of personal belief. Once you feel the strength of conviction in your blood, you're out telling the world, and the force with which you tell your tale determines the value of your service as the bearer of good business tidings. There are two major factors of prime importance which must be considered in selling transportation. First, advertising; second, personal solicitation and salesmanship.

A corking job is already being done in advertising with the attractively painted street cars carrying attention-getting slogans, the excellently worded newspaper advertisements, pithy car cards asking patrons to "Rest, Ride and Relax" with you, but there you sort of come to a stopping place.

How many of you fellows in your travels have come out of a railroad station in a strange city and (assuming you're not on expense) desire to ride the economical way, by street car, to the center of the city? Lots of you, I'll bet. You find your way out of the station and behold there is a double-track trolley service and you have to find a friendly policeman or bystander to tell you which track the car for the business district runs on. Isn't there some way that a sign could be placed designating the spot where the downtown trolley can be taken, thus breaking down the resistance which causes the stranger more times than one to use a more expensive mode of transportation to save the trouble of inquiry? I believe it would be worth-while advertising. The sign might read, "Ride the Economical, Comfortable, Fast Way, by Street Car, Ten Minutes (or whatever it may be) to the Center of the City— Take the Car on This Side." You'd get many a transient now being missed.

Word-of-mouth advertising is used with great effect in many cases. We have the side show barker, the old quack medicine man, radio performers, and last, but not least, the taxicab driver. You are all familiar with the "Cab, cab, taxicab, mister! Anywhere you want to go," which may be heard in almost every city in the country. The taxicab driver is an aggressive advertiser and salesman. He sells you so thoroughly that if you are a timid soul you are almost shamed into buying his services. I do not believe that you would want to train your inspectors to yell musically "Street car, street car, street car, mister, ride the economical way." That's rather a mouthful, but wouldn't it be practical to have men whose duty it would be to meet all trains at stations, wearing somewhere on their uniforms, and easily seen, probably an embroidered statement worded something like this, "Ask Me About Street Car Service"? Their jobs would be similar to those of the floorwalkers in up-to-date department stores—who provide easily accessible information but ultimately, through their courteous and peppy manner, help sell more goods.

The greatest selling houses in the country today use what is known as the premium or gift idea to attract buyers to their places of business. Let's give some thought to this in selling transportation. A tiny replica of the street car with our insignia stamped or painted

MR. STACKPOLE talks to the railway men of his own company and gives his views on winning and retaining car riders. He was invited to address the transportation club, a study organization of the company, on "What Electric Railways Could Do to Sell Transportation." He prefaced his talk with a confession that these ideas were gathered in more than a year and a half of riding street cars over the Virginia properties, and with an admonition that some of the things would "smack" of the salesman "that just won't be kept down."

Digitized by Google

on it could be made, no doubt, for very little money. Why not pick out a certain day or days when every child between the paying age and ten years, let's say, who rides in the street cars during that period would be given this toy? Wouldn't that bring street car riding to the minds of the parents and at the same time please the child who is father of the man, who may help or hinder us in later years?

Direct literature contact is often compelling when used properly. Why wouldn't it be possible from time to time to use an attractively worded transportation pamphlet to be delivered with our light bills? Doubtless there are innumerable people who use their automobiles wholly for city transportation who are too busy driving their cars to read our cards and suggestive signs painted on the sides of the street cars, yet they might be sold on the convenience and economy of using our service if they received informative pamphlets in their homes.

Suggest House-to-House Calls by Trainmen

You may say that personal calls are all right for selling vacuum cleaners and electric irons, but not street car rides. Let me explain. When you open a new line, an extension of an old one, or put on the newest and most up-to-date equipment, what do you do? You advertise in the newspapers and have a parade of the new equipment. This is invaluable, but why not go a step further? Take a group of men who are outstanding in their appearance and personalities, give them a course of instruction and have them personally visit every home possible on the new line to explain the advantages of the service. Shortly, you will have the sensible persons saying, "There's a modern transport concern, so well sold on what it has to offer that it is soliciting my business!" A similar scheme could be worked out among the business houses that employ messengers, errand boys and others whose duties carry them all over the city.

Laborless Equipment Encourages Operator of the Salesman Type

Now we come to the personal salesmanship which covers a lot of territory. To make its use effective depends entirely on the little personal services rendered by the man behind the controller. We all remember when the operator of a street car had to be a great big bruiser, bulging all over with muscles in order that he might have the physical strength to hand-brake cars, open and close doors, and perform all the other heavy physical duties necessary. Today, electricity and air do all of these things. Comfortable seats also are provided for the operators to make for less fatigue and, therefore, less grouchiness. In other words, the stage is set for a real selling job.

Let's Check the Patrons' Parcels When We Can

All of you fellows probably know why the large department stores have started checking stations for customers' bundles and babies. It has been done indirectly to acquire good will, but directly to attract more prospects into the store and thus sell more goods. Their opportunity is ours in a little different way. When a patron, laden with bundles or luggage boards a car, let's get his mind away from his burdens in the very beginning by having the operator-salesman suggest the bundles be left on the floor in front. The rider may then go back and sit down comfortably without having a struggle finding room for his baggage. Some may protest: "But that places too much responsibility on our men." So it does with the department store employees, but apparently enough is thought of the selling value of the idea to keep on even though a bundle or a baby is lost occasionally. Anyway, I haven't yet suggested that we check babies.

I wonder if you fellows ever looked at that safety sign on our cars "Do not talk to the operator" and thought, assuming you were a passenger, "Well, if I can't talk to him, who in Hades can I talk to?" Just suppose a store had signs over the salespeople's heads reading, "Do not talk to the salesmen; see the floorwalker." You can imagine how long that store would remain in business. But that is absurd and not a fair comparison, you say—yet here we are asking our salesmen to keep quiet while opportunities may slip by. I appreciate the safety factor in the ruling, but when the car is in motion he can very easily keep his head to the front and very few will talk to him while the car is moving; at least, no more than at present, in spite of the sign. As a substitute for the present mandatory wording, I suggest the new very popular "Ask me another," or words to that effect.

The Thousand-and-One Touches That Count

And so I might ramble on for hours, suggesting many more little things, such as calling out the names of streets; assisting the old and infirm in boarding or getting off the cars; slowing down, when the car is full, to tell waiting passengers that the next car is coming right behind. Suggesting to the customer that a weekly pass is handy and economical; always smiling, neat, courteous, willing; thoroughly sold on the company, its ideals and its debt to the good folks who are its patrons.

It is always the little things that our customers see and criticise, favorably or unfavorably, according to the actions of our people. What a great thing it would be if we could get our men into a selling attitude so that they would actually feel conscious-stricken when they see people walking as an empty car rolls by. Why not take them even more definitely into the picture and get them to thinking "What can we do to sell more rides?" If more concentrated training and instruction along these selling lines are needed, wouldn't it be practical to employ an enthusiastic, imaginative, convincing, promotional director, with loads of personality, to sell these fellows on the opportunities their jobs present? It seems to me he would certainly be a distinct asset to the company.

We Should Be Salesmen Primarily

Now let me close with a rearranged version of our Mr. Lemmon's closing remarks in an address made here in Norfolk a little over a year ago on "The Universal Advocation—Salesmanship." At that time he said:

We are not in the business of manufacturing B.t.u.'s, car-miles, tons of ice or mousetraps, but of selling them at a profit.

Every man on the payroll from manager to vehicle operator is a salesman or an assistant to a salesman. He is there for no other purpose whatever.

Salesmanship, as distinct from peddling, calls for imagination. It creates new demands for old things.

There can be no sale—under any circumstances—without an appeal to one of the seven emotions to which the human mind is capable of reacting.

Unless we know more about the other fellow's needs than he does, and can point them out to him, there is no reason to suppose that he will part with real money for something he is unaware of requiring.

The names of the company, the personality of the employees, and the service which we render, must all be associated with pleasant pictures in the minds of our potential customers.

You say, "of course all of these things are obvious." True, but the rarest thing on the face of this earth today is timely recognition of the obvious.

Nashville's New Cars

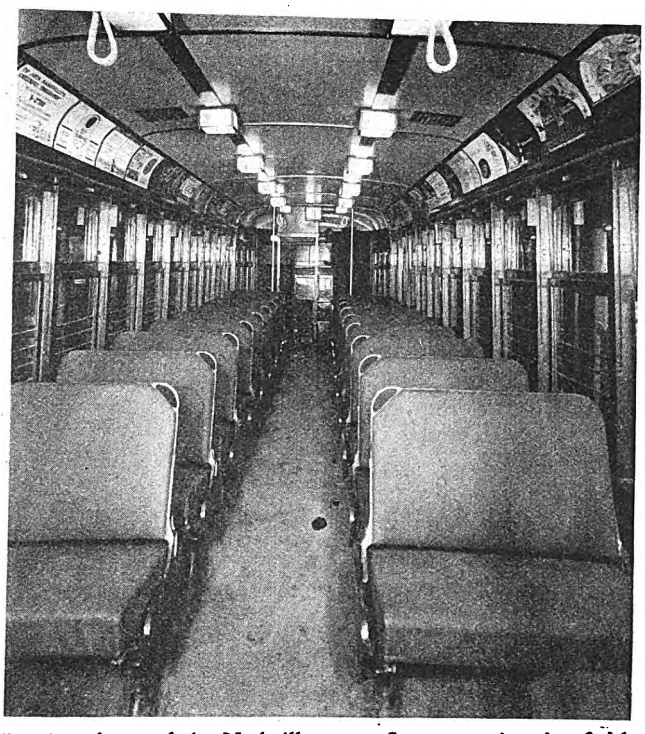
Features of the ten light-weight cars recently placed in service by Nashville Railway & Light Company at a cost of $150,000

WHEN the ten new de luxe street cars ordered by the Nashville Railway & Light Company were placed in service last fall the event was properly celebrated by an elaborate historical pageant, together with a motion picture display. The story was told in ELECTRIC RAILWAY JOURNAL for Dec. 4, 1926, page 1019, and Dec. 25, page 1139. Bought from the Lightweight Noiseless Electric Street Car Company, Minneapolis, these cars represent an investment of $150,000, which is the initial step in a program of modernizing the company's rolling stock. The cars were placed in service on the West End-Bellemeade division.

The low streamline body, arch roof and wide windows make the car attractive. A drop skirt extends around the bottom of the car body, partly concealing the trucks and wheels and reducing the noise made by the running gear. Double floors with a layer of wallboard between and a covering of olive-green battleship linoleum also aid in the suppression of noise.

The cars have double trucks and are of the one-man type. Fully equipped they weigh 29,000 lb. each. The dash is low and the fare box and a spring-cushioned seat are designed for the convenience of the operator. Easy access is provided through the use of 26-in. wheels and wide entrance and exit doors.

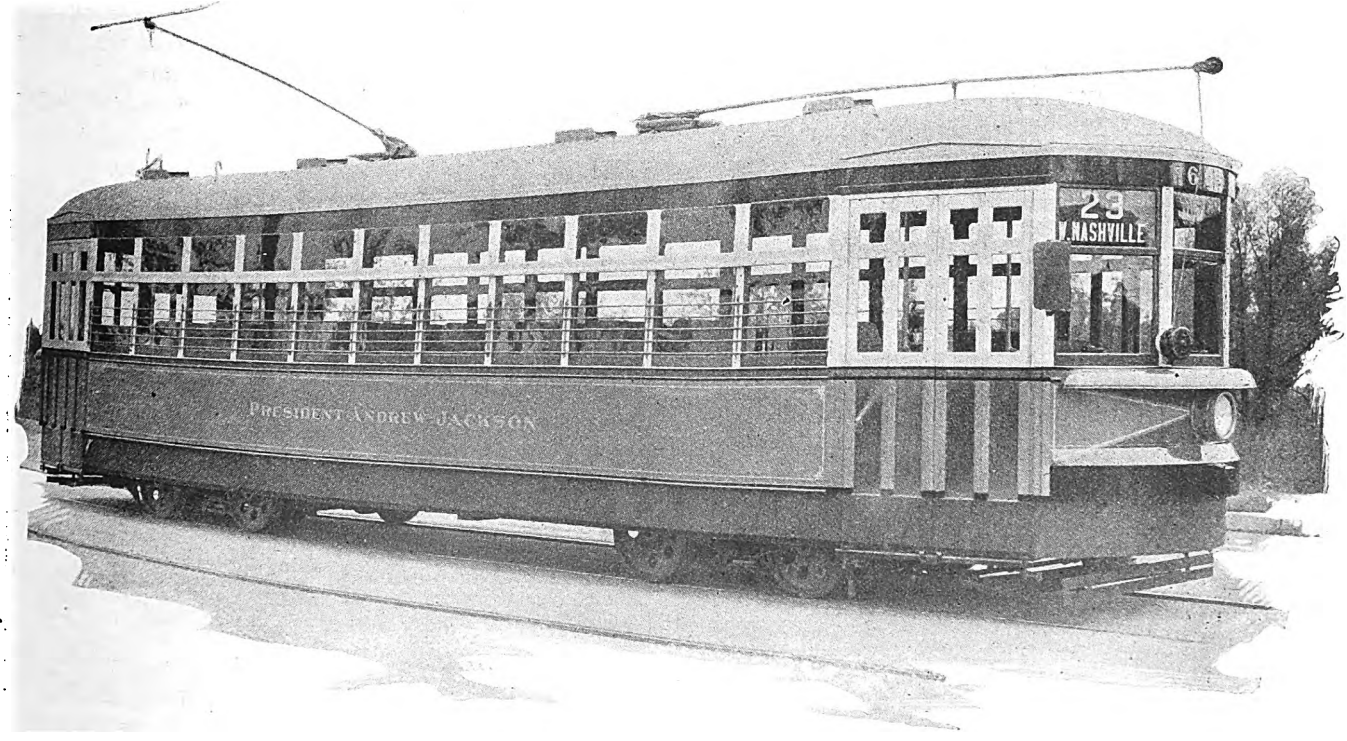
Elimination of trap doors in the floor assists in noise reduction. It necessitates all inspection and lubrication being done from beneath the car, and thus workmen with soiled clothing or hands do not enter the car and accidentally get oil or dirt on the seats. Roller bearings are used for armatures and wheels. An air-operated automotive type band brake eliminates the noise of rattling brake levers and shoes.



Interior of one of the Nashville cars. Symmetry, interior finish and excellence of illumination create an appeal to the rider

All electric switches are mounted on an accessible instrument board on the dash, together with the pneumatic door control, air brake and hand brake levers. The low dash affords the operator a clear view ahead and an outside mirror shows him the condition at the rear door. A windshield cleaner keeps the front window clear in rain or snow.

Semi-indirect lighting fixtures of box design provide evenly distributed illumination. Thermostatically controlled heaters are installed under the seats. No rods or cords are used for the operation of fare registers or signal bells. A pedal controls the two air-operated



One of the ten light-weight cars of the Nashville Railway & Light Company. Low streamline body, arch roof and broad skirt give a pleasing appearance

Digitized by Google

registers, which indicate respectively cash and transfer passengers. Push buttons control the signal bells, while the warning gong is air operated. A red rear lamp is lighted automatically when the headlight is in use.

Route and destination signs mounted in the upper right-hand platform window show a large route number and the name of the destination point. The cowl at the top of the dash conceals the lamps which illuminate it, calling attention to the car at night.

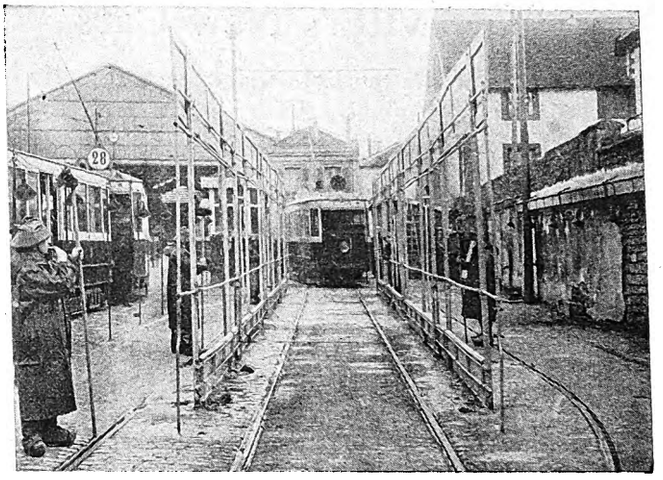
Each car has on its side the name of a Tennessee or Nashville pioneer. The men so honored are President Andrew Jackson, President James K. Polk, President Andrew Johnson, James Robertson, Sam Davis, John Servier, David Crockett, Samuel Houston, John Ball and William Carroll.

Paris Operators Wash Car in 2½ Minutes

Washing frames adapted for different types of cars and hollow brushes used for front and rear ends

CAR washing has been reduced to a science by the Paris Surface Lines, with resulting gain not only in time required for washing but also in labor. The latter is estimated at a saving of four men per day for each 100 cars, and as the company operates 3,000 cars, the introduction of these washing machines has saved about 1,200,000 francs ($48,000) per year. Since the first washing machine was installed practically every car depot has been equipped with them, and at one depot the machine is long enough to care for a motor car and trailer at the same time.

Briefly, the washing equipment consists of a framework of vertical water pipes with a number of horizontal perforated pipes set at different heights so that the spray from them will flush all the parts of the sides of a car where dust or mud might lodge. As the company has several different types of cars, there are various rows of horizontal pipes fed by different cocks. The cocks are numbered 1, 2 and 3, according to the type of car to be washed. The upper part of the framework on each side is surmounted by a board guard so that spray will not be thrown from one set of pipes over the roof upon workers on the other side of the car.

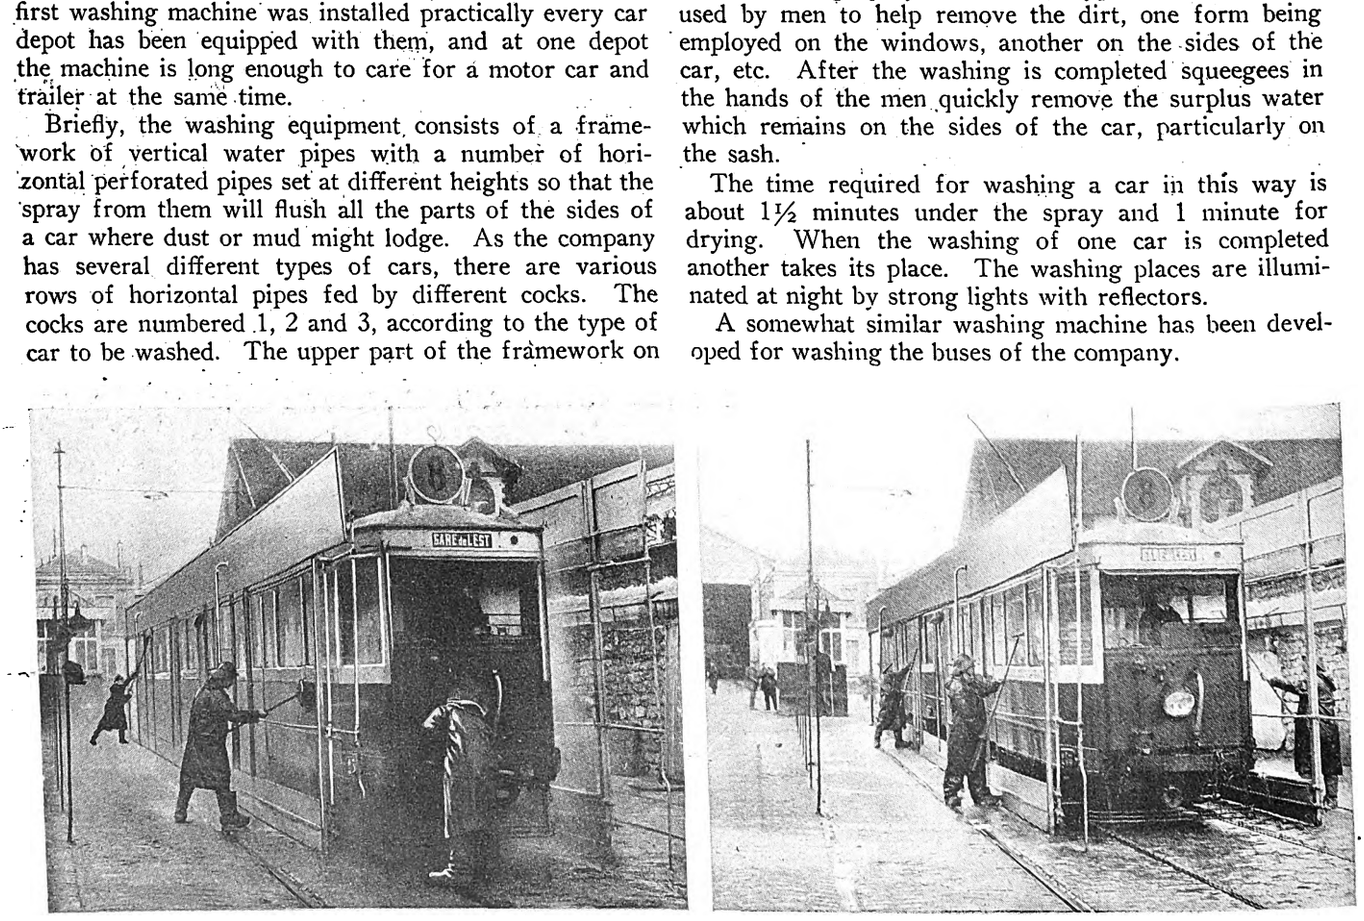


These Paris washing machines are located outside the carhouse or near the door when inside. As freezing weather is rarely reached in Paris during the winter, outside washing is practicable

To care for the front and rear end, which cannot be reached by the spray, special provision had to be made. This is in the form of scrubbing brushes with long hollow handles, the lower ends of which are connected by hose to the water system. By means of these brushes the ends of the cars can be washed quickly. While the water is being sprayed, different types of brushes are used by men to help remove the dirt, one form being employed on the windows, another on the sides of the car, etc. After the washing is completed squeegees in the hands of the men quickly remove the surplus water which remains on the sides of the car, particularly on the sash.

The time required for washing a car in this way is about 1½ minutes under the spray and 1 minute for drying. When the washing of one car is completed another takes its place. The washing places are illuminated at night by strong lights with reflectors.

A somewhat similar washing machine has been developed for washing the buses of the company.



When the water is turned on the men supplement the action of the water by brushes, which are of different shapes for the windows and panels. The ends are washed by brushes with long hollow handles. After the water is turned off the surplus water is removed by squeegees

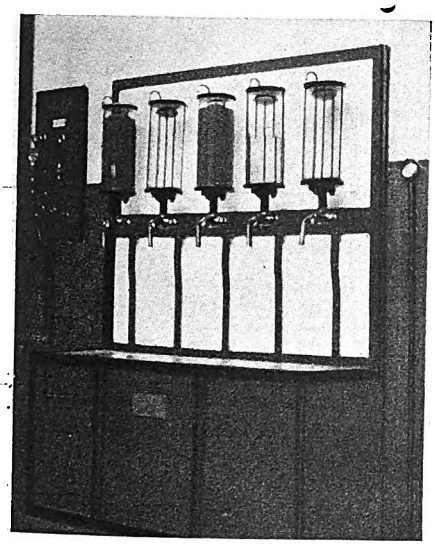
Maintenance Methods and Devices

Visible Measure for Oil Case

VARIOUS kinds of oil in continuous use in most repair shops are kept in a combination casing from which oil can be drawn as needed.



Oil tank for five different kinds of oil, fitted with means for measuring the oil removed

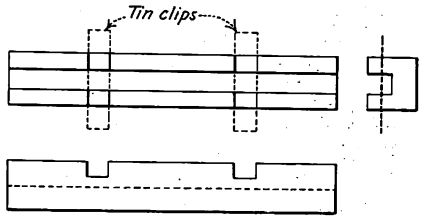
The Dortmund Street Railway, Dortmund, Germany, has a case of this kind, but with the added convenience of glass measure reservoirs, somewhat similar to those used by some gasoline filling stations in this country.

In the combination oil reservoir in Dortmund, illustrated herewith, any one of five different kinds of oil is pumped into its own graduated glass receptacle, so that the exact amount drawn off can be measured and recorded. Each of these measuring reservoirs holds 5 liters.

Device for Straightening Armature Coils

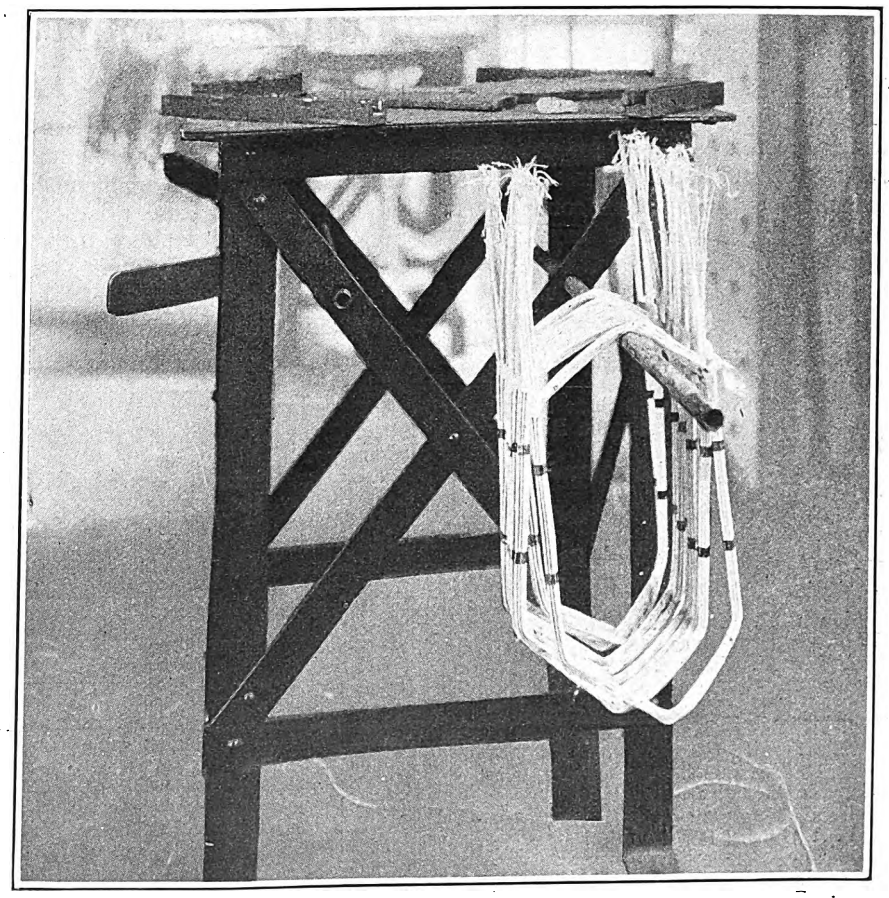
IN THE course of winding armature coils local kinks result which are not easily removed. If coils with the kinks are placed in a hot press the insulating armor which surrounds the wires becomes softened under the influence of the hot pressing and tends to push the local kinks into the soft insulation without straightening them. The result is that there is an appreciable increase in the dimensions of the coil or else the thickness of the insulation at the kink is reduced.

In order to overcome these conditions it is the practice of the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., to straighten the coil leads in clamps of a straightening table before the coils are hot pressed. The accompanying illustration shows the straightening table used. This is provided with four iron troughs, one at each corner of the machine. A detail of one of the iron troughs is shown in the accompanying line sketch. The troughs used on the straightening tables differ in size so as to accommodate different types of armature coils. The trough is machined to the thickness of the coil less the armor and is fastened securely to the table. Tin clips are laid into the cross grooves as indicated in the dotted line of the sketch. The coil is then inserted in the trough, one lead at a time, and is hammered home with a mallet and fiber. The ends of the tin clips are then turned over and mashed down with the mallet. These clips remain in position throughout the handling incident to the clipping and baking of the coils. They are removed only before the insulating armor is applied.



Details of iron trough used for Straightening armature coils

The straightening table has a metal top mounted on a steel frame-work so as to bring the top of the table about 3 ft. 6 in. above the floor. A steady rest is provided on the frame-work to support the lower edge of the coil while in the iron trough, so that the weight of the coil will not twist it out of shape. By locating the troughs at the corners of the table two men can work at the same table without interference.



Coil-straightening table as used in the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation

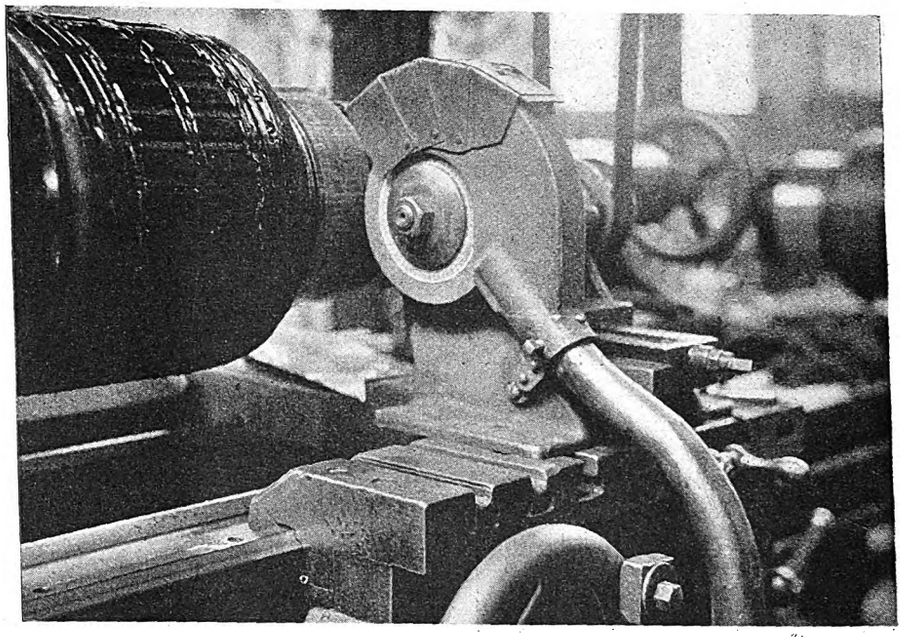
Commutators Refinished by Grinding

COMMUTATORS of railway motor armatures needing a small amount of refinishing to remove grooves and irregularities in the surface are made smooth by a grinding wheel mounted on a lathe in the shops of the Portland Electric Power Company, Portland, Ore. The company has found this method of removing slight irregularities in the commutator surface more economical and satisfactory than to take a cut with a tool. The grinding wheel is mounted on a bracket which is carried in the main tool carriage of the lathe. The cross-feed is coupled to the bracket so that the depth of grinding may be regulated. A metal guard collects the metal dust, abrasive material thrown off by the wheel and conveys it to a small pan suspended at the end of a connecting hose. The centrifugal action of the wheel is sufficient to blow this material down the tubing. The wheel used is a 10-in. x 1-in. Crystolon No. 3 grade with a rating of 60 grains. The drive to the wheel is from an overhead drum through belt to a small pulley. The wheel speed used for the grinding operation on commutators is approximately 3,400 r.p.m.



Grinding wheel mounted on lathe carriage used in the shops of the Portland Electric Power Company for finishing commutators. The 10-in. carborundum wheel is driven at approximately 3,400 r.p.m.

46 Contestants Submitted 106 Articles

in Maintenance Competition

THE closing date for articles submitted in ELECTRIC RAILWAY JOURNAL'S maintenance competition, which are to be judged for the three capital prizes, of $200, $100 and $50, has passed. There were 106 articles submitted by 46 different contestants. Articles are still being received for the monthly competition, as the monthly prizes of $25 will continue to be awarded each month up to May, 1928. Those who failed to get their material in for consideration by the judges awarding the three capital prizes still have a chance to win one of the monthly prizes by sending in the description of the device or method used.

It is planned to announce the winners of the three capital prizes in the Convention Number of ELECTRIC RAILWAY JOURNAL, which will be dated Sept. 17, 1927. The following is a list of contestants whose articles are being turned over to the judges for consideration in awarding the three capital prizes:

H. A. Albin, Lancaster, Ephrata & Lebanon Street Railway.
H. E. Bean, New York State Railways.
J. B. Blaiklock, Washington Railway & Electric Company.
Louis T. Botto, San Antonio Public Service Company.
L. A. Brammer, Jamaica Public Service Company.
H. L. Bullock, New York Central R.R.
R. T. Chiles, Cumberland County Power & Light Company.
Edwin R. Clarkson, United Electric Railways, Providence, R. I.
Arthur E. Clegg, San Diego Electric Railway.
C. H. Copley, Springfield Traction Co.
J. A. Duffy, Monongahela West Penn Public Service Company.
G. R. Fanning, Toronto Transportation Commission.
N. E. Ferguson, West Penn Railways.
P. A. Gilbert, Philadelphia Rapid Transit Company.
R. Harris, New Brunswick Power Co.
Charlie Herms, San Diego Electric Rwy.
William R. Hornberger, Philadelphia Rapid Transit Company.
Edwin C. Kelley, Virginia Public Service Company.
A. C. Lasher, Macon Railway & Light Co.
C. B. Lindsey, Los Angeles Railway.
I. O. Mall, New Orleans Public Service, Inc.
L. C. Mayer, York Railways.
W. H. McAloney, Georgia Power Co.
J. McDonald, Chattanooga Traction Co.
John McDowell, Toronto Transportation Commission.
Joseph Mercier, Montreal Tramways.
F. H. Midgley, Grand River Railway.
E. M. Miley, Chicago Surface Lines.
A. D. Moore, Philadelphia Rapid Transit Company.
Robert M. O'Brien, New Orleans Public Service, Inc.
A. T. Olsen, Omaha & Council Bluffs Street Railway.
Glen S. Reeves, Omaha & Council Bluffs Street Railway.
A. F. Rexfroth, Harrisburg Railways.
M. D. Schwegler, Toronto Transportation Commission.
Angus G. Scott, Cleveland Railway.
Thomas Standard, Omaha & Council Bluffs Street Railway.
L. Tait, London Street Railway.
A. Taurman, Birmingham Electric Company.
Farrell Tipton, San Diego Electric Railway.
William T. Trautman, United Railways & Electric Company, Baltimore.
Frank Volenec, Omaha & Council Bluffs Street Railway.
M. S. Walker, Beaver Valley Traction Company.
M. M. Watkins, New Orleans Public Service, Inc.
H. S. Williams, Department of Street Railways, Detroit.
C. W. Wood, Virginia Public Service Company.
F. C. Wornack, Virginia Electric & Power Company.

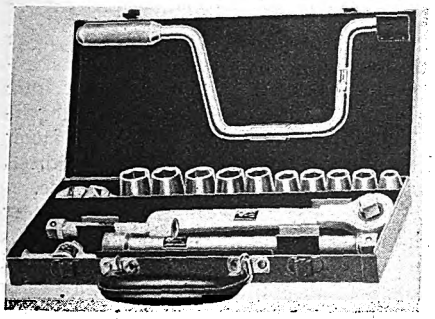
New Equipment Available

Socket-Wrench Set in Carrying Case

STILL another new chrome-vanadium socket-wrench set, put up in a substantial black enameled carrying case with a leather handle, is announced by the Bonney Forge & Tool Works, Allentown, Pa. This set includes ten chrome-vanadium hexagon sockets, from $\frac{7}{16}$ to $\frac{7}{8}$ in., inclusive, and the following chrome-vanadium handles: Ratchet, sliding "T," 13-in. brace, speeder type, 5-in. extension, 10-in. extension, and universal joint.

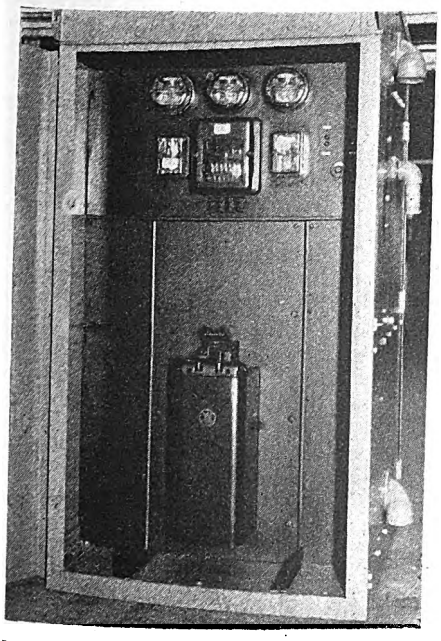


A conveniently arranged carrying case is provided for these socket wrenches

Economical Outdoor Switchhouse

SEVERAL desirable changes in the design of outdoor switchhouses have been made by the Westinghouse Electric & Manufacturing Company. One of the most prominent is the reduction in height which makes a single unit more compact and also allows ready mounting under existing structures and buses. Another feature is the complete isolation of the front from the rear of the houses without decreasing accessibility. This assures that a unit will have an entirely dead front, and will be neat in appearance and rigid in construction.

The meters and relays are now mounted on steel panels instead of slate. The steel provides additional bracing to the houses as well as eliminating the possibility of panel breakage. The circuit breaker control relay is mounted in a glass case, thus removing danger of contact with live parts in the front of the house. This enables power stations to utilize the services of a less inexperienced man to obtain meter readings without danger of physical injury from contact with live parts.



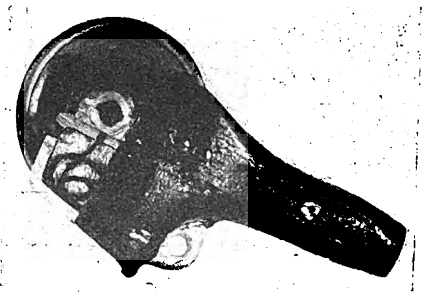
Front view of outdoor switches, showing steel switchboard and inclosed meters

Trolley Harp with Wick Lubrication

USE of an oil reservoir in each cheek with a wick to carry the oil by capillary action to the wheel bushing is the feature of a trolley harp being marketed by the Neveroil Trolley Harp Company, Ltd., Lethbridge, Alberta. Harps are made of an aluminum alloy which is said to have a tensile strength of 35,000 lb. per square inch. The weight of the harp is slightly less than that of the average now in use.

The oil reservoirs have a capacity sufficient to lubricate the bushing for 10,000 miles of car travel. The manufacturer, however, recommends refilling every 5,000 car-miles as a precaution against lack of attention at the right time. The wick, which carries the oil from the oil chambers to the wheel bushings, terminates in the form of a cushion in a recess formed in the center of the axle. Wear of the wick is very slight as the film of oil evidently protects it, with the result that the wick does not deteriorate materially during the life of the wheel.

Results from test service lasting over four years indicate that the life of trolley wheels with this method of lubrication is increased approximately 25 per cent due to true running and less arcing and no replacement of bushings is required, as the original bushing outlasts the wheel.

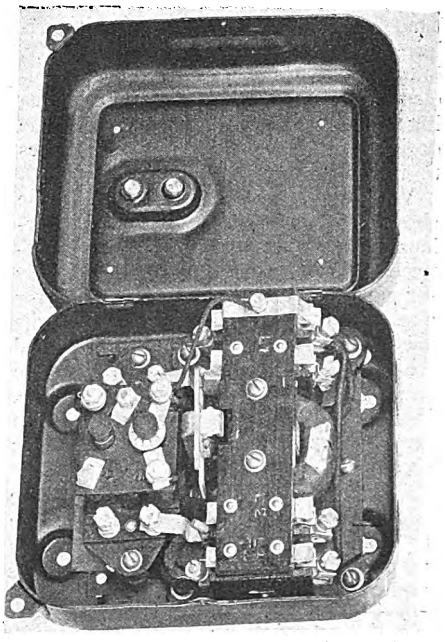


Trolley harp with portion cut away to show oil chamber and wick

Small-Sized Starter for A.C. Motors

FOR starting motors of 5 hp. and under the Cutler-Hammer Manufacturing Company, Chicago, Ill., has just brought out a small across-the-line starter. It gives push-button control for starting and stopping and provides thermal overload and no-voltage protection.

The push buttons are in the front cover of the case. The small size permits mounting in convenient locations and close to the motor so that extra wiring is saved. The contactor has a roller which is forced between two fingers to complete the circuit, making a double break wiping contact. To adapt the starter for the particular horsepower rating desired it is necessary only to insert the proper sized heater coils in the thermal overload relay.



Small across-the-line starter for 5-hp., a.c. motor

Association Activities

Application of Production Methods to Repair Work*

By T. E. Alderdice
Superintendent of Shops Pittsburgh Railways

THE Pittsburgh Railways operates 115,590 car-miles per week day on approximately 600 miles of track (591 to be exact). Of this mileage, 25 per cent is one-man car operation. We have 1,433 cars assigned to service and operate 628 on week-day base schedule and 1,192 on peak schedule and about 250 work cars. There are twenty carhouses and one repair shop for maintenance of equipment, all under the superintendent of equipment.

Equipment maintenance work is done at the one central shop, known as the Homewood shop. Here there are five major departments namely, fabrication, method, assembly, overhaul, labor and material. The fabrication department includes the machine shop, millroom, blacksmith shop, sheet metal work, fare box repair and the electro-pneumatic work. The assembly department includes truck work, motor work, the stripping of equipment from cars and the assembly of the equipment that has been taken from the cars.

In the overhaul department cars and signs are painted, upholstering work is done, car bodies are stripped and overhauled and special way department equipment is overhauled. The labor and material department includes stores, reclamation, shop accounting, statistical, clerical, car dispatching and general labor, including janitors and watchmen. The method department, although having no direct operating responsibility, improves shop methods for greater efficiency, handles the scheduling and routing of work through the shop, and the design of tools, dies, jigs and fixtures to improve shop methods.

We do not tie up car bodies in the shop while the trucks are being overhauled. We maintain a pool of between 20 and 30 repaired trucks, ready for service. When a car is shopped for a motor or truck, the damaged trucks are removed, one of the spare repaired trucks is placed under the car and the car is immediately ready for service. We try not to keep a car in the shop any longer than 30 minutes for truck changes.

Truck overhaul work is done on a line production basis. The operations are as follows: Cutting apart of trucks by acetylene torches, dismounting of wheels and motors, delivery of new parts, bolts, lock washers, etc., by material handler, assembly of truck, mounting of wheels and motors, final assembly of truck, and final inspection by engineering inspector. By having a line method of work, the employees become specialists in particular operations and each crew of men must work as fast as the other crews along the line to prevent congestion at some point. The line also has the advantage that supervision becomes easier.

For motor repair work, the motor comes from the truck stripping position and is mounted on a small movable carriage which rolls on rails. We have seven positions on the motor repair track. Each man has certain operations to do. He has all the tools and repair parts necessary for his operations. The repair parts at his station are kept at a certain fixed quantity and are replenished from store stock every two hours, if necessary. We try to keep one day's material ahead of each man at all times. In this way we have eliminated lost time due to men hunting tools and materials. The first operation on the motor line is the removal of the armature, then the fields are tested. To this point there is a single track. If the fields are O.K. the motor frame is switched to a second track which parallels the first track. This second track joins with the first again at the seventh position where the repaired armatures are applied. If motor is defective, it goes through on the regular work track. In the near future, we intend to move the armature winding department so that it will parallel the motor line. After the motor has been tested it is mounted on wheels and axle and fed into the truck line.

The stores at Homewood are under shop supervision, although the materials in stores are chargeable to material and supplies accounts until withdrawn for service. The fact that the storeroom is included in the shop organization places the responsibility for both labor and material entirely up to the shop organization, thus preventing "passing the buck" about not having material on hand when it is needed.

The storeroom is subdivided into sections based upon the operating accounts to which the material is charged when withdrawn. On the end of each case of storage bins there is placed a blueprint giving the following information: operating account number with items arranged alphabetically, class number and bin number. This plan greatly expedites the filling of requisitions.

We have one stock clerk in charge of each section. His duty is to keep properly stored all materials belonging to his section and to fill all requisitions which are sent to his section. To facilitate this, we insist that a separate requisition be made by the shops and carhouses for each account to which material is to be charged.

There is a regular schedule of two deliveries per week by motor truck from the main storehouse to the carhouses. The schedule to the shop calls for four deliveries per day by means of a tractor truck with trailers. We have two trains of these trailers. While one train is being delivered and unloaded in the shop the other train is being unloaded and loaded in the storeroom.

These trailers are marked with the different departments to which they are to be delivered. The trailer which belongs to the department nearest the storeroom is placed at the rear end of the train. When the driver reaches this point the material handler in the department unhooks and proceeds to unload the trailer. This trailer is then loaded with any repaired or excess material in the department, which is returnable to stores. In the meantime the driver has proceeded to the next department, where the same routine is followed. When the tractor driver

Digitized by Google

reaches the end of his run he is held up a few minutes while he and the material handler unloads and loads the last trailer. He then retraces his course to the stores department, picking up the loaded trailers and the requisitions which have been issued. These requisitions will be filled and ready for delivery on his second trip. Clerks, foremen or men are not permitted to go to the storeroom for material.

In addition to tractor deliveries from stores to the shop, we have inside the shop a tractor equipped with trailers which is manned by a driver and helper. This tractor is stationed in the reclamation department. When it is desired to move material to be repaired inside the shop the department which wishes this material moved telephones to the reclamation department.

In order that the heads of the various departments may be informed as to the cost of material used, all disbursements of the stores department are totaled daily by accounts and subdivided into disbursements to shops and carhouses. This figure is available at noon the day following. All credits on material returned to stores are handled similarly, so that by deducting these credits from the disbursements the net material cost per day is known.

Reclamation Division Plays Important Rôle

There is a division of the labor and material department known as the reclamation division, which functions in the capacity of a key position in the return of material to the stores department. All used material is removed from the carhouses and sent to the reclamation department by truck. Carhouse men are not permitted to scrap any material. When it is received at the reclamation division it is inspected by an engineer, who decides whether it is to be scrapped or repaired. His decision is based upon the material cost record to date. If the net material costs are running high he tightens up on the scrapping of material. In this way a control of the material costs is obtained by controlling the scrap pile at one central point.

After the material that is to be repaired is segregated from the scrap it is again segregated by items. It is then held until a sufficient number of pieces has been received, ready for repairs. This pool is decided on the basis of the quantity that is the most economical to be put through the shop. After the pool point has been reached a shop order is issued on the fabrication department for the repair work. This order accompanies the material into the fabrication department. The time of each employee and the material used are entered on the back of the shop order and from this information the cost of doing the work is calculated.

When the repaired material has been received the reclamation foreman makes out a returned materials report and sends the material to the storeroom. When this material is received into stock the materials and supplies accounts are charged with its value and the proper operating account is credited. The value of the material is based upon the cost of new material.

The method department is headed by a practical production man who has a tool maker, time estimator and job schedule man reporting to him. The tool maker, under the direction of the supervisor of methods, makes jigs, dies and fixtures for increasing the shop production. The time estimator sets standard times for all operations in the shop and checks the actual performance of the work, to see that it is within the standard time set-up. The job schedule man routes all work through the shop and sees that the routing is lived up to and the work completed within the schedule and kept moving through the shop.

The aim of our entire organization is to obtain better results at minimum cost and effort. We have only 342 men on shop work, or approximately one man for every five cars operated. We believe we have merely scratched the surface of the possibilities in the improvement of our shop organization and practice and so we are continuing to plug away for better results.

Lacquer Finishes for Street Cars*

By D. H. Boll

Supervisor of Overhaul Pittsburgh Railways

Lacquer is a solution of nitrocellulose with pigment and a few other ingredients in a highly volatile liquid which evaporates very rapidly, after application, leaving a tough, strong, protective film. Various industries have been using a protective coating known as lacquer commercially for many years. This material has been found useful on lighting fixtures, metal spinning and stamping work, hardware, silverware and other similar articles. Those lacquers, however, are of a slower drying nature and are not really comparable with the material now being commonly used and known as lacquer. However, the successful introduction of pigments into those lacquers finally led to the present product.

Five principal materials find their way into the making of lacquer. These are nitrocellulose, gums, softeners, pigment and volatile solvents. Each of these materials plays its own necessary part in making the use of lacquer practical. Nitrocellulose, also commonly called nitro-cotton and pyroxylin, furnishes the body of the film and makes up the greater part of the material deposited on a surface. The gums used are to increase the adhesion of the lacquer and to add luster to the film when dried. The softeners, which remain in the film after it has dried, increase the elasticity of the dried film and prevent it from becoming too hard and brittle. Pigments with a good hiding power must be used because so much less pigment material can be carried in lacquer than in paints and varnishes. The pigments really act as a sun shade to the film. Clear lacquer will decompose at about the same rate as clear varnish when exposed to the sunlight, but when pigments are added the decomposition is very slow, much slower, in fact, than with a pigmented paint or varnish. Then, finally, there are the volatile solvents. Several of these can be used. They all evaporate very quickly, leaving a hard, dry film. This is the most important difference between lacquer and paints or varnishes. A lacquer film is dry to the touch in less than fifteen minutes, depending, of course, on the humidity of the air in the shop.

The protective film left on the surface by lacquer, after it has dried, is very tough and hard, but retains a certain amount of elasticity. The gums decompose very slowly. The film is practically chemically inert and no chemical changes take place within the film during its life. Dry cleaning improves the luster of lacquer. It can be cleaned easily because the surface is more impervious to dirt than is paint or varnish.

In Pittsburgh we find a difference in time and an improvement of appearance resulting from lacquer on cars. The dirt we experience there is of a very sticky type, characteristic of a large industrial city. It cleans from a lacquer film much more readily than from any other protective paint material. Furthermore, acid can be used for cleaning lacquer without any harmful effects, and our experience has proved to us that other surfaces cannot be cleaned often by acid without ill effects, particularly, enamel surfaces.

Ease of Application an Advantage

Lacquer can be easily sprayed. It is very essential that the surface to be covered be clean and absolutely free from grease, dirt, water, scale or any other foreign substances. We believe the best method of cleaning steel for the application of lacquer is by means of a sand blast.

We are at present applying lacquer finishes to our steel cars as they go through the shop. The first car we lacquered was finished Aug. 3, 1924, almost three years ago. This car is still in service with the original job and is in very good condition. Following that, a number of lacquer manufacturers were given one or more cars on which to apply their complete system, and the results have been very carefully watched. Beginning in August, 1926, just a year ago, we began to finish all

*Abstract of paper presented at semi-annual meeting, Electric Railway Association of Equipment Men, Southern Properties, Atlanta, Ga., July 27-29.

Digitized by Google

steel cars going through the shop in lacquer, on a production basis.

We do not use lacquer over wooden surfaces. The greater part of our equipment is steel. We have experimented considerably with lacquer for wood, but have not as yet convinced ourselves that we should standardize on its use for wooden surfaces. Our experience leads us to attribute the difficulty to the nonporous nature of the lacquer film and the presence of moisture in the wood. There seems to be no reason why a practical lacquer will not some day be developed to overcome this difficulty, if such a lacquer has not already been developed.

Have Used Lacquer Over Old Varnish

On some cars we have applied a lacquer finish over the old varnished surface. This system gave fairly good results, but it cannot be expected to give the results that are obtained when the old paint is removed. The schedule we followed for this work was as follows: first day, wash and scrub the car thoroughly inside and out; second day, clean and prime scratches, rust spots and dents. At this point we cover the windows and doors with shields and mask the headlight sign and stop-light glasses. Third, putty all uneven surfaces, not trying to putty out any scratches or dents that are very deep; fourth day, scuff sand and apply one coat of a special surface or intermediate coat; fifth day, scuff sand and apply three coats of lacquer; stripe and edge bumpers, roofs, steps and other parts that are trimmed. Spray equipment is used for all work in our shops wherever possible. We prefer the forced feed type of this equipment to the suction feed. We make our own masking materials from whiting and soap. These are used half and half, with enough water to make a consistency that permits application with a brush to the surface to be cleaned.

With the advent of lacquer we do all the painting work in six days, including roof, floor, ceilings, interior wood and steel finish and stanchions. The schedule is arranged as follows: First day, clean off old material with the Moore chemical process or varnish remover. Apply shields over sash and doors if they are not removed and in the openings if they have been removed. Mask the headlights and stop lights. Second day, blow out all joints where remover may be lodged with an air hose. Clean off rust spots with a wire brush emery cloth and lacquer thinner. Wipe the entire surface off thinner so as to remove any grease that may be present. Then spray a coat of 24-hour oil primer. Third day, putty all uneven surfaces early in the morning and spray a coat of surface paint in the afternoon; fourth day, spray a coat of oil surfaces; fifth day, spray three coats of lacquer; sixth day, stripe and number with lacquer and edge in buffers, couplers, roofs steps, window guards, etc.

We find the first costs of the lacquer and varnish systems are about the same, due to the difference in the costs of the materials. A large saving is made with lacquer, however, because of its durability and the ease with which it may be cut in when the surface is damaged. We have experienced very little trouble with lacquered cars changing color, and when a car is damaged so that new material is necessary on the exterior, the cutting in system is very simple and effective. Our present procedure with work of this nature is to apply a coat of quick-drying lacquer primer, usually late in the day. The next morning we use a quick-drying lacquer putty if necessary and in a couple of hours spray one or two coats of a quick-drying lacquer surfacer, and we are usually able to get the color and striping on the same day. We are obtaining very good results with this quick system, and it is being watched very closely, since it indicates the possibilities of applying an entire lacquer system in two or three days.

Elimination of spray dust is one of the problems encountered in the use of lacquers. We are installing a ventilating system to exhaust these fumes. They are considered not injurious to the health of employees but they do create a fire hazard unless the shop is large and well ventilated.

Railways Urged to Enter Safety Competition

WHEN the Anthony N. Brady safety award was revived this year, after having been dormant since 1916, the American Electric Railway executive committee felt that additional stimulus would be given to the laudable effort being carried on by electric railways to safeguard human life. It felt also that this competition would give additional opportunity for calling attention to the street car as "the safest place on the street."

Prior to Aug. 1, the original closing date for this year's contest, only two electric railways filed briefs with the American Museum of Safety. In the hope that other properties will enter the contest, the time limit for filing briefs has been extended to Sept. 1.

Conditions of the contest are such that the preparation of briefs is made as simple and easy as possible. Now that the time limit is extended, it is earnestly to be hoped that many other companies will avail themselves of this opportunity of recording their safety achievements and help to direct public attention to the safety of the street car. The importance of the subject justifies wider interest in this contest on the part of electric railway executives than is indicated by the number of entries that have been made.

Lucius S. Storrs.

International Association Will Meet In Rome Next Year

ROME has been selected as the place of the convention in 1928 of the Union Internationale de Tramways, de Chemins de fer d'Intéret Local et de Transports Publics Automobiles. An official invitation to meet in Rome was received from the Italian Government. The date of the convention has been set for May 6-12, 1928. This is considerably earlier than the association has been accustomed to meet, but the time was set presumably because the weather in Rome in May is delightful.

A list of the subjects to be covered follows:

"One-man Cars," by M. Bacqueyrisse, general manager of operation and engineering, Paris tramway and bus system.

"Recent Improvements in Brakes for Electric Railway Cars," by M. Vente, chief engineer Marseilles Tramways; M. Allard, consulting engineer, National Interurban Railway System of Belgium, Brussels, and M. Cuccoli, engineer Milan Municipal Tramways.

"Gasoline Motor Cars," by M. Mellini, Department of Public Works, Rome, and M. La Valle, general supervisor of the Department of Railways, Tramways and Automobiles, Rome.

"Recent Improvements in Track Construction," by M. Van Noorbeeck, inspector general, National Railway System of Belgium, Brussels, and M. Jeancard, general manager, Light Railway Company of Charentes, Paris.

"Relation Between Axles and Car Body; Fixed and Radial Axles," by M. Castaing, chief engineer of traction and supplies, Paris railway and bus system, and M. Harmel, manager East-West Railway of Liége, Belgium.

"The Motive System for Automobile Transportation," by M. Guiffart, manager French General Tramways Company, Paris.

"Methods and Equipment for Improving the Regularity of Tramway Service," by M. de Barquin, consulting engineer, Brussels Tramways.

"Tramway Operation on Right-of-Way or Reservations in City Environs," by M. Lenartowicz, assistant manager Warsaw Tramways.

Communication on "Standardization of Street Railway Motors," by M. Peridier, manager of technical research, Paris tramway and bus system.

Communication on "Rail Corrugation," by M. Thonet, manager and vice-president, Société Anonyme d'Entreprise Générale de Travaux, Brussels, and M. Bacqueyrisse, general manager of operation and engineering, Paris tramway and bus system.

Pick-Up-and-Delivery Service to Be Discussed

AN ACCORDANCE with the action taken at the meeting of the Central Electric Traffic Association held in Fort Wayne, Ind., on July 19, 1927, there will be a special meeting of the association at Hotel Keenan, Fort Wayne, Aug. 16, 1927, commencing at 8 a.m., Central Standard time, for the purpose of further discussing pick-up-and-delivery service and trap car service by truck. The discussion at the meeting on July 19 developed that member lines should

Digitized by Google

make a canvass of the territory which they serve in the endeavor to ascertain approximately the amount of additional tonnage and revenue they might receive by rendering truck service, the approximate additional cost of performing such service, determine the points at which such service will be rendered and draft such rules and conditions under which the service will be performed. If the above information is covered fully by each member attending this meeting it will be possible to submit a plan for performing the service.

American Association News

Unusual Program Planned for Cleveland

Luncheon conferences on Tuesday, Wednesday and Thursday to cover wide range of operating problems—Speakers of national prominence to address formal meetings

A PROGRAM combining in an unusual way two general classes of meetings is planned for the American Association sessions at this year's annual convention. There is to be ample opportunity for the exchange of practical operating experience among electric railway executives and also a program of prominent and inspiring speakers from outside the industry who have a real message of direct interest.

This is to be accomplished through a series of round-table luncheon conferences to supplement the formal program of speakers. These will be held on Tuesday, Oct. 4; Wednesday, Oct. 5, and Thursday, Oct. 6. Six simultaneous luncheons will be held on Wednesday and seven on Thursday, each devoted to a subject of special interest to railway executives. The thought in mind is that delegates will attend the meeting in which they are most interested.

Tentative plans for these conferences include the following general subjects:

Tuesday, Oct. 4

1. Traffic regulation.
2. Taxes.
3. The motor bus.
4. The trend in franchises.
5. The valuation question.
6. Advertising—to increase riding; to improve public relations.

Wednesday, Oct. 5

7. Cars—What's being done and results.
8. The problem of financing.
9. Public relations.
10. Bringing city service up-to-date.
11. Developing sales instinct in platform employees.
12. Trend of fares.
13. Employee relations.

Thursday, Oct. 6

14. Opportunities and prospects for the interurban.

To Afford Opportunity for Discussion Among Executives

In announcing this innovation it was the thought of the program committee that many railway executives come to the convention with some particular problem in mind on which they desire help. It is impossible to frame a formal program to meet all the varying problems that would thus be developed. It was thought that this luncheon conference plan would provide a medium whereby every railway man would be able to get help on the problems he had uppermost in his mind. Those who were seeking help on a given subject and those who had recently made some accomplishment along the lines of the subject under discussion would naturally choose the same luncheon, and this would provide the ideal condition for exchange of information.

It is the committee's intention that these luncheon meetings will be conducted on the most informal basis possible. No one will rise to talk. It will be a cross-table exchange of experiences and questions. The sponsor will merely serve to get the discussion started and perhaps guide it somewhat. The luncheons will start at 1 p.m. and will last until 2:30 p.m. In the afternoon the affiliated associations' sessions are not to be called to order until 3 p.m.

Luncheon Tickets to be Sold in Advance

The luncheon meetings will be well advertised in advance and delegates will be urged to make reservations early in order to avoid disappointment in attending a meeting in which they are particularly interested. Tickets will be sold in advance. To insure informality during the luncheon conferences, each will be limited to an attendance of 50. It is the committee's thought that the entire success of these conferences will depend upon early reservations being made by those who wish to take part in the discussion of a particular subject.

The tentative program for the three main morning sessions of the convention includes a list of prominent speakers of national reputation who can bring to the electric railway industry a broad viewpoint and an inspiring message. In arranging this main program the committee has taken special pains that no talk longer than 30 minutes and that two-hour sessions instead of three-hour sessions will be the rule. Routine business, however, will be held to a minimum. The committee is arranging for copies of the program to be sent in liberal number to every member company, and to individual members as far in advance as it is available. It also plans to have loud speakers in the main meeting room and to make every possible provision for insuring that noise and distraction in the meeting room will be reduced to a minimum.

Special Bulletins

FOLLOWING is a list of special reports being prepared by the Bureau of Information and Service of the American Electric Railway Association. They will be available for member companies upon request:

Bulletin No. 153.—Motor Bus Operating Reports.—This contains copies of the annual reports of a number of independent motor bus companies and summaries of the reports of large groups of companies to the state public service commissions, together with miscellaneous data on motor bus operations compiled from various sources.

Bulletin No. 154.—Electric Railway Timekeeping Systems.—Describes in some detail the methods adopted by a number of electric railways for keeping the time of their employees, and their methods of preparing their payrolls. Copies of the various forms used are also given with some description of their use.

Bulletin No. 155.—List of Common Carrier Motor Vehicle Operators, Eight States.—Contains a complete list of individuals and corporations receiving certificates of convenience and necessity from the public service commissions in eight states, showing the name of the company or individual, the address, and, where this information is required by the commission, the number of miles of route and the number of vehicles operated.

Bulletin No. 156.—Comparison of Electric Railway Operating Conditions, Operating Expenses and Results of Operation on Various Unit Bases, Part III, Combination City and Interurban Lines.—A tabulation of ratios and unit figures derived from the operating reports of combination city and interurban companies, for the calendar year 1926. Included in the data tabulated are average speed, number of passengers per mile of track, per car mile and per car operated, operating ratio, gross and net revenue per mile of track, cost of maintaining plant and equipment per car mile and per unit of property maintained, and operating costs on various unit bases of comparison.

In addition to the above the following supplements have been prepared, bringing the information they cover down to date:

Supplement No. 23 to City and Interurban Fare Bulletins Nos. 41 and 42.

Supplement No. 5 to Bulletin No. 129: Wages of Trainmen.

Supplement No. 5 to Bulletin No. 130: Wages of Bus men.

Cost of Living Studies (Bulletin No. 157.)

News of the Industry

Reasons for Seeking Increase in Baltimore Explained

In an effort to increase public understanding of the application filed with the Maryland Public Service Commission by the United Railway & Electric Company, Baltimore, asking an increase in fare from 7½ to 10 cents and immediate relief measures, the company has published advertisements in the newspapers setting forth the situation frankly and has sent a number of these statements through the mails. The company also issued a pamphlet answering twenty questions most likely to be asked by the public in connection with the application for an increased rate. As a further means of keeping the public advised the company has announced that C. D. Emmons, the president, will be glad to answer any questions.

The United's effort to get an immediate hearing for an emergency rate was met by a statement from the Public Service Commission that it would have to dispose of two other cases with emergency features before the railway case could be considered. The hearing is expected to take place, however, within the next few weeks.

Following action by Mayor William F. Broening, Charles C. Wallace, City Solicitor, will join with Thomas J. Tingley people's counsel, opposing the fare increase.

A statement made by Mr. Emmons said that with a 10-cent fare the company would make numerous improvements, increase the wages of the carmen from 53 to 55 cents an hour, increase the miles of track rebuilt yearly from 16½ to 20, purchase 75 new articulated cars at a cost of $27,000 each and add other new cars as required and increase the amount set aside for depreciation. He also said that increased revenue would increase the amount of park tax paid.

Long Beach Franchise Requests Refused

Requests of the Lang Transportation Company and the Pacific Electric Railway for franchises to operate carrier systems in Long Beach, Cal., were refused by the City Council recently. The action came when H. S. Callahan, City Manager, advised the body that in his opinion the "universal transfer" clause in the city charter prevented any one but the Pacific Electric from receiving a franchise.

This clause has been the chief stumbling block in solving the city's transportation problem. Its legality is being tested. Should the clause be found constitutional, the city may be forced to establish municipal lines.

The citizens' transportation committee advocated municipal ownership as a means of solving the problem and urged the Council to purchase 45 buses. These would be used for lines paralleling or replacing those now operated by the B. & H. Transportation Company. This company is operating lines under revocable permits. It has made the city an offer to sell out for $480,000, but city officials declined the proposition.

The decision that the franchise offers of the Lang Company and the Pacific Electric Railway were not satisfactory, the refusal of all offers of the B. & H. Company and the questioned legal status of the universal transfer clause have all tended to complicate a situation which city officials insist must be settled at an early date.

Paint Job Pleases Oklahoma City Patrons

The joint receivers of the Oklahoma Railway, Oklahoma City, Okla., are receiving many favorable letters and comments upon the new paint on city and interurban cars. The old standard orange color is being replaced by bright and attractive color combinations. The interiors of the cars are also being repainted and redecorated, giving a general appearance of beauty and cleanliness. Those who have commented on the situation say that the new color schemes constitute an improvement in the general scenery of Oklahoma City, and that the redecorated cars will make a favorable impression not only upon home folks but upon visitors as well.

Zone Limits Readjusted

New Jersey board hands down order modifying limits on trolley and bus lines—Discussion involved issue of its right to co-ordinate bus and railway fares

A GENERAL adjustment of bus and electric railway fare zones affecting Newark, N. J., and surrounding municipalities and effective on Aug. 14, is made in a decision filed on Aug. 5 by the Public Utilities Commission on the application of the Public Service Transportation Company and the Public Service Railway. The decision, in effect may cut about in half the increased gross revenue of around $650,000 annually which, it was estimated, would have resulted had the application of the Public Service been granted in full. The outstanding change provided affects Irvington. The details of the changes are of much local interest, but the recital of them in toto here would not be helpful except to persons familiar with the topography of the territory affected.

The board, in an opinion appended to the decision and order, goes into a brief history of the transportation situation, particularly rates, and discusses the involved issue raised at the bus hearings as to whether it can, under the law, co-ordinate bus and trolley fares. The opinion reads:

> It is apparent that the consequent increase in fares is an element that must be considered. If the transportation company is earning sufficient revenue to provide an adequate rate of return, the revenue beyond a fair return will not be lawful, even though its object would be to equalize the railway and bus operation.

The commission adds that the Legislature, in passing the law providing that electric railways may operate buses, clearly intended that each operation, at least as to rates of fare, should be considered separately and distinctly "and the profits of one should not be used to make up the deficits of the other." The commission says:

> While this is not the situation before use, the board nevertheless interprets this statute to indicate the policy of the state to the extent that the operations and earnings of the two forms of transportation should stand on their own basis and not be affected by the conditions of the other.

The board can, therefore, only determine the matter of the equalization of the operations of the Public Service Railway and Public Service Transportation Company if it appears that neither company is at the present time earning a return that is adequate or a rate of return that would be excessive, with such increased revenue as may accrue from the modification or adjustment of the zones.

The board then considers the financial situation of each company, setting forth that the commission, in 1921 found a valuation of $82,000,000 for the railway and that the master appointed by the Federal Court found a value upward of $100,000,000. The proofs in the present case indicate, the commission declares, that the railway is not earning an adequate return on the value of its property. Moreover, it sets forth that, even were all of the anticipated increased revenue from the adjustment of fare zones to go to the railway, it still would not be getting more than an adequate return upon the value of its investment.

In the case of the Public Service Transportation Company, the commission accepts in its decision neither the valuation claimed by the company of upward of $18,229,197, nor the valuation of John Bauer, expert for the municipalities, of approximately $11,600,000. It is inclined to the belief that the valuation is between those figures.

Digitized by Google

It points out, moreover, that, beginning the first of this year, the transportation company's operating expenses will be increased about $435,000 annually by reason of allocating to it part of the administration expenses of the operating of the transportation system as a whole, heretofore carried entirely by the railway. The commission infers that that allocation is a reasonable one in view of the fact that the general administrative officers work for the bus as well as the railway.

Its conclusion, in general, is that the bus company, even were it to get all the increased revenue anticipated under the adjustment of fare zones, would not be earning too much on the value of its investment, although it points out that the case is not a valuation rate case, as such. The opinion states:

The board is not required, in passing upon increased rates, to determine the value of the property of a company and its consequent rate of return.

It appearing that the anticipated increased revenue to the companies will not produce a rate of return that will be excessive, it becomes neccessary, therefore, to determine from the standpoint of public convenience and necessity whether the adjustment of zones as proposed by the company is suitable and proper or whether some other modification thereof would be more in the public interest.

It then goes into a discussion of the various problems involved in the proposed adjustments and sets forth what it considers should be done in each instance.

State Adds 2 Cents Per Gallon to Illinois Gas Bills

Illinois' new gasoline tax, which adds 2 cents to the price of every gallon used for motor car operation within the state, went into effect on Aug. 1. Although stoutly opposed by the Chicago Motor Club and other influential organizations, the bill which proposed the tax was finally passed by the Legislature on June 29. Claiming that the law is discriminatory and unconstitutional, the Chicago Motor Club straightway set about to restrain the collection of the tax by asking an injunction against the state to stop the expenditure of $50,000 set aside for the law's enforcement. The courts gave Attorney-General Carlestrom until Aug. 6 to file an answer to these charges.

The new law required that all dealers report their supply of gas on hand on Aug. 1 to state officers and on the twentieth day of each succeeding month pay a 2 cent tax per gallon on what has been sold or used. The incidence of the tax is, of course, shifted to the motorist, although he pays no direct tax. It is thought that the oil companies themselves will absorb bookkeeping costs and other charges.

Half of the $50,000,000 a year which is expected to be obtained by the tax will be employed in extending the state's hard road system in the counties in which the tax is collected and the other half will go to the State Treasury.

City Must Explain Abandonment of Staten Island Operation

Federal Judge Campbell in Brooklyn has signed an order directing Mayor Walker and Albert Goldman, Commissioner of Plant and Structures of the City of New York, to show cause why the city should not be compelled to resume operation of the Staten Island-Midland Railway. The order was obtained by the Westinghouse company and Mortimer Brenner, receiver for the railway. The company went into the hands of receivers in 1920 and later the city took over the operation of the lines, which serve Staten Island. Following refusal of the city to pay a $175,000 bill of the Staten Island Edison Company for power, current was shut off. The city then arranged for a substitute service by buses.

Management Discusses Affairs of St. Petersburg Municipal Railway

St. Petersburg's municipal railway is again the subject of discussion among those responsible for its conduct. Statements about the Florida property have recently been made by Mayor C. J. Maurer, the three city commissioners and R. E. Ludwig, director of public utilities in immediate charge of the operation of the railway. Mayor Maurer and Commissioners Arnold, Purvis and Veillard all favor a universal transfer. Mr. Veillard, however, tempered his statement by expressing the belief that the system could not be put into effect until the railway was in better financial condition. Mr. Arnold believes that coordination should be increased between the street cars and the bus line by using the bus line largely as feeders and issuing transfers from the bus to the street car. As he sees it, this would eliminate the long bus route and make it possible to use the buses to connect the terminal points of the railway. Mr. Purvis favors a universal transfer, but is opposed to the reduction in fare. Mr. Veillard thought the transfer system would decrease the general revenue of the railway. The Mayor said he would favor a return to the 5-cent fare rather than establish a transfer system.

Commissioner Ludwig is opposed to the proposed transfer system. He pointed out that the past year had seen a loss in the operation of the railway, even with the increase to the 7-cent fare. At the time the city increased the fare to 7 cents, it reduced the rate to points beyond Disston Avenue. In the past the fare was 10 cents to any point beyond Disston Avenue. Today it is 7 cents. Even at that, traffic has shown no increase as a result of this reduction. The director contended that the railway would show a better financial statement had it not been called upon to reconstruct the tracks to improve the boulevard, making the automobile a still more serious competitor of the railway. Mr. Ludwig suggested that newspaper space be used during the winter to acquaint the public with the many interesting places in and near the city and that the cars and buses operating to the resorts be properly placarded.

Quoth the merchant when he heard
That three of every four
Of his shoppers came by troiley,
"Park your autos nevermore.
For your parking slows up business
That is headed toward my store;
Keep your cars at home for pleasure;
Use the street cars evermore."

—*The Pretzel.*

Memorial for Early Indiana Financier

Crawfordsville, Ind., is planning to erect a memorial to Noah J. Clodfelter, one of the first financiers of electric railways in Indiana. Mr. Clodfelter's story is similar to that of so many other dreamers—he made millions for others but died in obscurity in 1901. His first work was in Grant County, where he started the electric railway from Marion to Indianapolis. Friends of Mr. Clodfelter are behind a project to erect a memorial to him. It has been suggested that a fitting epitaph would be his own statement: "I hold there is but small space between heaven and the true poet."

Pennsylvania Railroad Arranges for More Power

Under the terms of the contract announced on July 25, the Pennsylvania Railroad will buy all of its energy for use in the Philadelphia territory from the Philadelphia Electric Company for a minimum period of twenty years. At present the railroad's main line between Philadelphia and the West is electrified as far as Paoli, as is its Chestnut Hill branch.

The railroad also is the principal owner of the West Jersey & Seashore Railroad, which operates an electric system between Camden and Atlantic City. The Philadelphia Electric Company is at present supplying all the electric requirements of the Pennsylvania Railroad, both in and around Philadelphia and in New Jersey.

Work of electrifying the Pennsylvania Railroad's southward line as far as Wilmington is well under way, and announcement of the completion of the Philadelphia and West Chester division's electrification is looked for in the near future.

A large portion of the energy that will be consumed by the Pennsylvania Railroad and other large wholesale buyers of electricity from the Philadelphia Electric Company will be supplied by the hydro-electric plant at Conowingo, which is expected to be in operation late in 1928. Among the other large wholesale customers of the Philadelphia Electric Company are the Philadelphia Rapid Transit System and the Public Service Corporation of New Jersey.

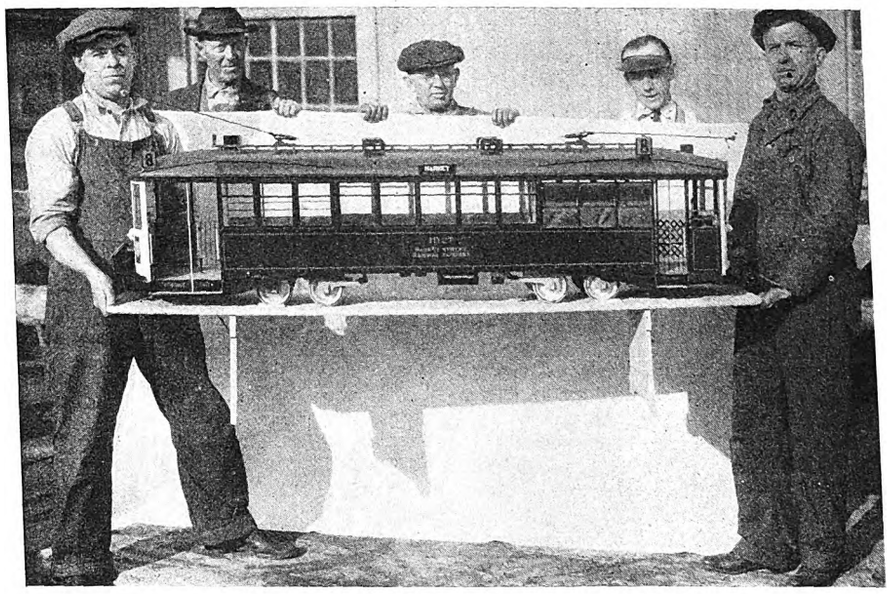
Model of Latest Type California Car

Shopmen of the Market Street Railway, San Francisco, have built a model of the latest type California car, constructed to scale and complete in every detail with the exception of lights and motors. The wheels are equipped with rubber tires so the model can be used for display purposes. The front and rear ends are painted white, but the body is painted the regulation color. One end is equipped with side curtains. The window frames are equipped with glass. Fenders are placed at the front and rear ends. Each department in the shop made the same parts for the model that it builds for its big brothers. The men who did the work are shown in the accompanying illustration. From left to right they are as follows: W. A. Crocker, body builder; Al Haug, tinsmith; John H. Wallbrink, machinist; H. M. Rist, painter, and T. Thomas, foreman car builder.



Another California wonder appears

Cars Run Express and Buses Local in Detroit

A combination of express cars and local buses will soon be tried by the Detroit Department of Street Railways at Detroit, Mich., on Jefferson Avenue. The express car service planned on Jefferson Avenue will be from St. Jean Avenue to Bates Street with five ½-mile stops. The 60-day trial will suffice, it is expected to establish the merits or demerits of the express car idea. It is hoped that the limited number of stops will enable the cars to maintain a schedule of fourteen miles an hour. Some months ago a similar express car-local bus service system was suggested on Woodward Avenue as a modification of the Miller-Shorn system, but the plan was not put into effect. A uniform rate of fare of 6 cents will be charged on buses and street cars alike with a 1-cent transfer charge.

The splitting of the Jefferson-Grand River line has also been approved by the Council, a step which General Manager Del A. Smith estimates will save the department $225,000 a year in operating expenses. The cars will be rerouted through Capital Park. The Jefferson line will turn north at Bates Street and proceed by way of Farmer Street, Gratiot Avenue and State Street and Griswold Street back to Jefferson Avenue. The Grand River cars will go south from Grand River Avenue into Shelby Street at Capital Park and return to Grand River Avenue through State Street and Cass Avenue, thus separating the former line into two sections.

Audit of Atlanta's Books to Be Made

An audit of the books of the Georgia Power Company, Atlanta, Ga., in connection with its plea for increased fares has been ordered by the Georgia Public Service Commission and will be undertaken by the Audit Company of the South. The petition for increased fares is based largely upon the alleged inability of the company to earn a fair return upon its railway property at present rates. The company is seeking, among other things, a 10-cent cash fare.

Accidents Reduced in Oklahoma City

The plan of giving monthly cash bonuses to teams making the best safety records has brought greater safety to the public riding on city and interurban cars of the Oklahoma Railway, Oklahoma City, Okla. Only 87 accidents happened on Oklahoma Railway lines during June, as against an average last year of 100 accidents monthly. One team, led by W. L. Parsons, made a perfect safety record for June and was awarded the $100 cash bonus for that month.

Hartford Tax Case Set

The case of the city of Hartford, Conn., against the Connecticut Company is scheduled for Oct. 4. The city is suing the railway company for $100,000, or 2 per cent of the gross fares collected by the railway inside the city limits in 1923 and 1924. This tax has been collected annually by Hartford over a period of 30 years. In recent years the tax has amounted to approximately $50,000 for the twelve months period. Several months ago the Connecticut Company opposed the collection of the tax on the grounds that it was illegal. In a trial before Judge Newell Jennings the contention of the railway was upheld. The city appealed the decision.

No Financial Subsidy for Tacoma Railway

In two letters to the City Council of Tacoma, Wash., regarded as having special significance in view of the approach of the date when the Tacoma Railway & Power Company must have its reply to the report of Kenneth G. Harlan, city utilities engineer, ready for final discussions of the railway situation, Richard T. Sullivan, manager of the company, told the Council recently that his company has been cut off from financial relief by its parent company, and must default in its bond interest, and that it will refuse to pave between tracks on South Yakima Avenue. Failure to earn money above operating expenses and taxes sufficient to pay interest on bonds outstanding has forced the company to notify its bondholders of the coming default.

The directors of the Puget Sound Power & Light Company, holding company of the local concern, which has heretofore loaned funds to the subsidiary, has refused to finance it further, reported Mr. Sullivan.

The June figures for operations of the Tacoma lines showed a little improvement over a similar month of 1926, but the net income was still $13,500 short of the amount the Council and the company agreed should be a net return. The report stated that net income for the first six months of 1927 was $35,503 greater than similar months of 1926, but expenses were $55,821 greater, due to increased car and added bus service, so that the company was actually $24,683 worse off than the first half of 1926.

In declining to pave on South Yakima Avenue, Mr. Sullivan pointed out that its franchise on that street did not call for paving. He suggested the requirement ought to be uniform throughout.

Rainier Property Would Continue Round Trip Rates

The Seattle & Rainier Valley Railway, Seattle, Wash., has filed a request with the Department of Public Works at Olympia for a continuation of the special round-trip fare of 25 cents between Renton and Seattle. An extension until January is sought.

Fare Evidence Before Illinois Commission

Evidence to support its petition for an increase in fare in Moline, Rock Island, East Moline and Silvis was presented by officials of the Tri-City Railway at a hearing before Commissioner Hunt of the Illinois Commerce Commission. The cities of Moline and Rock Island will present their evidence at the final hearing on the petition before the commission in Springfield on Sept. 7 in support of their claim that the increase is not justified.

The company asks permission to discontinue selling tickets at the rate of seven for 50 cents and fifteen for $1. It asks that tickets be sold three for 25 cents only. No increase in the 10-cent cash fare is asked.

Rescinds Paving Relief Act in Atlanta

By a vote of 24 to 7 the Atlanta, Ga., City Council has decided to rescind the action of the 1926 City Council, which authorized relief to the Georgia Power Company of 25 per cent of its street paving assessments. Councilmen opposing the rescind motion pointed out that the 1926 Council had refused to allow increased fares and to grant the company relief from gross receipt tax charges, but after public hearings covering a period of six months had decided to allow partial relief from paving charges, to the extent of reducing those charges 25 per cent. The majority of the members felt that reductions would be unwise, "particularly in view of the 10-cent fare petition now pending."

Advertising Increases Receipts at Little Rock

An increase of 55 per cent in net earnings of the railway department of the Arkansas Power & Light Company in Little Rock for the first quarter of 1927 over the first quarter of 1926 is shown in a report recently compiled by Paul Grier Wilson, advertising manager of the company.

Net earnings for the first quarter of 1927 were $48,818, compared with $31,540 for the first quarter of 1926. The largest saving on expense was made on maintenance of equipment, which was reduced 30 per cent. Cost of maintenance of ways and structures declined 14 per cent. The second largest item of decrease was power cost. That showed a decline of 19 per cent. The cost of conducting transportation was 6.5 per cent less than for the corresponding period of the previous year. General and miscellaneous expense, including taxes, was 4.8 per cent less.

Higher Rates Sought in Santa Barbara

The Santa Barbara & Suburban Railway, Santa Barbara, Cal., has applied to the Railroad Commission that the present 8-cent fare be increased to 10 cents, 7-cent token fare be increased to 8⅓ cents, and the $1 weekly pass to be $1.50. The applicant sets forth that it has a deficit of $14,934 for the first six months operation in 1927, and an accrued deficit of $141,205. The company hopes the requested increases will enable it to maintain its present standard of service and make legitimate operating expenses, interest on funded debt and a reasonable allowance for depreciation.

British Columbia Celebrates Thirtieth Anniversary

Twenty-four employees who had been with the British Columbia Electric Railway, Vancouver and Victoria, for 30 years or more were presented with gold watches recently by George Kidd, president of the company. The occasion was the 30th anniversary of the taking over of the electric light and power and railway property by the company from its predecessors. The total length of service of the old-timers was 815 years, or nearly 33 years each. They appear in the accompanying illustration with George Kidd, president, W. G. Murrin, vice-president, and F. R. Glover, general executive assistant.

Problem Over Houston Fare

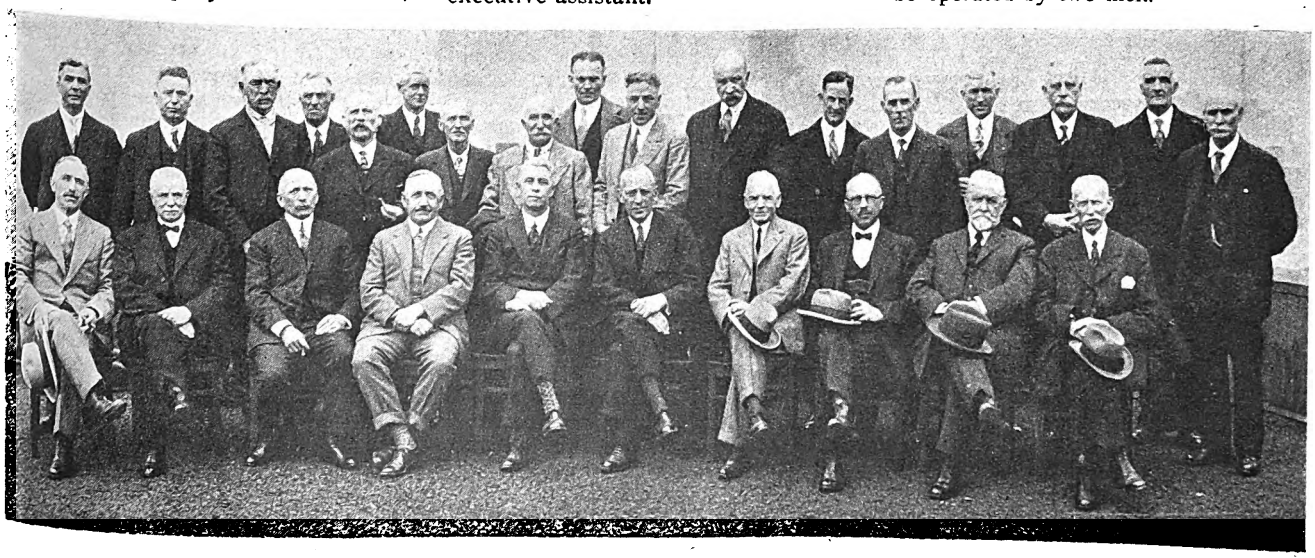
Negotiations are going on between Postmaster Nichols and the management of the Houston Electric Company, Houston, Texas, regarding satisfactory fares for post office employees under the new fare schedule in that city. Mr. Nichols said that the employees could not take advantage of the best rate. Heretofore, these employees paid fares entirely with tokens. Now the pass system offers the best rate but cash is required and the Government did not permit them to pay fares with money. Mr. Nichols said that there were about 90 employees who rode the street cars and buses anywhere from two to four times daily.

P. A. Y. E. System to Be Restored in Tacoma

Pay-as-you-leave collection of fares on outbound trips will be abandoned and the old system of paying as you enter, will be re-established on the lines of the Tacoma Railway & Power Company, Tacoma, Wash., according to a statement of Thomas F. Marsh, superintendent of transportation. The pay-as-you-leave system was established soon after the city and company got together on an agreement for experimental railway operation, the object being to save time in loading at downtown corners and thus speed service. According to Mr. Marsh, so little time is saved that running time cannot be changed, and confusion is caused by different systems for inbound and outbound cars.

One-Man, Two-Man Cars Operate

One-man, two-man cars are operating on the Broadway-East Kildonan and Morse Place line of the Winnipeg Electric Company, Winnipeg, Man. This type of car has been operated successfully on Sargent, Notre Dame and other lines in the city for some time. The arrangement means that in the busy sections, where loading is heavy, cars will be operated by two men.



Twenty-four strong reasons for rejoicing in British Columbia

Recent Bus Developments

Express Service for West Toledo

A new express motor coach service for West Toledo, Ohio, will probably be authorized to supplant the feeder service recently established in connection with the Cherry Street car line of the Community Traction Company. Legislation to this end has been introduced into the City Council.

Following the barring of interurban buses from picking up or discharging city passengers in that district the railway established a new crosstown and feeder service in the district. However, a lengthy petition to the Mayor and objections of several hundred residents of the section of the city brought forth the plan of express service advocated by Commissioner E. L. Graumlich. The Sylvania Buses, Inc., had threatened also to start a local line within the city limits.

No bus legislation has been enacted because of the apparent effort to settle the entire transit problem by a unified bus and railway service by one company.

Buses Operate in Salem

The Salem Street Railway, Salem, Ore., instituted bus service on all its routes starting on Aug. 1, thus eliminating the last vestiges of the railway line. The new service according to Thomas L. Billingsley, superintendent of the company, offers distinct improvement. Long stopovers are avoided and more people are accommodated with a speeded up schedule. Several big buses, borrowed temporarily from other points, will be replaced with special new buses within a short time. The service as installed will be subject to such adjustment as seems necessary after its trial operation. The Salem Street Railway has always specialized in service to groups, such as the State House, large canneries and other mills and state institutions, and will continue to do so with the buses.

Would Substitute Buses on Line in Jamestown

The Jamestown Street Railway, Jamestown, N. Y., filed on Aug. 5 with the Public Service Commission a declaration of abandonment of its Lakewood line, extending from Jamestown to Beechwood, and asked for approval thereof. At the same time, Jamestown Motor Bus Transportation Company, Inc., filed a petition for a certificate for a bus line from Jamestown to Lakewood.

The petition alleges that the railway line has not been operated profitably for several years and in its opinion cannot be operated at a profit; that repairs to the tracks would be necessary if the line were continued, and that in the judgment of the company it should be abandoned and service by bus substituted.

The bus company is a subsidiary of the railway and alleges that by using Fairmount Avenue and Lakewood Road for bus service, it can avoid a grade crossing and serve a new settlement beyond the Beechwood terminus of the present car line at the same rate of fare, with transfer privileges. Public hearings will be held on these applications.

Co-ordinated Service in Southern Indiana Popular

The Evansville & Ohio Valley Railway, operating from Evansville to Mount Vernon, Ind., Rockport and Grandview, Ind., and Henderson, Ky., is well pleased with the bus line installed several years ago to run from Grandview, the terminus of one of the lines to Tell City, Ind., and Cannelton, Ind. The buses connect with the cars at Grandview. Traveling men who "make" that territory have been enabled to cover their beats much more expeditiously than before.

New York Grants in Court

Franchises awarded recently to Equitable Coach Company attacked as unfair—Defense by Transportation Chairman Delaney

MAYOR WALKER of New York has expressed the belief that Stewart Browne, president of the United Real Estate Property Owners' Association, who is suing to prevent the award of the bus franchise in the Boroughs of Manhattan and Brooklyn to the Equitable Coach Company on the ground that the award was illegal, is too late in his injunction suit. The Mayor believes that his signature on the resolutions of the Board of Estimate and Apportionment, granting the franchise to the Equitable, is tantamount to the signing of the franchise itself. The resolutions were signed before the papers in the injunction suit were served.

Mr. Browne, however, was not to be dissuaded. The charge that Mayor Walker denied any opportunity for a public hearing on the tri-borough bus franchise was made on Aug. 8, before Justice Curtis A. Peters in the Supreme Court by Solomon Sufrin, attorney for Mr. Browne, in argument to support a motion to grant Mr. Browne's application for an injunction to restrain the city from delivering the contract.

Mr. Sufrin declared that this alleged failure of the Mayor to permit a public hearing, as required by law, was one of two grounds on which Mr. Browne sought the injunction. The other ground, he said, was that the terms of the franchise granted to the Equitable Company were much less advantageous than offers made by competing companies.

The point as to whether or not Mayor Walker refused to grant a public hearing seemed to depend largely, so far as the argument was concerned, upon Mr. Browne's hearing. Mr. Sufrin said that Mr. Browne contended that the Mayor called the number of the resolution in a low voice and directed the clerk to call the roll on it, without permitting opponents of the grant of a franchise to the Equitable Company to speak. Mr. Sufrin admitted that the minutes of the Board of Estimate showed that there was no objection to the franchise before the vote, but insisted that there had been no opportunity for objection.

Mr. Nicholson on behalf of the city presented an affidavit by John H. Delaney, chairman of the Board of Transportation, who denied that the Mayor had spoken in a low voice at the meeting and denied Mr. Browne's charge that the offers of the Manhattan Surface Coach Company and the Coney Island & Gravesend Bus Corporation were more favorable to the city than that of the Equitable Company.

In his affidavit Mr. Delaney discussed the comparison between the offer of the Equitable Company and its competitors submitted by Mr. Browne in his complaint in the action, to show that the conclusions drawn from it were unfair. Mr. Browne's comparison follows:

Company	Route-Miles	Borough	Compen. to City, Per Cent	Min. Guar.
Equitable.....	18.9	Manhattan	5	$80,000
Equitable.....	95.6	Brooklyn..	5	188,000
Equitable.....	114.9	Queens....	5	132,000
Manhattan Surface Coach Co..	19.3	Manhattan	*5	200,000
C. I. & G. Co....	81.6	Brooklyn..	5	100,000
Rauchwerger Bus Co.....	114.6	Queens....	5	90,000

* Plus 50 per cent of profits after 8 per cent is earned on capital invested.

Mr. Delaney said that the C. I & G. Bus Corporation, a subsidiary of the B.-M.T. and the Brooklyn City Railroad, had ignored the bus routes laid out by the Board of Transportation and had laid out their own bus routes to be supplementary to surface car operation solely to support and enhance the income on trolley lines already crowded to capacity. Mr. Delaney said that the C. I. & G. corporation also proposes to operate certain bus lines only during the Summer months, when operation would be profitable, leaving the public without service in the period of the year when it would be most necessary.

Mr. Delaney said that the offer of the Manhattan Surface Coach Company to pay the city 50 per cent of the profits after 8 per cent was earned on its capital invested really amounted to nothing tangible. The Equitable Company, he said, offered a percentage of all revenues, while the Manhattan Company offered no part of revenues which might be derived from passengers paying their

Digitized by Google

original fare on surface cars and then transferring to bus lines.

Mr. Delaney said that the comparison made in Mr. Browne's complaint that the Equitable Company guaranteed a minimum return to the city of only $80,000 a year for the Manhattan franchise, while the Manhattan Surface Coach Company guaranteed $200,000, was misleading. Mr. Delaney said that the Equitable Company guaranteed a minimum return to the city of $400,000 a year for all three boroughs and that the only purpose of using $80,000 as the figure for Manhattan was to provide a basis for computing the effect of the elimination of mileage should the Transit Commission deny certificates of convenience and necessity for certain routes or should the company be prevented otherwise from operating all the routes authorized.

Mr. Delaney said that consideration should be given to the question of whether the Manhattan Surface Coach Company, as a subsidiary of the New York Railways, and the C. I. & G. Bus Corporation, as a subsidiary of the electric railway companies in Brooklyn, would not operate buses in order not to compete with existing surface lines or produce a result which would reduce the income of the trolley companies. In conclusion Mr. Delaney said:

The additional transportation service which is offered by the Equitable Coach Company is very great, and the relief to be given is long delayed. Further delay in effecting such service through a proper execution and delivery of the contract would create very great inconveniences and visit hardships upon the people of the city.

Another Iowa Interurban Service

There will soon be two bus lines running through Cedar Falls daily on the Mason City stretch. The Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, has been granted permission by the State Commission to operate passenger buses over this territory, heretofore covered by the buses of Helen Schultz.

Special Levy on Georgia Bus Companies Vetoed

After a spirited debate, the Georgia State House of Representatives defeated a $25 per county tax upon bus lines by the overwhelming vote of 121 to 52. Thus bus lines traversing ten counties, as the lines from Atlanta to Macon, would have been compelled to pay a total tax of $250 under the provisions of the act. Numerous amendments were offered to the original measure written by the ways and means committee, but only one was accepted. This was an amendment exempting from the provisions of the act bus companies engaged solely in the business of transporting children to and from rural schools. However, defeat of the original measure defeated the amendment also. The outcome was a decided victory for bus companies.

2,100 Picnickers Handled by Bus

When executives of the Mullins Body Corporation of Salem, Ohio, asked the Youngstown & Suburban Railway for a proposition on the transportation of all of their employees by motor coach from their plant in Salem to Idora Park, Youngstown, for the annual picnic, the railway management knew it was going to be an undertaking that would require careful study and planning. The Mullins body people first said they expected about 500 to attend, but every day brought reports of an increased number, until the night before the outing they telephoned that about 1,200 were expected.

The traffic department then worked out a schedule, whereby 25 coach loads left Salem starting at 7 a.m., and the return movement was started from Idora Park at 6 p.m. The railway used every one of its own coaches and borrowed four from the Pennsylvania-Ohio Electric Company. The distance from Salem to Idora Park is 22 miles, and 2,100 passengers were handled. Negotiations are now under way for a community picnic from Salem to Idora Park, the movement to be made in the same manner.

Public Convenience in Yonkers Transcends Existing Rights

The Public Service Commission on Aug. 5 issued certificates for the operation of seven bus lines in Yonkers, N. Y., to the Merchants Community Bus Transit, Inc., and denied seven other petitions of this company and the petition of Robert Tostanoski. Orders were based on memoranda of Commissioner Van Namee, who made personal inspections and an intensive study of the transportation problem in Yonkers.

Some of the petitions to the commission were opposed by the Yonkers Railroad, which has furnished transportation in Yonkers for the past forty years. That company showed at the hearing that it carried upwards of 62,676 passengers a day. It also showed a loss in operations for the past ten years, varying between $67,000 in the lowest to $161,000 in the highest. Its balance sheet for Dec. 31, 1926, showed a deficit in "corporate surplus" of $1,826,513 while its net loss from operations in 1926 was $114,811.

The commission said that bus operation would not be authorized in direct competition with a railway which by the preponderance of evidence was giving adequate service. Certificates would have to be denied for those routes in direct competition with the Yonkers Railroad except in cases where the loss of the railroad must be overlooked because of the public convenience and necessity served by the competing bus lines. Commissioner Van Namee's memorandum went into detailed discussion of each route separately, method of operation, fare and equipment, finances of operation and the financial responsibility of petitioners.

The rate of fare authorized under the local consents of the city was 5 cents, except that on longer routes where division into zones was made, the fare was 5 cents in each zone.

Stands on Its Bus Award to Grand Rapids Interurban

The Michigan Public Utilities Commission refused on Aug. 3 to modify or rescind its order granting the Grand Rapids, Grand Haven & Muskegon Railway, Grand Rapids, Mich., a permit to operate buses between the terminal points of its lines. Thus this case is again thrown for decision into the Ingham County Circuit Court at Lansing. This decision may be final, unless the point at issue between the Michigan Public Utilities Commission and the Safety Coach Company should be appealed to the State Supreme Court, as now seems probable. The Safety Motor Coach Company had appealed to the court for a restraining order, directed against the commission, halting the interurban company from putting its buses into operation.

A hearing on the merits of the order was held at Lansing on July 18. Testimony was offered by the former members of the Public Utilities Commission, prominent residents along the railway line and the former owner of the Safety Motor Coach Company. The three mentioned litigants, the Grand Rapids Trust Company, receiver for the defunct railway, and the cities of Grand Haven and Muskegon Heights had previously petitioned the courts to appear as parties defendant and their request was granted.

The statutes provide that in an appeal from an order directed by the Public Utilities Commission, the new testimony must be submitted to the state body for review. The members are then empowered to alter their order if the testimony has any bearing on their action, or then may affirm their original order. By their decision on Aug. 3 the members of the commission stand on record on granting the bus permit to the interurban company.

Detroit's Automobile Code Considers Moderate Drivers

It's the moderate driver in Detroit, Mich., who gets there. Speeders and slow pokes are out of the running in the new traffic code which sets 20 miles an hour as the standard for making good time. The system now in vogue in that city is known as the "progressive plan," whereby those who drive at the 20-mile rate will find the "go" light showing as they approach each intersection. Whenever a driver goes faster or slower he will be confronted by the "stop" light each time he nears an intersection. *Public Safety*, published by the National Safety Council, states that Detroit drivers and tourists are unanimous in their praise of the innovation.

Financial and Corporate

Recently Organized Grand Rapids Company Issues Report

A statement of earnings of the Grand Rapids Railroad, Grand Rapids, Mich., for the two months and twelve months ended June 30, 1927, has been presented to the stockholders. These figures, shown in the accompanying table, are actual since May 1, 1927, the effective date of the organization of this company and prior thereto, give effect to the adjustment of interest and amortization of discount and expense due to the reorganization of the property.

	For Two Months Ended June 30, 1927	For Twelve Months Ended June 30, 1927
Gross earnings	$270,401	$1,745,965
Operating expenses, including taxes and maintenance	181,026	1,187,700
Gross income	89,375	558,264
Fixed charges	47,753	261,789
Net income	41,622	296,475
Provision for retirement reserve	20,249	170,888
Balance available for dividends and other corporate purposes	$21,373	$125,587

In accordance with the plan of readjustment of the Grand Rapids Railway, dated April 11, 1927, the Grand Rapids Railroad was organized under the laws of Michigan on April 15, 1927, and as of May 1, 1927, acquired all the assets and assumed all of the liabilities of the former company, including its outstanding bonds. The $600,000 of floating debt has been surrendered by the holders thereof and canceled, and in addition the $200,000 of first mortgage bonds authorized have been sold. The proceeds of the bonds and the funds received in payment for the new preferred stock have been used to retire the car trust notes and bank loans previously outstanding.

Commission Denies Brooklyn Company's Bond Sale Plea

The New York Transit Commission late on Aug. 5 denied the application of the New York Rapid Transit Corporation for permission to issue $20,000,000 of 5 per cent bonds and to sell them to the parent company, the Brooklyn-Manhattan Transit Corporation, at 80 per cent of par.

The decision of the commission was unanimous, Commissioners Gilchrist and Godley concurring in the opinion held by Commissioner Lockwood, who conducted the hearings. The contentions of Samuel Untermyer, special counsel of the commission, that the proposed financing was not in the best interests of the city were upheld and the several alternate methods of financing which he proposed were indorsed by the commission.

Mr. Untermyer contended that of the difference of $4,000,000 between the face value of the bonds and the price at which they were to be sold to the Brooklyn-Manhattan Transit about $3,000,000 would be a charge against the city, inasmuch as $12,000,000 of the money was to be used for the purchase of equipment, mostly steel cars, to be operated on the city owned subways run by the Brooklyn-Manhattan Transit Corporation. This charge of $3,000,000 would become a direct payment with 15 per cent premium added, according to Mr. Untermyer, in the event that the city should decide to recapture its subways from the Brooklyn-Manhattan Transit to form a unified system.

Mr. Untermyer suggested that the steel cars could be purchased with the proceeds of the company's prior lien bonds or by the issuance of equipment trust certificates. The company objected to the issuance of the prior lien bonds on the ground that they should be reserved for possible future financing requirements of the system. It contended that the sale at this time of first and refunding bonds to yield $16,000,000 would constitute a breach of faith toward the holders of the 6 per cent bonds of the B.-M. T. The commission suggested competitive bids be secured for the bonds.

Improved Showing in St. Louis

United Railways of St. Louis shows improvement in 1926—Interest charges reduced—Sunday and evening riding falls off

THE comparative income and expense statement incorporated in the 27th annual report of the United Railways, St. Louis, Mo., showed a deficit of $43,564 for 1926, compared with a net loss of $206,174 for 1925. Receiver Wells filed the report with the United States District Court on May 26. Gross operating revenue for 1926 was $18,873,430, a decrease of $21,143, but the gross income totaled $2,631,168. Passenger revenue alone was $18,601,698, compared with $18,628,734 in 1925, the decrease being $27,036. Interest and miscellaneous charges for the year were $2,677,568, accounting for the net loss from operations of $46,400. A credit of $2,835 for income derived from rental of bus equipment cut the net loss to $43,564. The decrease in net loss is accounted for in part by the fact that the interest charges for the year were reduced through the retirement of $4,100,000 of underlying bonds and $4,200,000 of receiver's certificates, which were taken up at the call price of $100.50 and accrued interest.

The radio was an adverse element the United Railways had to combat during 1926, according to Receiver Rolla Wells. Material gains on bus competition were made during the year, but radio entered the lists against the car system and materially reduced travel on Sundays and during the evening hours. The enormous sales of radio outfits, the report states, have greatly increased the number of stay-at-homes, with a resultant decrease in street car riding.

On the other hand, the ordinary weekday morning and evening peak hour travel is apparently about as heavy as ever, and perhaps somewhat heavier than it was. While the number of cars on the basic schedule throughout the greater part of the day was the same as a year ago, the number of cars in service at the morning peak hours at the beginning of January, 1927, was 24 greater

INCOME STATEMENT OF THE MISSOURI ELECTRIC RAILROAD

	Year Ended Dec. 31, 1926	1925
Revenue from transportation	$183,179	$154,897

Peoples Motorbus Company	23,070,442	23,814,803

Digitized by Google

than at the beginning of January, 1926, and the number at the evening peak hours 27 greater.

The average miles per hour (including terminal delays) for 1926 was 9.74, compared with 9.76 in 1925 and 9.73 in 1924.

A great deal of attention was paid during 1926 to the more scientific making of schedules to fit them to operating conditions at various times of day. The schedule department made a total of 248 new schedules, of which 164 were street car schedules and 84 bus schedules. The results of a better arrangement of the schedule show an increase in average speed.

That the bus competition can be successfully met is clearly indicated by the report for 1926. The figures show a gain of 2,321,428 in the number of revenue passengers for the street cars and the buses of the St. Louis Bus Company, auxiliary of the railway, while the People's Motorbus Company, the competing city-wide bus system, suffered a loss of 744,361 revenue passengers.

The number of revenue passengers on the United Railways city railway lines dropped 549,670, but this loss was more than offset by the increase in patronage for the St. Louis Bus Company. These figures, shown in the accompanying statement, indicate that the company gained materially on motor bus competition, Receiver Wells states, but competition from service cars and privately owned automobiles has been increasing steadily.

As a result of bus competition and the increased use of private automobiles and service cars the report declared street car fares fell off greatly in 1924, with somewhat further declines in 1925 and 1926, while at the same time the company's taxes increased and additional expenses were incurred in endeavoring to overcome the increased traffic problems produced by the added street congestion.

The report states that during the past three years the receipts of the property have been insufficient to provide adequately for the operation and maintenance of the property in the hands of the receiver and to pay a reasonable return on the value. The receiver desired to postpone as long as possible an increase in the rates of fare, but the situation became so acute that on June 4, 1926, pursuant to order of the United States District Court, the receiver filed an application with the Missouri Public Service Commission for an increase in the rates of fare. Then follows a recital of the various subsequent steps up to the plan of the receiver to give to each passenger a receipt for 1 cent for each 8-cent cash fare paid or receipt for 1 cent for each 15 cents paid for two tokens, such receipt to be redeemed at the office of the receiver in case the United States Court should on final hearing declare the tariff of Feb. 7 void.

The secured debt outstanding on Dec. 31, 1926, was $52,590,000, compared with $54,890,000 on Dec. 31, 1925, a reduction of $2,300,000. On April 1, 1926, $6,000,000, par value, United Railways of St. Louis first general mortgage 4 per cent bonds reserved to retire underlying liens were sold to the reorganization committee at par and the proceeds used as follows: $4,100,000 to retire $986,000 Compton Heights Railroad's 6's, $1,640,000 Cass Avenue Railway's 6's and $1,474,000 Lindell Railway's 8's, all of which matured on Oct. 1, 1923; $1,900,000, applied as part payment of $4,200,000 series "B" 6 per cent receiver's certificates called for payment April 1, 1926, at 100½ and accrued interest.

FUNDED DEBT OF THE UNITED RAILWAYS, ST. LOUIS

Issue	Total Outstanding Dec. 31, 1926
United Railways of St. Louis first general mortgage 4's, due 1934	$36,300,000
St. Louis & Suburban Railway consolidated mortgage 8's, due 1923	2,000,000
St. Louis & Suburban Railway general mortgage 5's, due 1923	4,500,000
St. Louis Transit Company's 5's, due 1924	9,790,000
Total	$52,590,000

The balance due on principal of receiver's certificates, together with accrued interest and premium for calling the issue before maturity, aggregating $2,447,000, was paid by the receiver from funds on hand. These changes have resulted in a saving of interest charges of $287,480 per annum.

All back interest on funded debt, amounting to $3,670,715, the payment of which had been withheld pending court orders, was paid by the receiver during the year; also all current year's interest on funded debt has been paid on regular interest dates, including interest on matured bonds of the St. Louis & Suburban Railway and the St. Louis Transit Company.

In addition to direct taxes, the United Railways expended $344,668 for paving and furnished free transportation for the police and firemen of St. Louis. There was also expended and charged to operating expenses an amount of $8,458 for carrying tracks over or around new sewers. The total taxes, street paving cost and expense on account of city sewer construction, were $2,196,081.

The total mileage in single track on Dec. 31, 1926, was as follows:

	Miles
City track	346.6873
County track	115.6328
Total	462.3201

During 1926, 0.09945 mile of track was added and 1.5544 miles was removed.

Since 1904 the amount of track reconstruction, renewal and extensions of track was as follows:

Year	Miles	Year	Miles
1904	21.56	1917	19.72
1905	8.90	1918	15.80
1906	29.18	1919	25.01
1907	21.65	1920	26.50

Average holiday	6	33,349	6	34,280	*931*	*2.42*

Holidays: New Year's Day, Decoration Day, Independence Day, Labor Day, Thanksgiving, Christmas.
Italics denote decrease.

The number of passenger cars owned at the end of 1926 was 1,587, of which 1,408 were motor cars, and 179 trail cars. This compared with 1,608 at the end of 1925, 1,638 at the end of 1924.

Twenty-one passenger cars and one work car were retired from service and destroyed during 1926. One hundred and fifty-one cars were remodeled by changing old type folding step to well-type step, with manually operated doors. One hundred and fifty-two cars were provided with special sash at conductor's booth to give conductor a clear view. Alterations were made on twenty-one trail cars by extending floor over "well" in center of car, and changes in conductor's booth. On 279 cars which had very narrow aisles, seven cross-seats on the open side and six cross-seats on the closed side were removed and replaced with longitudinal seats.

General overhauling and repainting	404
Car body and collision repairs	1,431
Truck and motor repairs	182
Revarnishing	317
Total	2,334

This total compared with a total of 2,305 cars in 1925 and 2,245 in 1924.

In the miscellaneous equipment eighteen buses were overhauled and repainted and 21 automobiles and trucks generally overhauled and repainted. In addition runabouts and coupes were purchased for the power and transportation departments.

Total number of employees on Dec. 31, 1926, was 5,888, compared with 5,811 on Dec. 31, 1925, 5,803 on Dec. 31, 1924, and 6,014 on Dec. 31, 1923. The maximum number of employees during 1926 was 6,122, compared with 6,269 in 1925 and with 6,361 in 1924. No changes in agreements as to wages and working conditions were made in 1926.

A continuously decreased labor turnover and the reaching of the fourth year scale of wages by an increased percentage of motormen and conductors made some increase in the average wages paid in the transportation department over previous years.

The safety director and his safety committees carried on extensive and intensive campaigns, holding a total of 283 meetings. As a result of this work, the company not only had the smallest number of fatalities, the smallest number of collisions with persons or animals or wagons, the smallest number of accidents connected with shops and sheds, the smallest number of car collisions, disturbances and employees injured, but for the third successive year a material reduction was made in collisions with motor vehicles, the number of such collisions in 1926 being approximately 2½ per cent less than in 1925, in spite of an increase of 14 per cent in the number of registered automobiles in the same year.

Of the 23 fatalities in which the electric railways were in any way concerned, there was only one in which United Railways operations appeared to be primarily at fault. Further, the 23 fatalities from all causes in 1926 compared, for example, with 49 in 1918 (the year before the receivership) and with 119 in 1904. It was also striking that with more than 6,000 employees there was only one fatal accident to an employee during 1926.

The membership of the Employees' Mutual Benefit Association at the end of 1926 was 5,327, including nearly all of those now eligible. Records show that approximately 50,000 medical and surgical treatments were given during the year to members and their families. On the whole, there was a slight decrease in the total number of cases coming under the supervision of the medical department in 1926, the number being about 24,000, compared with 26,000 in 1925. Physical examination of all new employees has been made increasingly thorough.

The Savings and Loan Association reports cash receipts for the year of $2,170,772, which includes members savings and money placed with the association in connection with the purchase of homes. One hundred and nine members finished paying off during the year loans previously made to them for building or buying homes, aggregating $259,711. Loans outstanding Dec. 31, 1926, numbered 1,366, or a total amount of $4,015,636.

The total miles in single main track of the Missouri Electric Railroad on Dec. 31, 1926 was 23.4838. Of this mileage, 7.6551 was double track and 7.8922 single track. In addition to the above there was 0.2814 mile of spur and miscellaneous track. This main track mileage includes 2.5139 miles of track of the St. Louis County Street Railway, which is operated as part of the Missouri Electric.

The number of revenue passengers on the Missouri Electric Railroad in 1926 was 2,779,989, compared with the 1925 number of 2,190,390, and the number on Missouri Electric Railroad buses in 1926 was 204,049, compared with the 1925 number of 22,450. This shows an increase of 35 per cent in the total number of revenue passengers in both electric railway cars and buses in 1926 over 1925.

CONSOLIDATED INCOME AND EXPENSE STATEMENT OF THE UNITED RAILWAYS, ST. LOUIS, YEAR ENDED DEC. 31, 1926

Book Reviews

Reference List of Literature on Urban Electric Railways

Boston, Mass.: Library Boston Elevated Railway, 160 pages.

The library of the Boston Elevated Railway, Boston, Mass., has an unusual position. Begun very early, it has always been regarded as one of the important departments of the company's activities, and being under competent guidance, it is not surprising that a wealth of literature has been collected. An even more important feature of this material than its abundance is that it has been thoroughly indexed. The latest aid to the users of this library is the publication of a list of the literature possessed on transportation topics in different cities, grouped under the names of the different cities, with a supplementary grouping by topics. Altogether the two lists occupy 160 pages. It would not be correct to say that the Boston Elevated Railway library contains all the printed information which has been issued on transportation in the different cities included, but it is not far from the truth to state that it possesses most of the information that is of the greatest importance. Hence, a list like this is invaluable to the student of transportation affairs in any particular city or in several cities. Nothing is said by the company as to the edition of this list printed, but it is hoped enough are available so that some of the other electric railway libraries can be supplied.

Principles of Mercury Arc Rectifiers and Their Circuits

By David Chandler Prince and Francis Brooke Vogdes, General Electric Company, New York: McGraw-Hill Book Company, Inc. 233 pages. Price, $3.

This book consists of two parts. One considers the rectifiers themselves and the other a study of the circuits in which they operate. The usual condensation of mathematical work for the sake of having it appear in concise form has not been followed, but instead the authors have picked out such mathematical processes as best set forth to their minds the physical conceptions of the problems discussed and have eliminated lengthy algebraic transformations.

The book begins with a discussion of the physics of several simple types of rectifiers and ends with the mercury-arc rectifier. In this, the first part of the book, the authors have included the results of many workers as well as a description of their own work.

In the second part of the book the authors have made use of a mathematical paper by Walter Dällenbach and Eduard Gerecke on the current and voltage conditions in a high-capacity rectifier. This deals with a condition in the rectifier circuit having all the reactance in the secondary winding and the method is indicated whereby more difficult problems can be solved. No attempt has been made to discuss the details of rectifiers as constructed by the various manufacturers at present or the conditions under which they operated.

Office Management

By John H. MacDonald, M.C.S. Prentice-Hall, Inc. 278 pages. Price, $5.

Men, materials, money, methods and machines, their relationship and service to modern business principles and practices are shown in John H. MacDonald's new book, "Office Management." The author has compiled methods which he has worked out in two or three of the largest institutions in the country, and combined research for the last five years, and put them in his text. Mr. McDonald says:

> Business has made rapid strides in the past few years in applying to the field of office management the same fundamental principles of procedure and methods that have been in successful use for years in production work. Present day competition, resulting as it has in smaller margins of profit, has made it essential to give the most careful attention to the efficient organization and management of internal administrative affairs in order that individual productivity may be increased and unit costs reduced.

The growth of business, dependent upon record, is shown by the increase in clerical employees in the United States from 1,631,626 in 1910 to 2,951,008 in 1920. The mass of detail of operation of such large corporations as the Westinghouse Manufacturing Company and the New York Telephone Company, for example, are gathered together, compared and analyzed; and the practices of these various companies are theorized into what might be called a "guide to better business."

Twenty-three chapters are set up under the heads of the numerous departments of an organization such as the advertising, sales, purchasing, mailing, stenographic and filing departments. The subjects are well divided under subheads which tell the story and make it easier for the reader to pick out his point of interest very easily. It tells of the historical background of office management, and dips into the psychology of selection of employees. And with the charts scattered throughout the book, the trends and workings of the companies are well illustrated. The banner chapter, perhaps, "Payment of Office Employees," discusses scientific salary administration.

Every electric railway and manufacturer might very profitably keep this book not on the shelf but on the desk of its executive and administrative officers for their use in direction, control and co-ordination of the organization in which they serve.

Fifty Year Jubilee Volume

By the Maschinen Fabrik Oerlikon, Zurich. 192 pages.

Not many manufacturers now active in the electrical business can show an unbroken existence of fifty years. This, however, is the record of the Maschinenfabrik Oerlikon, which began in 1863 under the name of P. E. Huber & Company. The name was changed in 1876 to Werkzeug- und Maschinenfabrik Oerlikon and in 1886 to the shorter present name. During all this time members of the Huber family were continuously and actively connected with the management as they still are. The volume just issued, commemorating the 50 years' life of the company, is beautifully printed and illustrated. Its contents might be divided into two parts.

The first gives the history of the company and is accompanied with views and data of its plant as it exists today. The second part of the book is devoted to the technical aspects of the company's products, among which, of course, electric railway apparatus has constituted an important part. As early as 1884 the company was conducting tests with experimental electric railway equipment, and in 1888 supplied the electrical apparatus for the first fully equipped electric railway in Switzerland, the line between Vevey, Montreaux and Chillon. From these early efforts to the latest single phase locomotive which the company has built for the Swiss Federal Railways is a long step. The book contains full particulars of this later work in electric locomotive design, of generator and turbine construction and other branches of the output of the company.

Electric Switch and Controlling Gear

By Charles C. Garrard. New York: D. Van Nostrand Company, Inc. Third edition. 784 pages. Price, $18.

The third edition of this book has been revised considerably to correspond with rapid developments which are taking place continually in switch and controlling gear. The main object of the book is to classify this equipment, and to state the principles underlying its design and construction. No attempt has been made to describe all of the products of the different manufacturers. The descriptions given are intended to be representative examples, or for illustrating special principles. Mathematical compilations have been kept as simple as possible, and particular consideration has been given to progress in detailed standardization of switch gear.

The book is divided into eight chapters with ten appendixes. Subjects treated include material and manufacturing methods, apparatus for making and breaking electric circuits, apparatus for preventing a dangerous condition of current, apparatus for regulating the amount of current, apparatus for starting and controlling electric running machinery, low and medium tension switchboards, high tension and extra high tension switchboards and apparatus for protecting electrical machinery, against abnormal electric conditions.

Personal Items

Two New Vice-Presidents at Atlanta

Charles A. Collier and Frank E. Shumate were elected vice-presidents of the Georgia Power Company, Atlanta, Ga., at the last meeting of the board of directors in Atlanta. Mr. Collier, general sales manager prior to his recent election, was named vice-president in charge of the sales department and Mr. Shumate, who was general attorney, was named vice-president in charge of the law department. Both officials, native Georgians, have been connected with the Georgia Power Company for many years.

Mr. Collier entered the service of the company in March, 1909, following completion of his education at the Georgia School of Technology. Beginning as an inspector of wires and motors and managing small power sales, Mr. Collier advanced rapidly to higher posts in the sales department. There he remained for eighteen years. In February, 1922, he was appointed to the post of general sales manager.

Mr. Shumate became associated with the company in 1919, after having served in the legal department of the Southern Railway in Atlanta, since 1912. He accepted a position as general counsel of the then called Georgia Railway & Power Company and subsidiaries, his duties to that organization being chiefly executive. As a youth he studied law in Dalton, Ga., in the office of his father, the late Col. I. E. Shumate, a foremost lawyer in Georgia in his time.

Julius Theobald with Ohio Company as Manager

Julius Theobald, formerly general superintendent of the Atlantic City Electric Company, Atlantic City, N. J., has been appointed general manager of the Springfield Electric Company, Springfield, Ohio. He succeeds the late P. E. O'Brien. Mr. Theobald has been in Springfield for the last few months as assistant to Mr. O'Brien and performed most of the duties of the general manager during Mr. O'Brien's last illness.

After leaving Ohio State University with the class of 1897 Mr. Theobald almost immediately entered the public utility field by securing employment with the Columbus Edison Company, now known as the Columbus Railway, Power & Light Company and after several years of apprenticeship with the company he entered the service of the Locomobile Company of America at New York.

The Duquesne Light Company, Pittsburg, next placed him in charge of the business department of the entire Monongahela territory. It was at this time that he joined forces with Van Horn Ely, president of the American Railways, now the American Electric Power Company. For fifteen years he was responsible for the operation of several of the subsidiaries of the company. He went from that company to the Atlantic City Electric Company as general superintendent.

H. H. Dartt Vice-President and Manager at Scranton

H. H. Dartt has been made vice-president and general manager of the Scranton Railway, Scranton, Pa., to succeed Jilson J. Coleman, who died in April. Mr. Dartt began work with the Scranton Railway in 1910 as engineer of maintenance of way. In 1926 he was made operating manager, in which capacity he served until his recent appointment.

H. H. Dartt

Mr. Dartt's connections before going with the Scranton Railway were varied. Upon completion of his course of study at Mansfield State Normal School, Mansfield, Pa., he became interested in coal mining and lumbering and worked with his father in these two fields. After four years he left this work and became an engineer for the Northwestern Mining Exchange Company at Dubois, Pa. This was for a short period only. His next connection was with the Lehigh Coal & Navigation Company at Mauch Chunk, Pa. This company he served as field engineer.

In 1908 Mr. Dartt removed to Scranton, where he worked for the Delaware, Lackawanna & Western Railroad. Two years later he joined the Scranton Railway as engineer of maintenance of way, as previously mentioned.

Charles H. Forsgard, who has been general superintendent of the Durham Public Service Company, Durham, N. C., has been appointed to the Community Traction Company, Toledo, Ohio. Mr. Forsgard will succeed James Ashton Gregg, resigned, and will take over the duties of E. B. Emery who will be transferred to the New York office of Henry L. Doherty & Company, managers of the Toledo property, in the capacity of special investigating engineer in the operating department of that company.

Changes Made in Maryland Commission

Ezra B. Whitman, a member of the Maryland Public Service Commission since 1921, has resigned and will be succeeded on the commission by Steuart Purcell, now head of the Bureau of Highways of Baltimore. Mr. Whitman was made chairman of the commission in 1924, but resigned several months later, continuing as a member. He was chairman of Mayor Howard W. Jackson's commission on economy and efficiency, which brought about a reorganization of all the engineering and other departments of the municipal government. Mr. Purcell will devote all his time to the work of the Public Service Commission.

William J. Carr, who was appointed a member of the Railroad Commission by Governor C. C. Young to fill the unexpired term of the late Harley W. Brundige, assumed his duties with the commission on Aug. 5. Mr. Carr is a resident of Pasadena. He was engaged in the practice of law in Los Angeles, when named to the commission. He served as a member of the California Senate during the sessions from 1913-1921 inclusive.

C. H. Mobbs, Springfield, Mass., has resigned his position with the Springfield Street Railway and the Worcester Consolidated Street Railway to join the sales force of the Bemis Car Truck Company, Springfield, as New England representative. Mr. Mobbs is well known among the railway fraternity, having been in charge of the freight and express business of the Springfield and the Worcester companies for the past fifteen years.

OBITUARY

Louis Koepff, an employee of the Southern Indiana Gas & Electric Company, Evansville, Ind., died recently. He was 73 years old and the oldest employee of the company, having been with the corporation for more than 57 years. His first position with the company was "lead boy" for the horses and mules which pulled the cars a half century ago.

James G. Balfour, for many years a director of the Union Traction Company, an underlier of the Philadelphia Rapid Transit Company, Philadelphia, Pa., died on Aug. 7. Mr. Balfour was a former memmer of the Philadelphia Stock Exchange. He was 57 years old.

Manufactures and the Markets

Seven More Railroads Order Gas-Electric Cars

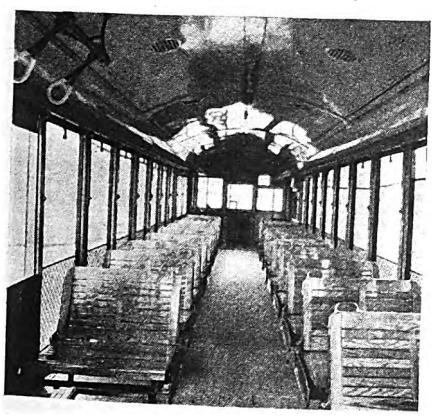
Approximating $1,000,000 in value, more than a score of combination passenger, baggage and mail Brill-Westinghouse gas-electric cars have been placed under contract by seven different railroad companies, including the Alaskan Railroad line, operated by the Department of the Interior, according to announcement made by Thomas Cooper, manager of the transportation division of the Westinghouse Electric & Manufacturing Company Philadelphia office.

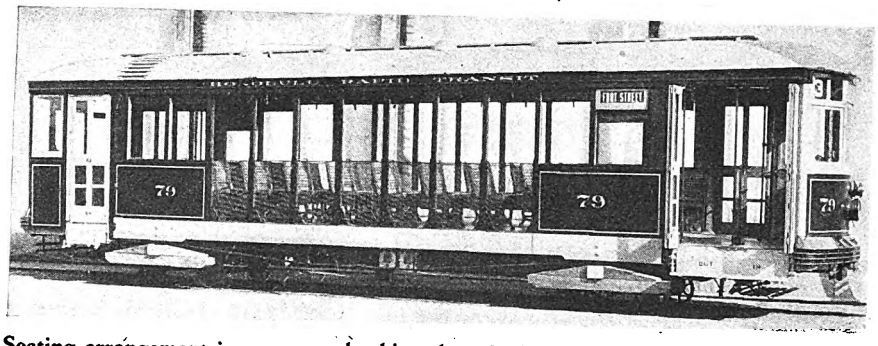
The new cars range in length from 60 ft. to 73 ft. and will be equipped with the Brill-Westinghouse gas-electric power unit of 250 hp. Orders for the new cars placed include four for the Baltimore & Ohio Railroad, eight for the New York Central Railroad, including one car with a double-power unit, giving it a total of 500 hp.; six cars for the New York, New Haven & Hartford Railroad, two cars for the Central Railroad of Vermont and one car each for the Atkinson, Topeka & Santa Fe, the Lehigh Valley Railroad and the Alaskan Government Railway.

This last car, which has been designed particularly with a view of its use in operating under severe weather conditions, will be run from Seward to Fairbanks via Anchorage, Alaska, a round trip distance of 945 miles of perhaps the roughest traveling in any part of the world.

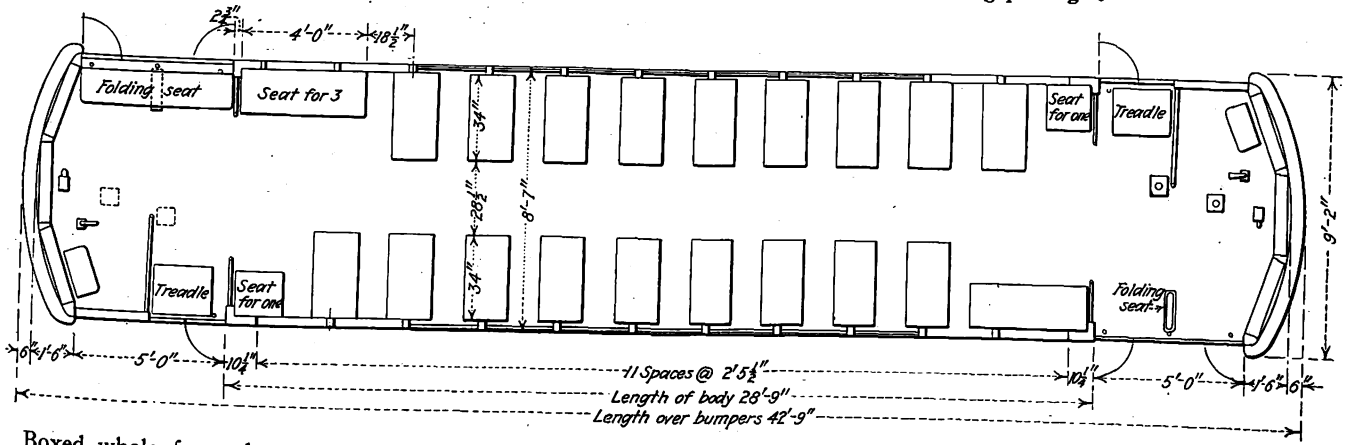
With the exception of the New York

Eight Cars Shipped to Honolulu by the Brill Company





Seating arrangement in cars recently shipped to the Honolulu Rapid Transit Company
At left—With this cool interior to its new cars the Honolulu Utility should have little trouble in attracting passengers



Boxed whole for a long sea voyage and shipped in two lots, eight new one-man, two-man, double-truck units are now somewhere en route between Philadelphia and Honolulu, T. H. They form a completed order placed in December, 1926, by the Honolulu Rapid Transit Company, Ltd., Honolulu, T. H., with the J. G. Brill Company of Philadelphia, Pa. Each unit has four Westinghouse 510-E inside hung motors and is equipped with Brill-177-E-1 trucks of wood construction; they weigh 38,880 lb. and have an over-all length of 42 ft. 9 in. The cars are of the semi-open type, screened on the sides to the height of the window sill. Safety car appliances of the Safety Car Devices Company are part of the equipment.

A. E. Kirk, assistant manager of the company, has reported the accompanying specifications.

Number of units	8
Type of unit, one-man, two-man, motor, passenger, city, double end, double truck.	
Number of seats	48
Builder of car body	J. G. Brill Company
City and state	Philadelphia, Pa.
Date of order	Dec. 4, 1926
Weights:	
Car body	21,370 lb.
Trucks	95,560 lb.
Equipment	7,950 lb.
Total	38,880 lb.
Bolster centers	22 ft. 11 in.
Length over all	42 ft. 9 in.
Length over body posts	28 ft. 9 in.
Truck wheelbase	5 ft. 1½ in.
Width over all	8 ft. 7 in.
Height, rail to trolley base	11 ft. 0¾ in.
Window post spacing	29½ in.
Body	Wood frame
Roof	Arch
Doors	Front, rear treadle
Air brakes	General Electric
Armature bearings	Plain
Axles	A.S.T.M. standard 4½ in.
Car signal system	Faraday
Compressors	General Electric C.P.-27 B
Conduit	Metal
Control	Westinghouse K-35-KK
Couplers	Link
Curtain fixtures	Acme
Curtain material	Pantasote J-86
Destination signs	Hunter illuminated
Door mechanism	National Pneumatic
Doors	Outside folding
Fare boxes	Johnson type D-3M
Finish	Enamel
Gears and pinions	Tool steel, helical
Glass	Plate
Hand brakes	Peacock staffless
Hand straps	Rico No. 5
Headlights	Golden Glow SM No. 95
Headlining	Agasote
Interior trim	Natural wood, bronze
Journal bearings	Plain
Journal boxes	3¼ in. check plate type
Lamp fixtures	Plain sockets
Motors	Four Westinghouse 510-E, inside hung
Painting scheme	Tuscan red, yellow trim
Roof material	No. 8 canvas
Safety car devices	Safety Car Devices Company
Sash fixtures	Bronze
Seats	Brill Winner Admore on platforms
Seat spacing	29½ in.
Seating material	Wood slat
Steps	Folding
Step treads	Feralun
Trolley catchers	Knutson No. 10
Trolley base	U. S. No. 13
Trolley wheels	Feist
Trucks	Brill-177 E-1
Ventilators	Brill exhaust
Wheels	steel, 26 in. diameter
Wheelguards	Root all steel
Special devices: Nichols-Lintern rear signal light; TA handle switches on control; one car equipped with twin swing links.

Central and the New Haven cars, which are to be respectively 73 ft. in length, the new units will have a standard length of 60 ft. The gasoline engines, which are of a design developed by the Brill automotive engineering section, are being made at the South Philadelphia Works of the Westinghouse Electric & Manufacturing Company. Upon completion, the motive equipment, both gasoline and electrical, is being shipped to the Brill Works, where the construction of the cars is meanwhile being rushed to completion.

60 New Electric Units Ready for Service on Long Island Railroad

PART of a $2,902,286 car order announced in the JOURNAL for Feb. 12 for the Long Island Railroad, New York City, is now being delivered. It consists of 60 motor, passenger, suburban, double-end cars. The units, of all-steel construction and embodying every modern device, are being delivered by the American Car & Foundry Company, Berwick, Pa.

They are equipped with Westinghouse No. 308G-1 inside hung motors. Each coach has an over-all length of 64 ft. 5¾ in. and a seating capacity of 78 passengers. Total weight of each unit is 114,700 lb. Commonwealth cast-steel trucks are on all the units. The painting scheme is the standard red color of the company. In general design, the new rolling stock is the same as that which was fully described in the JOURNAL for Feb. 2, 1924.

According to an announcement by George Le Boutillier, vice-president of the road, made in ELECTRIC RAILWAY JOURNAL Feb. 12, the Long Island will have 100 per cent steel equipment both on its electric and steam divisions by the end of 1927. The company's expenditure in order to eliminate the wooden type car from its rolling stock represents an outlay of $5,000,000.

Detailed in Mr. Le Boutillier's February statement was the placing of an order for 127 steel passenger cars, representing an investment of $2,114,188, which included 117 coaches and ten combination baggage and passenger cars. This was in addition to the $2,902,286 expenditure authorized in 1926 and which included, besides the 60 motor cars now being delivered, 30 trail cars for electric service and twenty coaches and four combination cars for steam service. All the units will be so constructed as to permit of conversion to electric operation. When all the orders are completed the Long Island will have a total of 1,411 steel passenger-carrying units.

Official specifications for the 60 motor cars, just announced by G. C. Bishop, superintendent of motive power, are as follows:

Number of units	60
Type of unit	Motor, passenger, suburban, double end, double truck
Number of seats	78
Builder of car body	American Car & Foundry Co.
City and state	Berwick, Pa.
Date of order	October, 1926
Date of delivery	May, 1927
Weights:	
Trucks—Motor	19,540 lb.
—Trailer	17,420 lb.
Total	114,700 lb.
Bolster centers	39 ft. 9 in.
Length over all	64 ft. 5¾ in.
Length over body posts	54 ft. 3¾ in.
Truck wheelbase—Motor	8 ft. 6 in.
—Trailer	7 ft. 4 in.
Width over all	9 ft. 10½ in.
Height over all	13 ft. 8½ in.
Window post spacing	34 in.
Body	All steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Motor truck 5½x10; trailer truck 5x9
Car signal system	Electropneumatic
Compressors	Westinghouse D3-F
Conduit	Metal
Control	Westinghouse electropneumatic
Couplers	Sharon special
Curtain fixtures	National Lock Washer
Curtain material	Pantasote
Door mechanism	National Pneumatic
Doors	Sliding
Finish	Paint
Floor covering	Monolith
Gears and pinions	Nuttall
Glass	Non-shatterable at motorman's station; 3902 in carbody
Hand brakes	Lindstrom
Heat-insulating material	Salamander
Heaters	Gold Car Heating Company, electric
Headlights	Electric Service Supplies Company
Headlining	Steel
Interior trim	Steel
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	GE No. 50746
Motors	Two Westinghouse No. 308G-1, inside hung
Painting scheme	Red
Roof material	Steel
Sash fixtures	National Lock Washer
Seats	Heywood-Wakefield
Seat spacing	31½ in.
Seating material	Cane
Slack adjusters	Westinghouse
Steps	Stationary
Step treads	Diamond pressed plate
Trucks	Commonwealth cast steel
Ventilators	Automatic
Wheels, type	Rolled steel, 36 in. diameter
Special devices	Automatic inductive train stop

General Electric Men Move Up Ladder

Burton L. Delack, assistant manager of the Schenectady works of the General Electric Company since Dec. 1, 1926, has been appointed acting manager. Mr. Delack fills the vacancy caused by the promotion of C. E. Eveleth, elected a vice-president on June 1 of this year.

Edward A. Wagner, formerly of the Fort Wayne works but since July, 1926, managing engineer in charge of all distribution transformers, with headquarters in Pittsfield, has been made acting manager of the Pittsfield works, succeeding Mr. Chesney, who has been vice-president in charge of manufacturing since the retirement of F. C. Pratt.

Giuseppe Faccioli, works engineer of the Pittsfield works, has been appointed associate manager and works engineer of the Pittsfield works, Mr. Chesney announced.

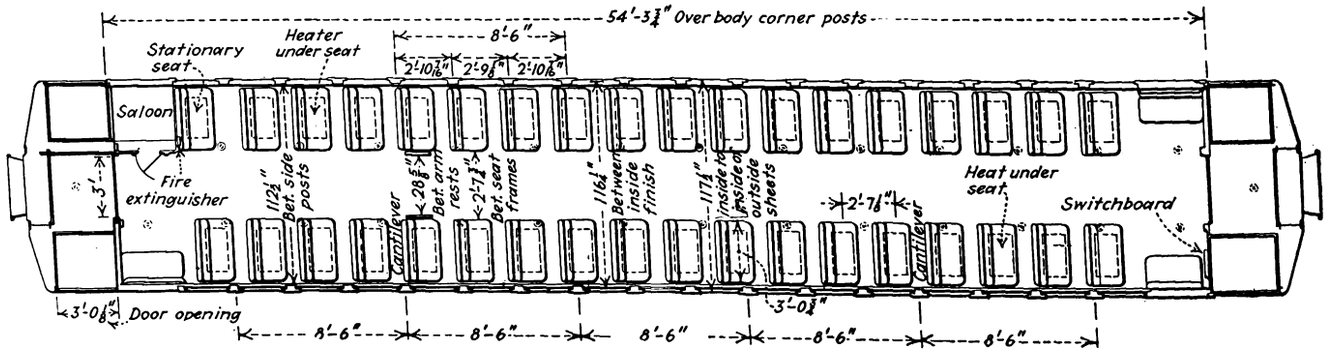
Ten Cars Ordered by Macon Railway & Light Company

Macon Railway & Light Company, Macon, Ga., has placed an order for ten cars with the Perley A. Thomas Car Works of High Point, N. C., for delivery in the fall. This order was forecasted in ELECTRIC RAILWAY JOURNAL for April 9, at which time the order was dependent upon action by the City Council on an increased fare petition.

Anchor Post Fence Company to Build Factory in Baltimore

The Anchor Post Fence Company of New York and Cleveland, manufacturer and erector of chain link and similar types of wire fences, gates and railings, has acquired control of a site in Baltimore for the erection of a new manufacturing plant. The site selected is in the eastern industrial section of the city, having direct rail connection, by means of the Canton Railroad, with both the Baltimore & Ohio and the Pennsylvania roads. It is within a short distance of the new plant of the Bethlehem Steel Company at Sparrows Point.

The first unit to be erected will be a one-story steel and concrete manufacturing and storage building, 200 ft. wide by 500 ft. in length. The building is to be equipped with an overhead traveling



Seating plan for 60 electric units now ready for service on the Long Island Railroad.

Digitized by Google

crane, weaving looms, a continuous galvanizing unit and is to have every facility for the economical manufacture and handling of its products.

The company now operates plants at Cleveland, Ohio, and Garwood, N. J., and distributes its products through branch sales offices and agents throughout the country.

The Austin Company, Cleveland, is the general contractor. Building operations were started in June and the structure is scheduled for completion in the fall.

Copper, Lead and Zinc Prices Off

A reaction occurred during the week ended Aug. 10 from the activity and strength that have characterized the metal markets recently. The damage done has not been great, however, and with stronger London quotations the last two days of the week sentiment seems improved.

Most of the large producers have continued quoting 13⅜ cents delivered to usual Eastern points of consumption. A fair amount was sold on Aug. 4 and 5 at these prices, but later this quotation has become almost entirely nominal. Following the recent good buying, and in view of the pronounced drop in London on Aug. 8, most consumers became disinterested, and prices as low as 13.20 to 13.25 cents, delivered Valley, were necessary to tempt some of them. Such quotations were not general and some copper sold on Aug. 10 as high as 13¼ cents in the Middle West. The export association has continued its 13.65 cents c.i.f. price, but foreign buying has been as quiet as domestic.

The only change in the lead situation is a slight softening of the price in the St. Louis district, where some metal is obtainable at 6.475 cents, or possibly 6.45 cents. The American Smelting & Refining Company has maintained its official contract price for New York lead at the 6.75 cent level established during the week ended Aug. 3. In some instances a slight premium has been obtained, and on the other hand the price has been shaded by dealers yesterday and today. In the Middle West the leading interest has been at 6.55 cents most of the week, although 6.50 cents has been quoted to regular customers to meet the "outside" market.

Though the price of zinc has reacted from the high of 6.45 cents of a week ago, selling for as low as 6.30 cents, St. Louis, in the week ended Aug. 10, a slightly firmer tendency is now noted, with most producers quoting 6⅜ cents.

Tin eased in both the foreign and domestic markets on Monday, but closed the week with Straits in New York slightly higher than during the previous week. The premium of Straits over 99 per cent is narrower than it was a month ago, because the lower-grade metal is not so plentiful for prompt delivery as it had been. October delivery is quoted at only about ¼ cent under prompt.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Aug. 9, 1927

P. O. Reyneau Joins Cutter Company

Paul O. Reyneau has affiliated himself with the Cutter Electrical & Manufacturing Company of Philadelphia, Pa For the past 3½ years he has been consulting engineer for the American Gas Company, Philadelphia, remaining with that organization until its recent merger with the United Gas Improvement Company.

Mr. Reyneau's first electrical work was an an employee of the Telluride Power Company. He then continued his technical education at Cornell University, from which institution he was graduated in 1913. Immediately after graduation he became identified with the overhead lines department of the Detroit Edison Company, subsequently serving as distribution engineer and still later as assistant electrical engineer, holding the last named position until his resignation to become affiliated with the Philadelphia Electric Company in charge of transmission and distribution design. It was in 1923 that he joined the American Gas Company.

Tank Car Company Merger Denied

Denial has been made by F. N. Hoffstott, president of Pressed Steel Car Company, of the reported impending merger of his company with the General American Tank Car Company. According to Mr. Hoffstott no proposition for a merger between the companies has been put up to the directors or stockholders of Pressed Steel Car.

Electric Locomotives Delivered to South Shore

Two new 57-ton electric freight locomotives recently purchased by the South Shore Line from the Westinghouse Electric & Manufacturing Company were recently delivered and are now in regular service. These locomotives are of a lighter type than others owned by the company and are to be used in switching and work train service, replacing others for use in the rapidly increasing freight service.

Cotton Shortage Sends Electrical Supplies Up 5 Cents

By Robert E. Dunne
Mitchell-Rand Manufacturing Company, New York City

FOR some time a number of textile mills catering to the electrical trade have been prosperous without profit. That is, they have been running on fairly large quantities of material, but at prices that did not compensate them for their investment of capital, labor and material. This condition could not endure forever and already several producers have withdrawn the extremely low prices made during the latter part of 1926 and early 1927.

Competition has been so keen that no one dared take the initiative in advancing prices until a universal reason presented itself. Encouraged by the reported cotton crop, which will be considerably less than last year, due partly to the reduction of available cotton acreage in the flooded Mississippi Valley and an increased consumption, prices have advanced from 12 cents to 18 cents per pound.

This is not a startling condition, but the purchaser must pay a higher price for cotton products during the second half of 1927 then he did during the first half, as supplies of the low-priced cotton of late 1926 and early 1927 are now exhausted and prices of finished products will be figured on the higher price for raw cotton.

Another factor, which is probably more indicative of a stronger market and higher prices than the measuring of the cotton crop of last year against the estimated crop of this year, is the astounding increase in consumption and the quantities of unfilled orders on hand in the general textile field.

In the *Cotton Textile Bulletin* the substended compilation appears:

Six Months Statistics Show Large Sales of Cotton Goods

Statistics for June and consolidated reports for the first six months of the year covering the production and sales of more than 200 classifications of standard cotton cloths, as compiled by the association for 1926 and 1927 are summarized below (000's of yards omitted) as follows:

When the mills have so large a quantity of unfilled orders on hand, and when the reported cotton crop is less than the previous year one cannot expect any recession of price, but must expect a slightly higher price level than is existent, especially as many mills have been taking business that has been unprofitable.

The conditions outlined above refer to the general textile field, of which the demands of the electrical industry are but a small part, but that part of the cotton industry applying to the electrical trade must move with the whole.

	June		Change in Per Cent from 1926	Six Months		Change in Per Cent from 1926
	1926	1927		1926	1927	
Production	225,807	279,456	+23.7	1,321,052	1,487,387	+12.6

ROLLING STOCK

Kansas City, Leavenworth & Western Railway, Kansas City, Kan., has placed an order for four combination passenger, baggage and lounge cars with the American Car Company, St. Louis, Mo.

Carolina Power & Light Company, Raleigh, N. C., has ordered four special safety motor bodies on Brill 79-E-2 trucks from the J. G. Brill Company, Philadelphia.

Capital District Transportation Company, bus operating subsidiary of the United Traction Company, Albany, N. Y., has received twenty Mack city type, gas-electric drive, 233-in. wheelbase buses. These buses have six-cylinder motors, General Electric generators and single electric motors. Seating capacity of each bus is 29 passengers. This delivery brings the Mack fleet of this operator up to 50 gas-electric buses in service in Albany, Troy and Rensselaer.

Sioux Falls Traction System, Sioux Falls, S.D., has purchased two additional model 53 White buses. This line now has a White bus fleet of thirteen.

Northern Texas Traction Company, Fort Worth, Tex., will supplement its street car service in Fort Worth with five new 21-passenger motor buses, A. J. Rowe, assistant manager of the company, announces. Four buses of this kind already are in operation in this city.

St. Louis Bus Company, bus operating subsidiary of United Railways, St. Louis, Mo., has accepted delivery of two White buses, model 53, bringing the number of White buses used in coordinated service by this system in St. Louis to 36.

TRACK AND LINE

International Railway, Buffalo, N. Y., has notified the City Council that it will proceed with track reconstruction and paving on Fillmore Avenue as soon as the necessary materials are delivered about Aug. 15. The company announces that during the balance of the current year it will spend $250,000 on track reconstruction and paving on streets approved by the municipal authorities. This is $100,000 more than the expected additional revenue from the 10-cent fare authorized by the Public Service Commission during the same period.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., has placed new street car tracks on the south side of Alabama Avenue from Lake Avenue to Carnegie Avenue, for use of the Hyde Park cars. The track on the north side of Alabama Avenue formerly used by these cars, will be removed.

TRADE NOTES

Lincoln Electric Company, Cleveland, Ohio, announces that the Missouri district office has been moved from 1808 Railway Exchange Building, St. Louis, to 1003 Davidson Building, Kansas City, Mo. Robert Notvest is in charge. The St. Louis district will be handled by Mr. Notvest also, his time being divided between the two cities. A branch has been established at 220 Nicholas Building, Toledo, Ohio, A. H. Homrighaus, formerly in charge of the Missouri District, being in charge of this district.

Bridgeport Brass Company, Bridgeport, Conn., announces the appointment of William S. Kriebel, Jr., Philadelphia, as salesman of Bridgeport Brass products in the Philadelphia territory. He will make his headquarters at the Bridgeport Brass Company's Philadelphia office, located in the Bankers Trust Building.

Waukesha Motor Company, Waukesha, Wis., manufacturer of heavy-duty Ricardo Head industrial and vehicle engines, has opened its new Eastern sales office at 8 West 40th Street, New York City. The New York office was formerly in the Aeolian Building, 33 W. 42d Street, New York City.

ADVERTISING LITERATURE

National Paving Brick Manufacturers Association, Chicago, in its July, 1927, issue of "Dependable Highways" tells of the merits of using brick for paving the street car track area.

Crouse-Hinds Company, Syracuse, N. Y., has recently issued bulletin No. G-2 on groundulets and other safety circuit devices, bulletin No. 308 on floodlight projectors, folder No. 51 describing the new Obround condulet, and bulletin No. 2098 on self-threading unions and connectors.

He Raised the Standards of American Business

THE passing of Elbert H. Gary, chairman of the board of the United States Steel Corporation, has brought a flood of eulogistic messages from civic and business leaders throughout the civilized world. As the master mind and personality behind the largest industrial organization in the country, his business judgment and organization genius were universally recognized. But his death has thrown into sharp relief phases of his life and accomplishments not so generally known. In the words of President Coolidge, expressed in a message of sympathy to Mrs. Gary, "He stood foremost among those who find in the great private enterprises of our country an opportunity for public service as well as a medium for financial profit."

Business and industrial leaders throughout the country caught the same note in interpreting the outstanding accomplishments of the man. "He did most to restore conscience to business." "He was more than a captain of industry, he was a statesman of industry." "He led in the great movement to elevate industry to its present high plane of business and social morality and justice." "He stood for fair competition—he was the statesman of business." "He will be remembered as the outstanding man who conceived the idea of competitive co-operation rather than competitive strife in industry." In short, his greatest accomplishment was not that he conceived, organized and managed successfully the largest industrial enterprise in the country, but that he used the opportunity and the power that these immense resources gave him to raise the standards of American business. He used private enterprise as the means of rendering a public service.

There is an inspiration to all business in these interpretations of Judge Gary's life and accomplishments. This is particularly true of the utility business. Here we are engaged directly in a public service through private enterprise. This business is built on the foundation principle of combining private initiative and efficiency with the public interest. In that respect American utilities as a whole are unique among those of the world. Therein lies the secret of their marvelous development and efficiency. Private initiative and driving power have far outstripped the cumbersomeness and inertia of bureaucracy applied to the management of utilities.

Judge Gary saw the opportunity for public service in what to many would appear to have been purely a private enterprise. He not only conceived the idea, but he applied it. Then he exposed his handiwork to the pitiless spotlight of publicity. Through that he won the public confidence. He demonstrated that size and power in an industrial organization are not necessarily inimical to the public interest. In fact, he proved that it is entirely possible to direct such immense private forces as an active champion of the public welfare. And he proved likewise that unswerving adherence to such a policy is good business. It is upon the ability of its leaders to maintain "The Public Service" clean and untarnished on the escutcheons of the utility industry that the future progress and welfare of that business depends.

Getting the Most Out of Scrap Material

EFFICIENT handling and disposal of scrap material from electric railways have been long neglected. Only during the last few years has the disposition of such material been conducted along effective lines in a systematic manner. The scrap pile has been one of the greatest sources of waste in railway shops. In many places all parts, regardless of the material of which they are constructed, which had outlived a period of usefulness were thrown indiscriminately into ungainly heaps. No attempt was made to discover any additional value that might be left or to grade the material so as to obtain a higher price for it as scrap. That the various parts were worn out and no longer useful for the original purpose settled the matter. All was considered scrap, just so much waste that must be disposed of.

A scrap pile is never a thing of beauty. Nothing about it adds to the orderly appearance of the yard. These heaps of dead material take up space which could be used for more profitable purposes. When the space is required it is felt that the scrap must be removed as quickly as possible. This condition always made the junk business profitable. Railways that were continually having accumulations of waste matter were approached by dealers in junk, and for a nominal price they got all of it that they could handle. The junkman made the terms and the railway was satisfied if the piles were removed as quickly as possible. In these piles of iron and steel parts everything was considered as iron and bought by the dealers as such. On some properties accumulations amounted to as much as twenty tons a week. If this were sold at $3 per ton, or $3,120 a year, the company felt quite satisfied.

The more progressive properties, however, have realized that there is a considerable demand at the rolling mills for scrap iron and steel, so that now they not only sort the different materials but also place the several grades of steel in different piles, and each is sold at a price more nearly proportionate to its real value. Often the junkman has been done away with entirely, the purchasing department dealing directly with the steel mills. Non-ferrous metals, such as copper and brass, are also graded and sold to neighboring brass foundries. This

This is the issue in August that is devoted essentially to maintenance and construction subjects

Digitized by Google

method has not only increased the income of the railways but it has also improved the appearance of the property, as the materials are kept in neater condition and can be disposed of at such frequent intervals that large accumulations never occur.

Perfection Can Be the Goal

NO LESS an authority than Michelangelo is responsible for the famous axiom "Trifles make perfection and perfection is no trifle." The thought comes to mind immediately when one ponders the performance of the emergency division of the United Railways & Electric Company of Baltimore, which recently celebrated in recognition of having gone 58 consecutive days without a trolley wire break. This performance is in itself remarkable in a city the size of Baltimore, with intensive car service on many streets. It is still more remarkable in view of the reduction in the number of breaks from 1,321 in 1918 to fifteen for the first seven months of this year.

With a record such as this, the term "emergency division" is something of a misnomer, as General Manager H. B. Potter pointed out at the dinner. The result was brought about only by a most thorough study of the mechanics of the trolley pole, the trolley wheel, the wire and its supporting structure, followed by vigilant supervision and unceasing inspection of the overhead work.

Undoubtedly the cost of this careful method may be greater than when the wire is allowed to go until a break occurs, and then only to make the repair which has become necessary through failure. But the report of the failure is invariably made on account of delay occasioned to one of the revenue cars in service, and the resultant difficulty of operation, if movement of cars is at all possible, will cause losses of revenue far greater than any saving that may be made by reducing the emergency force and eliminating the careful supervision necessary.

Nothing has been done in Baltimore that cannot be repeated elsewhere. Every railway has the same possibilities for giving 100 per cent service. While the weather is more moderate in Baltimore than in some Northern cities, it is only a question of selecting the correct type of construction and the proper materials for the climate and service. Here is one instance where the way has been shown to perfection, and perfection alone is the goal.

Get Your Luncheon Tickets Early

ANNOUNCEMENTS made by Chairman H. L. Brown for the committee having in hand the program of the coming Cleveland convention arouse unusual interest and anticipation regarding this annual "get-together" of the local transportation industry. There is in the plan of the program a promise of all those elements which should make it of maximum inspiration and practical value.

An unusual feature is the series of informal luncheon conferences planned for Tuesday, Wednesday and Thursday. There will be no formal addresses at these meetings. The time will be devoted entirely to "across-the-table discussion." A subject will be designated for each luncheon and a sponsor will be named to start and direct the discussion. Attendance at each of these meetings will be limited to 50, so as to insure informality. The purpose is to permit executives, by selecting one luncheon each day from a number being held simultaneously, to take part in a meeting devoted to that subject in which they are at the moment most interested.

Obviously it is impossible during the limited period of a convention to give adequate consideration to the many topics of interest to the transportation executive. By this plan of permitting selection of subjects, it was the purpose of the committee to cover the entire range, but to permit each executive himself to select the subject to which he wished to devote the limited time available.

This arrangement respresents a considerable departure from previous electric railway conventions. The committee is to be commended for its enterprise in thus making a distinct effort to increase the practical value of the program. The success of the scheme will depend upon two major factors: First, the co-operation extended by the executives of the industry in making their luncheon selections early so as to permit advance arrangements to be made; the second condition for success is that executives catch the spirit of these meetings and use them for the purpose for which they are intended—the frank interchange of operating experience.

Training Supervisors Is the First Step

NEED exists for more thorough training of men in supervisory positions. It is well that the electric railway industry is awake to this need, as the rank and file must be reached through these officials. It seems almost trite to say that they occupy a strategic position between men and management, that they are the key men of the industry in employee relations. It's true though trite. A good indication of the interest in the foreman-training movement was the way in which the demonstration conference, staged at Cleveland last October, was received by the large gathering of representative executives. The men who attended had a demonstration which convinced them that the conference plan wins interest and stimulates discussion of the practical, every-day problems of foremanship. There was ample evidence that supervisors can be interested in studying the principles of successful supervision. It was shown that men naturally reticent will discuss vital subjects freely when there are no "higher ups" present.

Having succeeded through several years of effort in awakening an interest in foreman training throughout the industry, the American Association committee on education, under the leadership of its chairman, Edward Dana, general manager Boston Elevated Railway, has undertaken to assist electric railway managers to put on foreman training next season if they so desire. The committee plans to hold during convention week a series of conferences at Cleveland to help train conference leaders. This will in part answer the question: Where can we get men to lead these foremen conferences if we desire to hold them? It will prove an excellent investment for any railway to send a man or two to take this training course, for which there will be no fee to the railway companies. Enrollments are desired promptly, however, as the group must be limited in size, and as correspondence will be conducted during the summer.

Promising as is this plan, a word of warning seems appropriate in connection with the enterprise. Fully equipped foreman-conference leaders cannot be produced in a series of six four-hour conferences. Thus too much must not be expected of the instructors or the participants. A great deal can be accomplished, however, and the program is sufficiently ample to warrant active support of the committee's plan.

Making a Science of Car Replacement

WITH all that has been said on the subject of car replacement and the forceful arguments that have been presented in favor of retiring obsolete rolling stock, skepticism has remained in the minds of some managements as to the financial advantages to be gained by the procedure. Certainly there is no need for scrapping equipment that can give service if it is replaced by other equipment that will not earn more, either in greater revenue, lower expenses or improved good will.

Many of the arguments for new cars have been general, and it has remained for the individual management to reason from these premises to the particular conclusions at hand. This has not always been easy on account of the many variables that enter. H. S. Williams of Detroit has reduced the effect of these variables to a formula which he has presented in an article published in this week's issue. Of course, judgment is necessary in placing the figures into the formula. These figures will vary on different properties, but since nearly all of them are capable of very close estimation, there need be little guesswork in the calculation.

Mr. Williams' formula takes into consideration those factors which are readily capable of accurate determination. There are several other intangible elements, in general favorable to the new cars in comparison with the old, which have not been given consideration. One of these is the reduced accident hazard, due to low floors, better design of entrance and exit and automatic features of door control. Again, in the formula the same cost per ton-mile is assumed for maintenance. It is common knowledge that new equipment costs less to maintain than the car which has been in active service many years.

No allowance has been made in the formula for changes which may be advantageous to the other departments concerned in operation. For instance, the purchase of new cars makes possible more efficient handling of passengers. Again, the comparison is made only between one-man cars or between two-man cars. The purchase of new cars may be made the occasion for changing the method of operation, or the means of selling public and employees the advantages of one-man cars. These are incidental advantages of new cars, but some of them are of major importance, though not easy of calculation.

An analysis of the figures used by Mr. Williams as an illustration in his discussion shows that the most important factors are car weight, seating capacity and schedule speed. Since it is in these factors that the new types of cars excel the old, it is evident that it is not difficult to prove that the usual type of obsolete car is losing money in comparison with the performance of the models which are being offered today.

The Exhibits Are Essentially for Maintenance Men

SOMETHING of interest will be presented for every one at the annual convention of the American Electric Railway Association, but the exhibits are of prime interest to maintenance men. The attendance last year was marked particularly by the large number of foremen who were present. Cleveland, Ohio, the location this year, is the same and, no doubt, the maintenance forces again will be well represented. Each will get value from the exhibits in his own way and in proportion to his capacity to study the material shown. Five minutes devoted to inspection of a particular tool will result in a better understanding of its construction, merits and faults than several hours study of a catalog description.

General managers will do well to send as many men from their maintenance forces to the convention as possible, and the men themselves should study the equipment shown with a view to improving their own methods. Last year one railway sent a large delegation from the maintenance departments, and in addition to attending the convention from opening to finish, the week following was spent in visits to other railway properties that were on the route home. These men obtained much that has since proved of value to their railway.

The Interests of Omaha and Its Railway Are Mutual

OMAHA has finally got around to the point of considering seriously again the question of granting a franchise to the Omaha & Council Bluffs Street Railway. It is not all going to be plain sailing. That is apparent. There will be many chances for honest differences of opinion to arise during the negotiations. One thing is certain. The city will gain nothing if it attempts to hamstring its railway. President Hamilton has already made plain that under the tentative draft presented for discussion it would be impossible to do the refinancing that is imperative. If that be true, then it is enough to temper the attitude of the city officers with reason.

It would be fruitless to carry the negotiations any farther except that such discussions may tend to clarify the issue and verify what Mr. Hamilton says. The city has means at hand to substantiate his statement. The experience of the past is all available to it. The matter has not yet gone far enough for the commentator to offer specific criticism, but one thing does stand out. Danger to cities in the past has not lain in dealing too liberally with their railways, but in being too parsimonious with them. It is always possible to correct the defects of liberality, but the consequences of a niggardly policy are too grave to be eradicated readily. The purpose of the city is to secure adequate transportation. The desire of the company is to give adequate transportation. The issue transcends in importance and in consequence the narrow view that the advantage in negotiations may temporarily be with the city.

President Hamilton has done well to make his position clear at the outset. It is not so much the doing of a thing like this that matters, but rather the manner of the doing of it. It is no fault of the present company that the conditions in Omaha do not begin to approach the ideals which the management has in mind. Those ideals can be realized only as the city is disposed to deal liberally with its street railway, for after all in dealing with the railway it is in the last anlaysis dealing with its citizens. The city and the company will proceed toward a satisfactory conclusion only as they thoroughly understand each other. If the experience of the past really means anything to Omaha, then those responsible for the attitude that the city takes will approach the coming franchise discussion not in a spirit of barter but in one of mutual helpfulness. The reiteration of these things makes them sound trite, but there is no escape from the consequences of their implication. That is proved by history.

Cars Modernized

in Improved Shops

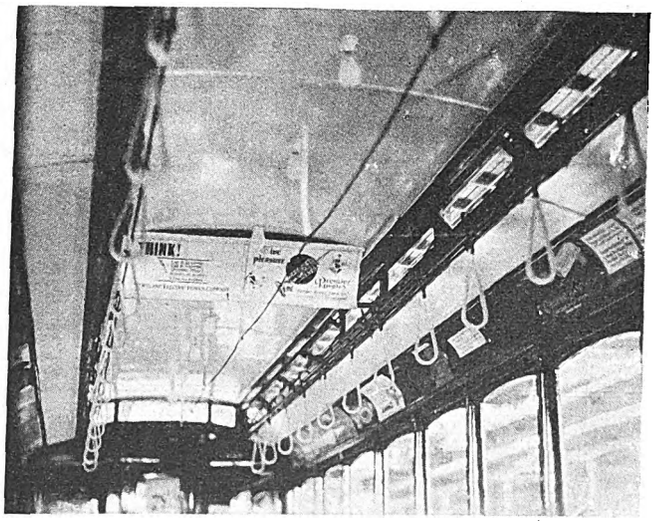
MODERNIZATION of the narrow gage equipment of the Portland Electric Power Company, Portland, Ore., has shown its effect in improvement in appearance of the car interiors and bright-colored, well-kept paint on the exteriors. Most of the cars on this property date back to 1912, but they have been kept in good operating condition by an efficient shop department.

Recent changes made in the cars to render them more attractive include the installation of white celluloid covered hand straps, frosted 60-watt ceiling lamps and white enameled ceilings, both in the upper and lower monitor decks. These improvements have aided in bettering illumination and making the car more cheerful.

A vestibule lamp, controlled by the position of the forward folding door, lights up the entrance and exit steps when the door is open. Many of the cars have been remodeled for one-man operation and in the reconstruction the sliding bulkhead doors were left open and the motorman shielded by a curtain sliding on a horizontal rod. The car exteriors are painted in maroon and cream. Each car is passed through the overhauling shop every eight months, at which time it is given a coat of paint. The under-rigging and operating mechanism are kept in first-class operating condition by frequent inspection. Some experiments are being conducted with cross seats in this type of car, but for the most part the equipment has longitudinal side seats with rattan upholstery.

In the truck repair department air hoists on jib cranes are used extensively for lifting motors from the trucks, lifting out wheels and handling other heavy work. There is plenty of light and ventilation from the monitor type skylights which are constructed over each bay of the building. Accommodations are provided for approximately twenty cars over shallow pits in the repair section of the shop.

The carpenter shop is as light and airy as the other sections of the building. The cars are run in on tracks without pits and the necessary body repair work is done by electrically driven hand tools. One section of the body repair shop is devoted to painting. In this section the buses are painted



Rolling stock has been improved through the installation of frosted lamps, a white enameled ceiling and celluloid handles on hand straps

The timekeeper has a complete record of jobs which are being done in the shop

and other paint work is done on materials for the track, roadway and equipment departments.

Where it becomes necessary to work on the car body when the trucks are removed, the body is supported by electrically operated car hoists, which support the body on I-beams so that work on the bolsters and underframing may be done by men working in the pits.

A small mill is adjacent to the body repair shop. All of the equipment in the mill is individually driven by belting from countershafts installed under the floor. This equipment consists of joiners, planers, band saws, mortisers and other wood-working equipment, with which it is possible to turn out all shapes and members for body replacement work and also to build complete car bodies if necessary.

All armature repair work is done by two winders and as many helpers in the section of the building between the shop offices and the machine shops. Modern stands, dipping vats and bake ovens are part of the equipment of this department. Motor repair work and dismantling of electrical equipment are done in a section of the truck repair department. To keep this section clean, shelves or bins mounted along the wall hold the tools and small parts necessary for the somewhat dirty work of motor repairs. One man and a helper do this phase of overhauling.

Each piece of shop repair work is handled as a job order and is timed by a timekeeper in the shop office. Foremen of the various shop departments report completion of a job to the timekeeper, who then calculates and enters on a card the item of time and costs. The time is computed by a timekeeping machine. Through the use of this method workmen are not idle at any time and the office knows the progress of the work, not only as a whole but for any particular job.

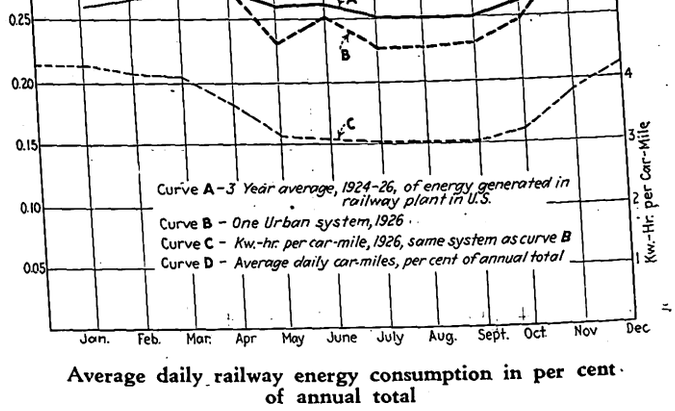
Energy Used for Traction Steadily Increases

Popularity of street car revealed by steady increase in electricity used for traction purposes

ONE of the greatest proofs of the increasing popularity of the street car is revealed by an analysis of the energy consumed for traction purposes during the six-year period 1920 to 1926. In spite of the use of buses, advent of one-man cars, lighter rolling stock, better motors and scientific instruction of operators as to the conservation of energy—all of which at first blush would argue against increased consumption—the analysis conducted by the ELECTRIC RAILWAY JOURNAL, in co-operation with and through the courtesy of G. F. Wittig, statistical editor of *Electrical World*, shows such a steady increase in energy consumed as to warrant, in the opinion of the editors, a résumé of the situation beginning with the year 1920. In order to watch this interesting commentary on car popularity, the chart entitled "Monthly Consumption of Energy for Electric Railway Companies," appearing with this article, will be a regular feature of the JOURNAL in the issue nearest the first of the month.

That the traction companies are calling for more electricity for transportation purposes is revealed in a 25.7 per cent increase in electrical energy consumption for this purpose in the six-year period 1920 to 1926. By far the larger portion of the increase was found by Mr. Wittig to be in the energy purchased from central-station companies, which grew from 4,820,000,000 kw.-hr. in 1920 to 6,599,000,000 kw.-hr. in 1926, or nearly 37 per cent, while the amount generated in the railway company plants increased by only 12 per cent, from 3,903,000,000 to 4,370,000,000.

In determining these figures, data for the years 1920



Average daily railway energy consumption in per cent of annual total

MONTHLY ENERGY CONSUMPTION FOR RAILWAY OPERATION IN THE UNITED STATES

Month	Generated in Company Plants			Purchased			Total		
	1927	1926	Per Cent Increase	1927	1926	Per Cent Increase	1927	1926	Per Cent Increase
January	400	411	—2.7	623	614	+1.1	1023	1025	—0.2
February	350	387	—9.6	558	550	+1.4	908	937	—3.1
March	371	395	—0.5	585	577	+1.4	956	972	—1.6

to 1922 inclusive are taken directly from statistics collected by the United States Geological Survey, while those for the last four years are taken from the same source with a small allowance for the amount of energy estimated to have been used for other than railway purposes. Estimates of the amount of energy purchased annually from central-station companies are those published by ELECTRICAL WORLD, based on returns from about 75 to 84 per cent of the electric light and power industry in various years.

For the year 1922 comparison of the figures here given with those published in the Census of Electric Railways shows some disagreement, especially in the figures for energy generated, where the Geological Survey and Census figures differ very materially.

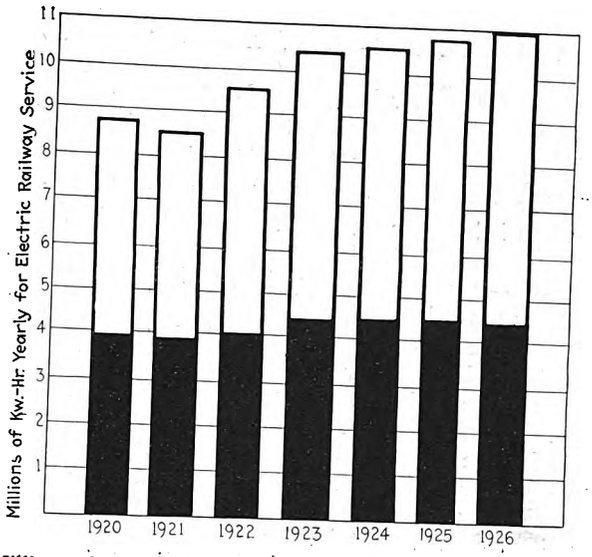
The latter give 6,473,450,701 kw.-hr. generated and 5,931,601,934 kw.-hr. purchased. It is believed that the discrepancy is accounted for, in considerable part at least, by the inclusion by the Census of the output of certain companies serving a considerable railway load, but actually electric light and power companies.

In the chart showing the monthly energy consumption these have been allocated in accordance with ratios worked out from the Geological Survey figures.

The chart of monthly energy consumption shows pronounced seasonal peaks, with apparently erratic monthly fluctuations in addition. The latter entirely disappear, however, when the curve is replotted in terms of average daily energy consumption, expressed as a per cent of the annual total.

In curve A on the chart of average daily consumption each point is the average of the percentages obtained for that month for the years 1924, 1925 and 1926. The curve is based on the Geological Survey figures.

That the seasonal variation observed is due primarily to such influences as car heating and snow removal rather than to any important variation in car mileage is shown by comparison with the curves for a transportation system in a city where climatic influences are pronounced. It appears that while the number of car-miles increased almost steadily from January to December, the energy per car-mile varies along a remarkably smooth seasonal curve.



Millions of kilowatt-hours yearly for electric railway service

The seasonal variation for that system was greater than that for the country as a whole, because the latter is flattened out by the effect of loads in warmer parts of the country where the seasonal influence is less marked or negligible.

Thus far this year energy consumption is slightly below that for the corresponding months in 1926; during January and February the amount of energy generated in the railway company plants was appreciably less than in the preceding year; the purchased energy, on the other hand, shows a slight gain.

No conclusions can be drawn as to the amount of transportation represented by these figures. It may be that the figures have no other significance than that last winter was milder, on the whole, than the preceding one.

In view of the continuance of the same trend through May and June, as indicated by data secured after the chart was drawn, there has presumably been an actual increase in the amount of electric transportation provided. To what extent the increase has taken the form of main-line or suburban operation, by electricity, of railroads as distinguished from street railways, it is impossible to determine from data at present available.

ANNUAL ENERGY CONSUMPTION FOR RAILWAY OPERATION

Year	Millions of Kilowatt-Hours Generated in Railway Company Plants*	Purchased from Central-Station Companies†	Total
1920	3,903	4,820	8,723
1921	3,883	4,600	8,483
1922	3,946	5,642	9,588

When Is a Car Not a Car?

By H. S. Williams
Assistant Superintendent of Equipment Department of Street Railways, Detroit, Mich.

THE answer to this question is that a car is not a car when it becomes a carcass. In other words, when it is a thing devoid of sales value or appeal to the traveling public—a cavernous body into which funds are unavailingly poured.

As the result of an effort to devise some definite method of calculation by which it can be determined just when a car should be relegated to the junk heap, a simple formula has been evolved in which a figure is set up for the old car and another for the proposed new car with which it is to be replaced. When these figures are equal, or specially when the figure representing the old car exceeds that for the new car, then the retirement of the old car is not only justified but demanded. Expressed another way, when the value y in the formula equals or exceeds the value x, then the scrapping of the old car is advisable. This computation is based upon the cars rendering equivalent service.

$$x = [\,(a - k) \times (\frac{i}{2} + j)\,] - h$$

$$x = \$946.00 \quad \text{and} \quad y = \$2{,}638.35$$

x = Annual cost of the proposed new car.
y = Annual cost of the old car.

a = Estimated cost of new car.
b = Maintenance cost per year of new car.
c = Maintenance cost per year of old car.
d = Operating cost per year of new car.
e = Operating cost per year of old car.
f = Seating capacity of new car.
g = Seating capacity of old car.
h = Added annual value of new car.
i = Interest rate on new capital.
j = Amortization rate on new car.
k = Scrap value of old car.

The first element of the formula $(a - k)$ is self-evident, as it represents the net cost of the replacement unit. The next is $i/2$, which is the average interest rate on the capital investment over a period of years, for it is evident that if the principal is reduced each year the interest is automatically reduced also. The item "j" is the amortization rate or the percentage of the principal that is paid annually. Thus if the car has an estimated life of twenty years it would be amortized at the rate of 5 per cent per annum. The factor "h" is an estimated amount expressing the worth of the new car in attracting added patronage each year. In figuring the net cost of the new car this amount should be deducted. Ordinarily this amount will not be large enough to affect greatly the net result.

There is little explanation required for the balance of the equation. The factor $(c - b)$ is the difference in the cost of maintenance between the old and new cars as represented by accounts 30, 33, 36 and 37. Similarly the element $(e - d)$ is the difference in operating costs. This would naturally include only those items which vary and so no general rule can be established that would cover every property. If the proposed car were of the one-man type or of different speed, then platform expense would enter. Likewise, if proposed changed equipment required more or less inspection, this would become a factor. Undoubtedly at the present time a proposed car would involve a change of weight which would affect the cost of power for propulsion as well as wear and tear on track. The ratio f/g is introduced to evaluate the difference in seating capacity, if any, and so place the two cars on a strictly comparable basis. The same value could be obtained by changing the car mileage of the new unit to compensate for difference in seating capacity.

Perhaps it might be well, for the sake of clarity, to carry this one step farther and work out a case using actual values, as follows:

	Old Car	Proposed New Car
Cost	.....	$14,000.00
Weight, pounds	42,000	34,000
Seating capacity	40	52
Car-miles per year	36,000	33,000
Ton-miles per year	756,000	561,000
Interest rate on new capital, per cent	.....	6
Estimated life of car, years	.....	20
Amortization rate, per cent	.....	5
Maintenance of equipment per car-mile	$0.026	$0.016
Car maintenance cost per year	936.00	528.00
Energy for propulsion per ton-mile	0.0024	0.0024
Energy cost per year	1,814.40	1,346.40
Track maintenance cost per ton-mile	0.0017	0.0017
Track maintenance cost per year	1,285.20	953.70
Platform expense per car-mile	0.147	0.147
Platform expense per year	5,292.00	4,851.00
Carhouse employees and expense per car-mile	0.0027	0.0027
Car-house employees and expense per year	97.20	89.10
Scrap value of old car	300.00	.....
Added annual value of new car	.....	150.00
Schedule speed, per cent	100	110

It is to be noted in the above that the portion of the operating accounts affected are the only ones figured. For example, under car maintenance account 29 is not taken into consideration, as it will remain the same whether the company operates old or new cars.

Substitute the above values and working out the two equations we find that:

$$x = \$946.00 \quad \text{and} \quad y = \$2{,}638.35$$

Thus it is established that it would be profitable to purchase new equipment.

Attention is called to the figure assumed for the added annual value of new car, which is extremely low, being of the order of 50 cents a day. Estimates from properties using modern equipment show increased riding values of around 4 per cent (see Electric Railway Journal, Vol. 69, page 295), although much higher values have been reported from time to time. On such basis the increased value of this car would be $619 instead of the $150 shown. There is an intangible value in good will which new equipment gives, but no attempt has been made to evaluate this. If the new equipment be capable of greater speed and acceleration than the old, this value would be reflected in the various items of the equations in which car mileage is a factor, as equal service would be rendered with less mileage. Thus in the above estimate the proposed car is capable of 10 per cent higher schedule speed and the annual mileage is reduced by this amount to give equivalent service. Also the platform expense is reduced by a like percentage and car cleaning and inspection follows suit.

An analysis of these figures shows that the most important factors are car weight, seating capacity and schedule speed. It goes without saying that these items should be given prime consideration in the discussion of new cars. It is thought, however, that expressing the various factors in algebraic form, as shown herewith, gives a clearer conception of their relative importance and will be of assistance in proving the economic value of new cars.

Birdseye view of Acton overhaul shops, London Underground Electric Railway. These shops are being altered so as to adapt them to the method of overhaul by conveyor platform

Overhaul by Conveyor Platform

By Henry W. Blake
Senior Editor *Electric Railway Journal*

European electric railways adopt Henry Ford's construction methods in the overhaul of their equipment. Entire shop based on this principle designed by the London Underground Electric Railway

WHILE the principle of the slowly moving conveyor for assembling equipment is identified in the popular mind with the Ford motor plant in Detroit, it has been adopted by other manufacturers under circumstances where its use seems suitable. Its advantages, of course, are that workmen, individually or in gangs, can work on one kind of job continually and so become expert at it, and also that there is a definite limit to the time that they can take for each process. These conditions promote quality and rapidity of output.

It is interesting that several European electric railways have adopted the same principle in the overhaul of their equipment. The largest undertaking of this kind on the Continent of Europe is undoubtedly that of the Berlin Surface Lines, where the present overhaul schedule requires twenty cars to be put through the shop each week. The conveyor table for motor assembly at the main shops of the company is shown in the illustration on page 304.

The conveyor is made up of wooden plates bolted to steel links. It has a length of about 20 m. (65 ft. 8 in.) and a width of 1.5 m. (5 ft.) with a carrying capacity of about 1,000 kg. (2,200 lb.). It moves at a speed of 2 m. (6 ft. 7 in.) an hour. Six distinct processes are performed on the conveyor in the assembly of a motor, as follows:

The conveyor starts with an empty motor shell, and the first workmen slips in the field coils.

In the second process the distance between the poles is measured and corrected, if necessary.

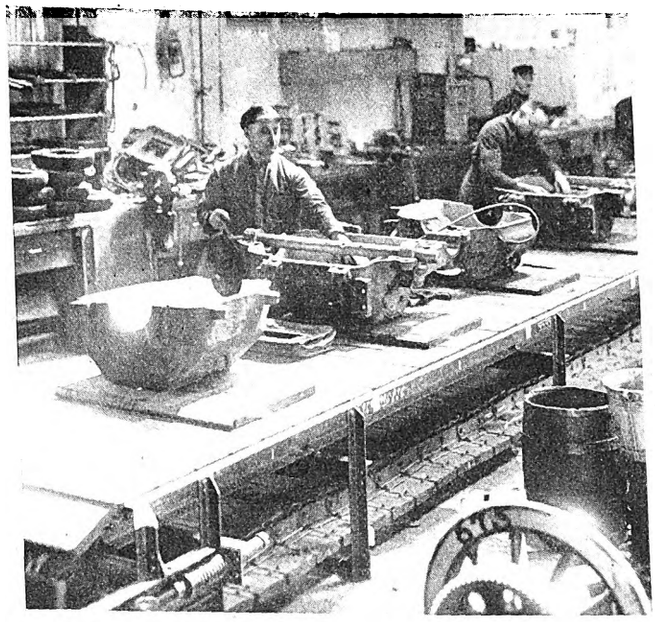
The third process consists of connecting the field cables.

In the fourth process the armature, brush-holder and bearings are inserted in the shell.

The fifth process consists of closing the motor up and the sixth process is the electrical test.

At present it is possible to put ten motors through these processes in a day of eight hours, which is all the time that is needed with the existing schedule. The conveyor has been in use since about April of this year,

Digitized by Google



Workmen in the overhaul shops of the Berlin Surface Lines assemble motors on this conveyor platform

and it is expected that the work can be speeded up if necessary, as the men become more accustomed to the plan.

While the motor equipment is going through the shop and then being assembled the car bodies are passing through a somewhat similar process, though not on a conveyor platform.

First the bodies are raised by jacks and mounted on dummy trucks, when the regular trucks and motor equipment are taken to the motor shops. Where the motor equipment is attached to the car body and no trucks are used, as in the last 1,000 cars purchased, the axles with their motor equipment for the one car are kept together in their normal position by a wooden spacing piece, as shown by an illustration on page 302. They are taken in this position to the shops.

In the second process to the car bodies the framing and paneling are fully gone over and rotten or dented parts are removed. Although the more recent Berlin cars are steel, the company still has a good many wooden cars. Incidentally, it might be said that in the car framing the corner posts are at the ends of the bulkheads and not on the platforms, because of the great number of vestibule injuries suffered through street collisions. The company therefore keeps in stock standard vestibuled platforms for attachment to car ends.

In the third process new wood or metal parts are inserted and all joints and metal braces are painted or otherwise protected from dampness.

In the fourth process the side panels are attached, any other body work required is done and the inside electrical equipment is completed. Incidentally, it might be said that the motor resistances are carried on the roof, and instead of being of cast iron are of a special wire called resistine, made by the A.E.G.

WHAT DO OPERATING STATISTICS TEACH US ?

	1921	1922	1923	1924	1925	1926 / Quarter Year	Methods of Keeping Down
Grease Consumption every 100,000 car Km.	279.4 Kg.	181.8 Kg.	150.5 Kg.	97.5 Kg.	75.0 Kg.	65.47 Kg.	Suitable material. Better lubrication inspection. Education of the force. Systematic inspection. Uniformity of lubricant.
Armature Failures every 100,000 calculated Km.	0.37	0.49	0.25	0.07	0.01	0.003	Better bearing support of the armature in its housing. Organized inspection. Education of the force. Better attention to renewal of bearings. Introduction of roller bearings.
Field Coil Failures every 100,000 calculated Km.	1.75	1.86	0.61	0.45	0.9	1.16 Increases are caused by replacements before actual failure has occured, as found desirable by closer inspection	Better inspection through test. Education of the force. Reduction in number of motor types.
Brake Shoe Consumption every 100,000 car Km.	69.6	65.4	59.5	33.6	20.0	18.2	Suitable material. Better brake rigging. Better maintenance. Substitution of electric for air brakes

Transfer table, or traverser, used in the Acton overhaul shops of the London Underground Electric Railway. Note the neat appearance of the pit. This is characteristic of the surroundings of the shops and depots of this company Many of them have flower beds

The fifth process on the car bodies is to drop them back upon their running gear or trucks and put on the inside fittings.

It is appropriate here to say that on all cars purchased since 1924, 1,300 in number, the car journals are fitted with S.K.F. roller bearings. The journal box has a boss or flat space at the bottom under which a jack can be inserted when the car body has to be raised. These roller bearings operate in grease and will run two years, or 120,000 km. (75,000 miles), without further lubrication. The equipment engineers of the company declare that roller bearings are the greatest improvement in rolling stock made in recent years and consider their use is essential for success with the Cardan drive type of motor propulsion.

These roller bearings are cleaned once a year. At these times they are removed from their housings and dropped into a tank filled with cleansing fluid. At the bottom of this tank a group of magnets draws out any steel particles which may have got into the bearings. Roller bearings are also used for the armatures of all new motors. To prevent the return current passing from the motor frame to the wheels through the roller bearings, and hence possibly pitting them, each axle of every motor car with roller bearings is fitted with a collector ring with carbon contacts which are electrically connected to the motor frame.

In recent inside car fittings for such parts as grab handles, stanchions, etc., chromium plating is used instead of nickel. It is harder than nickel and does not tarnish. The chromium is put on the steel or brass in an ordinary plating bath and the finished plated object looks just as if it had been plated with nickel. Of course, this process is used to a considerable extent in America by automobile manufacturers both to give a hard wearing surface, as on piston pins, and for its finish and tarnish resisting qualities, as on radiators. In Germany the electric railway companies are also employing it quite generally for the parts mentioned, and several have their own plant equipments.

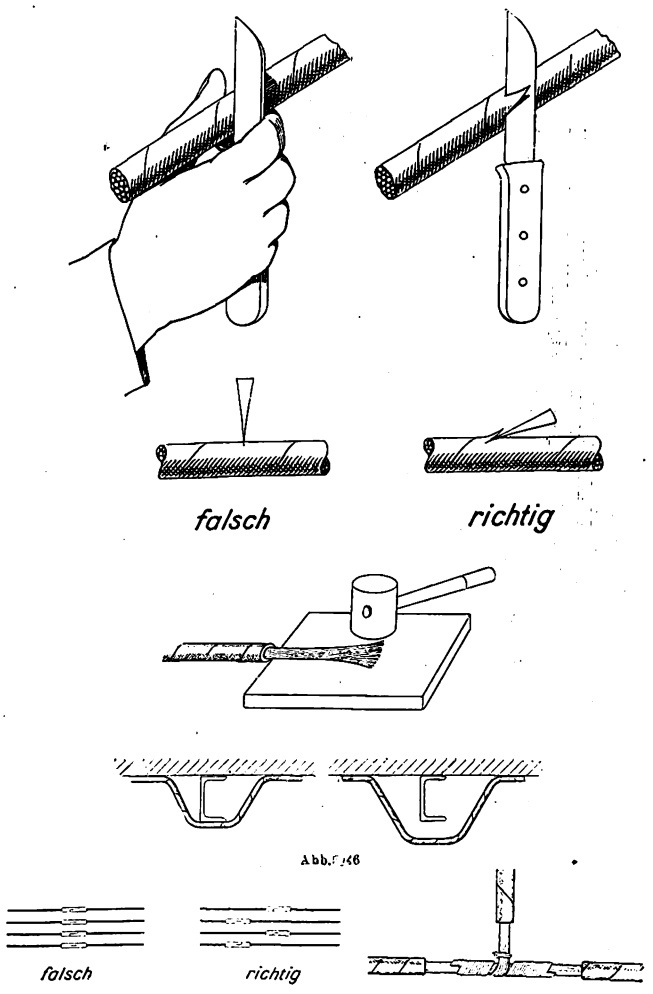
A feature of overhauling in Berlin is that every car after passing through the shop is marked with the date of its departure and the extent of the overhauling given. A typical marking, which is in small letters on the outside of the car on the lower panel, reads as follows:

Strb. Unt. H. W. Lack, N.A.G.R. 30, 1 V, 27, 0.Dy. 4.92 a.

This lettering indicates the extent of the repairs made at the main shop, their date and the type of the motor.

To encourage careful maintenance and daily inspection in the carhouses, charts are posted there from time to time to indicate the savings made in recent years. A typical chart of this kind is published. A handy guide on car equipment inspection, written by the chief engineer of the company, E. Kindler, is also put in the hands of every man engaged in this work. A typical page is reproduced.

This article began with a reference to the adoption of the conveyor system by the London Underground



An aid to better maintenance in Berlin is a hand book of instructions, prepared by the engineering and maintenance department. This page reproduced from the book shows the false and correct methods of stripping insulation and making loops and connections.

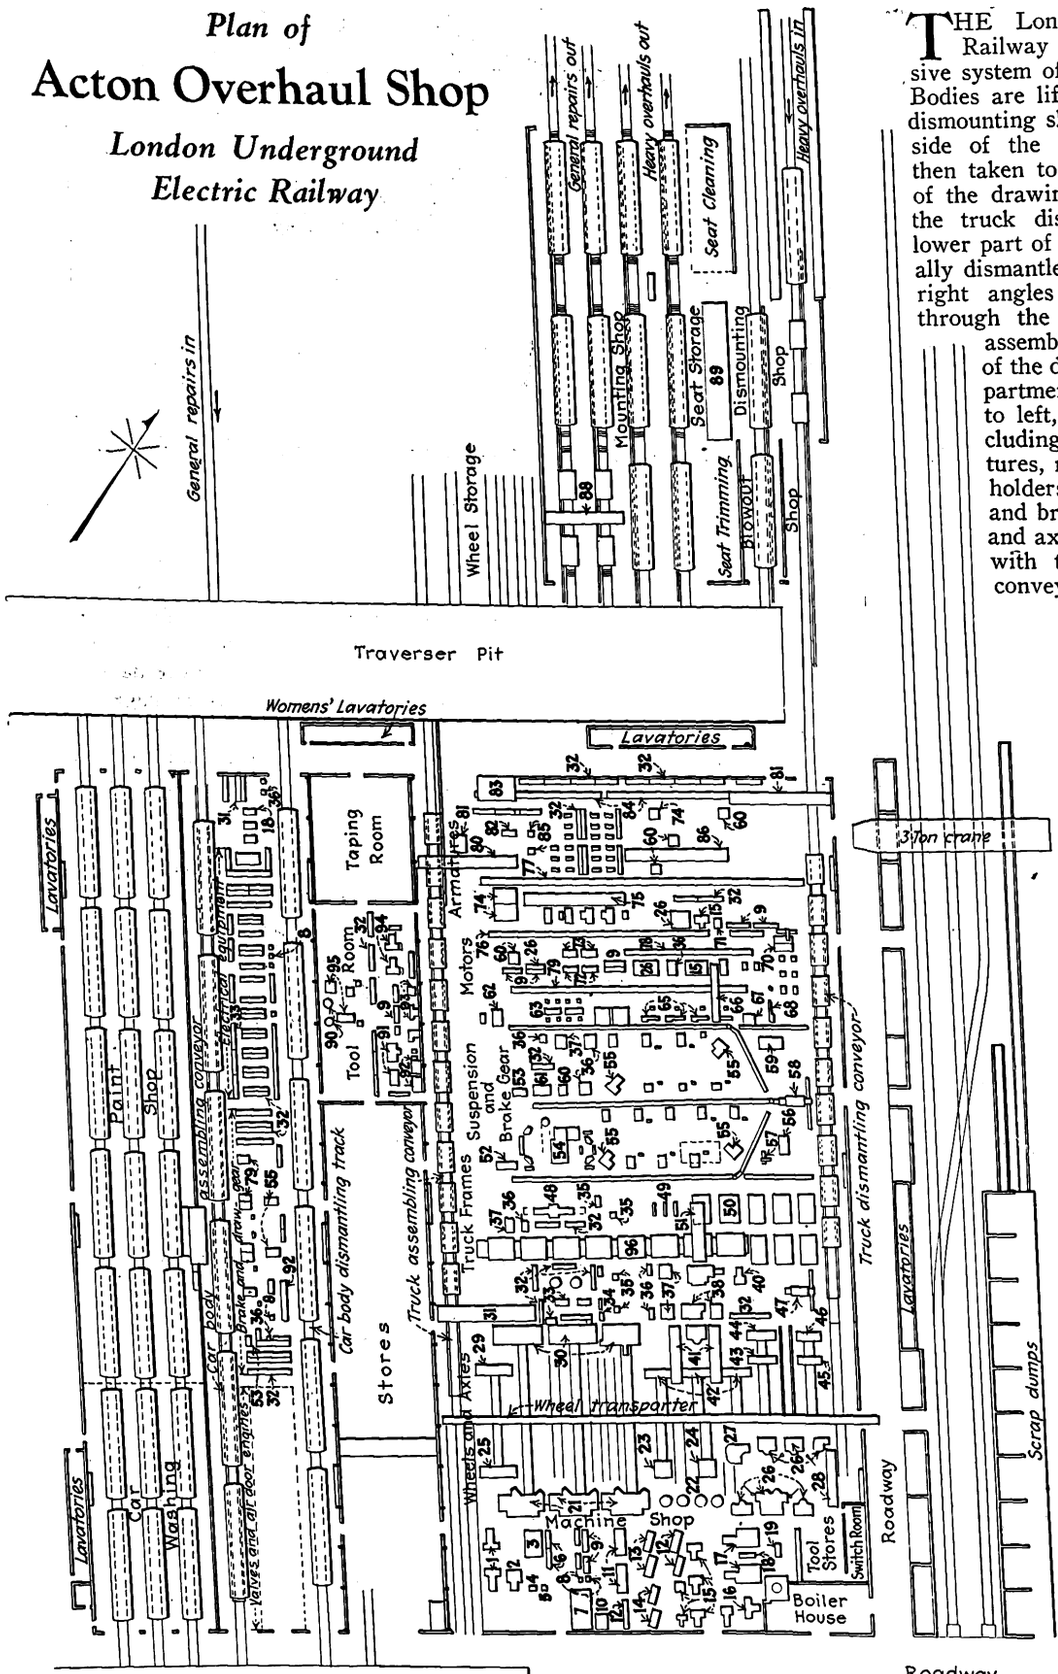
Plan of Acton Overhaul Shop

London Underground Electric Railway



THE London Underground Electric Railway has adopted the progressive system of repairs for its Acton shops. Bodies are lifted from their trucks in the dismounting shop (in the lower right hand side of the drawing). The bodies are then taken to the shop (in the upper part of the drawing). The trucks proceed on the truck dismantling conveyor (in the lower part of the drawing), and are gradually dismantled, the parts being shunted at right angles (upward in the drawing) through the different bays to the truck assemblying conveyor (in the middle of the drawing). The truck repair departments in their order, from right to left, are shoe beams, motors (including separate conveyors for armatures, motor case covers, etc., brushholders and motor cases), suspension and brake gear, truck frames, wheels and axles. The trucks are assembled with their equipment on the main conveyor, in the middle of the shop.

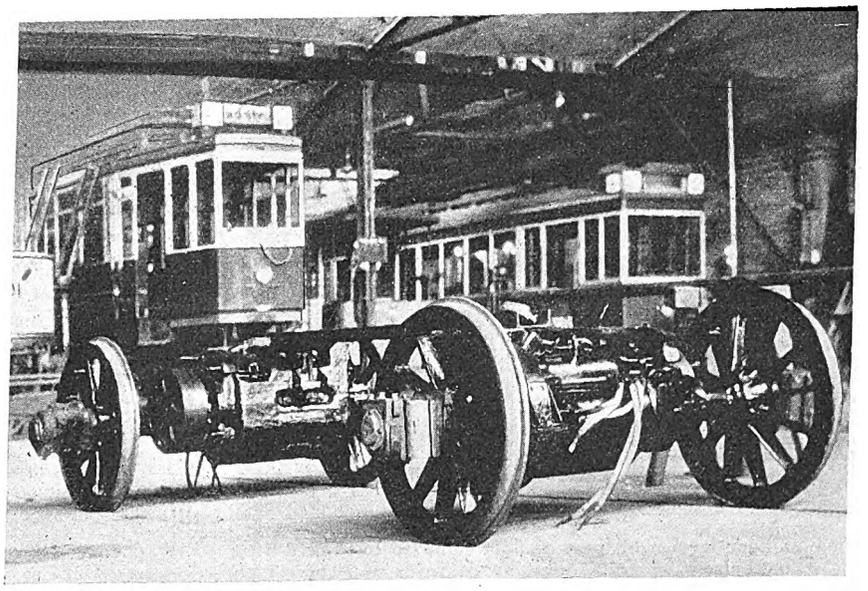
Electric Railway System. This installation is being put in the Acton shops, and it is expected that it will double the output of cars within a specified time. The same principle has been applied for bus overhaul in the shops of the London General Omnibus Company, which is controlled by the same interests. So far as is known this is the largest application to electric railway shops.

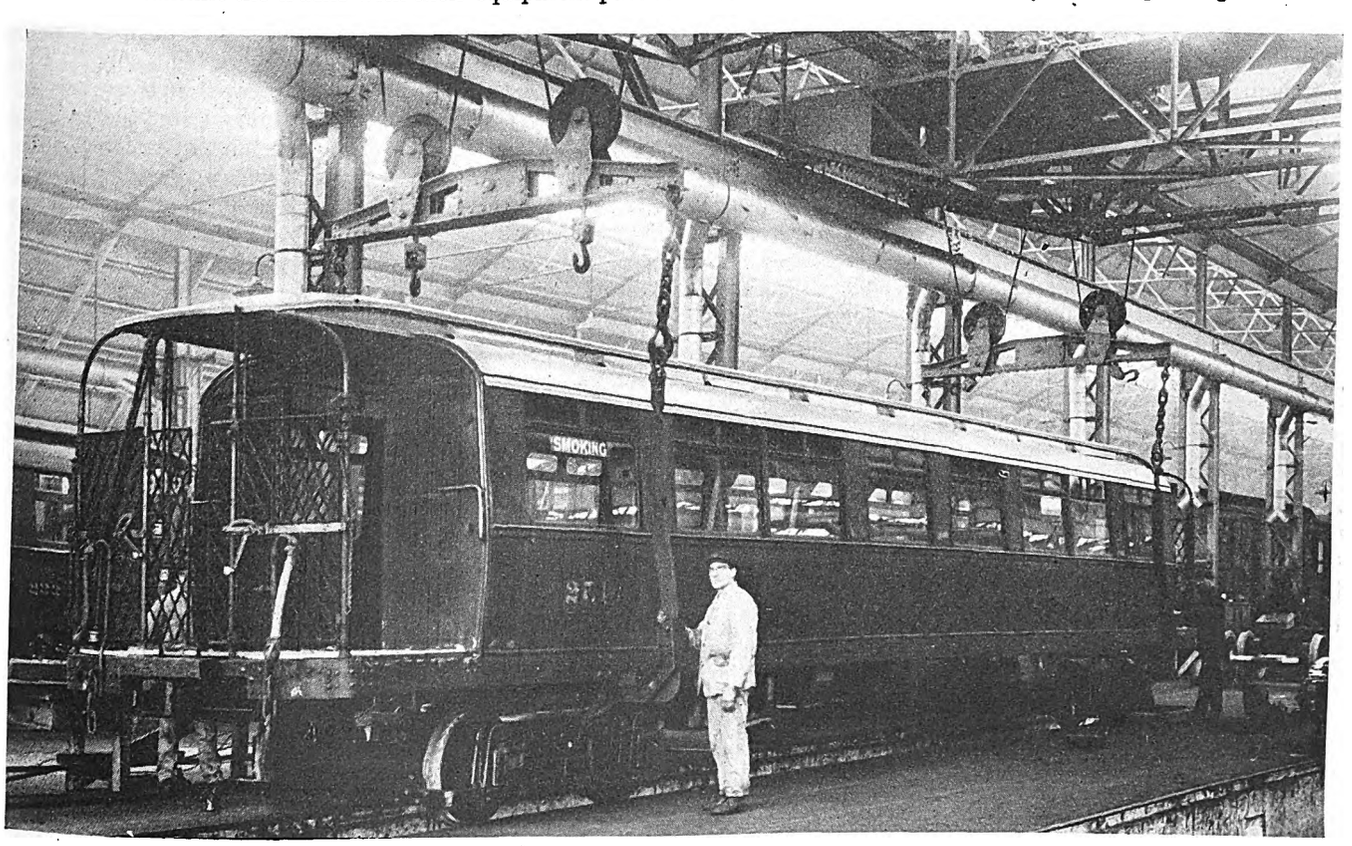
The cars for heavy overhaul enter the shops at the northeast end, shown in the lower right-hand corner of the drawing on page 306. Here the car body is lifted by the crane illustrated below. The crane is equipped with two motors connected by a shaft so that they operate at the same speed; hence, the car body will not tilt. This crane places the car body on dummy trucks which raise it about 4 ft. above its normal position. Then if it requires heavy body work it is taken to the wood shop on dummy trucks, and if it should need painting only, to the paint shop. Movements in this dismounting shop are made by a haulage chain, to which is attached a so-called "carrier," which can be clasped to the chain by a link or bar. This chain runs at a rate of about 30 ft. per minute and is about 15 in. outside of one of the rails. When the car has reached the point desired a single movement of the bar releases the car from the chain. Movement between buildings is by transfer table or traverser.



A wooden spacing bar holds the motors and wheels of the truckless car in their proper position while being taken for overhaul to the motor department in the Berlin repair shops

In the meantime the trucks with their equipment pass to the machine shop through which they move by conveyor. The speed of this conveyor is 6.7 in. per minute, so that about 6¾ hours is required by it to travel from one end of the shop to the other. As the truck and equipment are carried along on this conveyor the various parts are taken out to be shunted at right angles for repair, so that the last part is taken off the main conveyor before the end of the shop is reached.

The first of these bays at right angles to the main conveyor is devoted to motor repairs, because in some cases these may be the only repairs required to the equipment. Here there are conveyors at right angles to the



After entering the overhaul shop, the car body is lifted from the trucks by this special crane. The trucks then go to the truck shop and the body to the body shop

View at floor level, with part of floor removed to show driving mechanism, of truck assembly conveyor at Acton

main conveyor for dismantling and reassembling the motor parts. The motors in this department are put through in batches because the company has several types of motors. In a similar way there are other conveyors or rollerways for the suspension and brake gears, truck frames, wheels and axles. Each of these bays is equipped with machinery for the work to be done there.

As the parts emerge from their various bays they pass onto the truck assembly conveyor, which moves in the opposite direction from the dismantling conveyor; i.e., from left to right as one looks at the drawing. On this conveyor the truck is put together part by part, and toward its outer end (to the right in the drawing) the flooring on each side of the conveyor is broken away so that men can work underneath. This conveyor operates at the same speed as the incoming conveyor, or 6.7 in. per minute.

Both conveyors are made of wooden planking resting on chain links on which are mounted 5-in. diameter rollers. The conveyor operates over large sheaves at each end. As it returns upside down, the wheels are uppermost, but the chains slide along a greasy track, so that there is little friction.

If complete overhauling is not required but certain parts require attention, as when a car needs simply new motors or wheels, it is put on a special track and its defective part taken out and a new one substituted.

The car body shop operates also upon the progressive system, but the cars are moved when required by a chain instead of continuously by a conveyor. This chain, which is fitted with carrier and link like that in the dismounting shop, is located about the same distance from the rail as in that shop and operates at a speed of about 10 ft. per minute. The cars come in here on dummy trucks and after reaching their desired position are disconnected from the chain. The equipment on the car body, such as compressors, switches, brake rigging, etc., is then progressively removed and the necessary repairs are made. The car bodies are then taken to the paint shop, where there is also a progressive movement. The time for painting is three days. Certain tracks in the shop are for complete jobs and others for retouching.

The shops are not yet in full operation by this system, but the main conveyors are in, and it is expected that the entire change-over can be effected by the end of this year.

Operator Establishes Loan Fund

THROUGH R. G. Carroll, manager of the Galveston Electric Company, Galveston, Tex., it was recently announced that Stone & Webster would establish a $10,000 student loan fund for the benefit of engineering students at the Texas College of Agriculture and Mechanics. Plans and details for the loan were worked out by Messrs. Carroll, Burke and Clifford and Dean F. C. Bolton.

Loading Platforms Reduce Accidents at Allentown

BECAUSE much through automobile traffic uses the streets where the tracks of the Lehigh Valley Transit Company are located in Allentown, Pa., ten loading platforms have been built to aid passengers boarding and alighting from cars. At first they were built only 50 ft. long, because the city authorities feared that a greater length would cause traffic congestion. Later the length was increased to 100 ft. They are built of concrete and are 12 in. high. A strip of steel protects the edge of the concrete. The outer side is painted in black and white squares to increase the visibility of the platform. At the end of the platform is a concrete bumper surmounted by an electric light. According to the police department, street accidents have been reduced 80 per cent since the installation of these platforms.

Concrete loading platform at Allentown is 12 in. high and 100 ft. long

Most breakage occurs at edge of commutator slots and is greatest on small motors. The direct cause of breakage is vibration, which causes oft-repeated movement. Remedy lies in better support for leads and freedom from abrupt bends

Methods Used to Prevent Breakage of Armature Leads

By F. W. McCloskey
Motor Engineering Department, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

BREAKAGE of leads which connect the armature winding to the commutator has always been a troublesome problem in direct-current railway motors. Few, if any, of the smaller and medium-sized motors have been entirely immune from this trouble. Epidemics of broken leads have occurred under more or less mysterious circumstances difficult to explain, considering that often on other properties the same type of motors operated almost without lead breakage under similar conditions. The study of this question has therefore been one of importance and interest both to operators and manufacturers.

The breakage is usually at the edge of the slot where the leads enter the commutator. In certain designs the breakage occurs a short distance behind the commutator, where the leads make an abrupt bend. Occasionally breakage of leads occurs under the front steel band which is wound over the coil ends and leads, or still more rarely near the core where the lead leaves the coil.

Broken leads in the larger strap wound armatures are rare, and the cause in this instance does not appear to be the same as for the smaller wire. The motors most inclined to this kind of trouble are those rating from 25 hp. to 125 hp. In armatures up to about 60 hp. some 80 per cent of the failures occur in the top leads. In motors above this size the bottom leads give a greater proportion of the trouble, but in these sizes too breaks of the top leads predominate.

The direct cause of the breaking of armature leads is due, in general, to a slight movement frequently repeated, with resultant localization of stress at the bends in the lead, most particularly at the point of attachment to the commutator. A large contributing cause is that the elastic limit, ultimate strength and endurance of copper are low when subjected to repeated bending. It is probable that if an armature were kept in service long enough all the leads would break off at the commutator if any movement whatever is permitted. In this respect copper is quite unlike steel, which up to the endurance limit can be subjected to repeated stress indefinitely. Up to comparatively recent years a quite common cause of this movement of the leads was that the commutator or core was loose on its seat. Improvements in design and manufacture of modern types of railway motors have eliminated these particular causes.

The modern motor is, nevertheless, subjected to many sources of vibration, such as gear vibration, track conditions, magnetic reaction, etc., which are the principal factors in broken leads. Little is at present known about the calculation of stresses in the leads. Until more theoretical studies have been made, which may throw light on the subject, it is necessary for the motor designer to minimize the effect of these stresses and prevent their concentration at any particular points. A means has been found which has been successful to a very large degree, and in arriving at this solution the designer pursues the following line of reasoning:

Bending Stresses Distributed Over Maximum Length

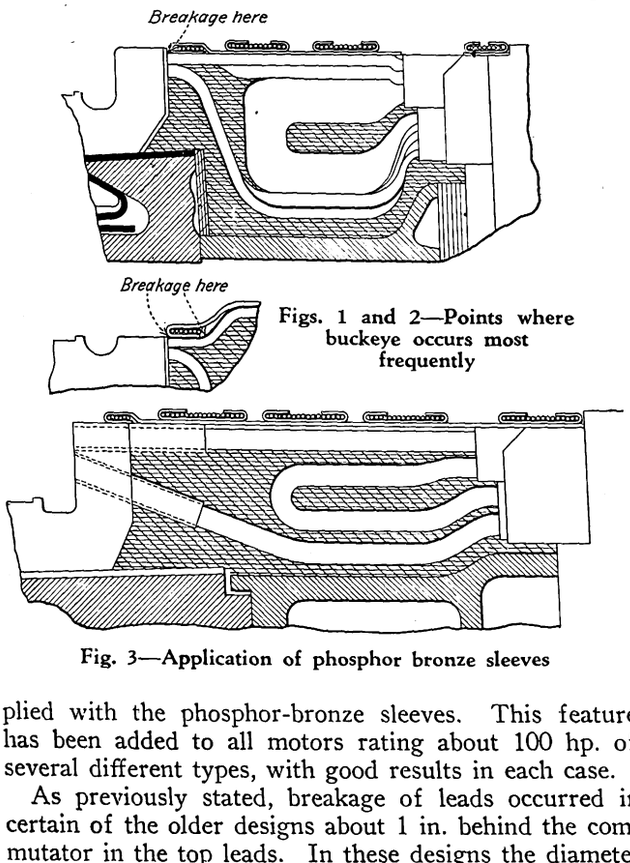
If a single piece of round or rectangular wire is gripped in a vise, leaving say 5 in. extending beyond the jaws of the vise, and if the wire is bent back and forth a few times it will break at the point where the wire leaves the grip of the vise. If a similar piece of wire is reinforced at the portion gripped in the vise and to a point say $\frac{1}{4}$ in. beyond the edges of the jaws by means of copper sheet wrapped and soldered about the wire, we shall find that several times as many bends back and forth are required before the wire will break. This is for two reasons: First, the section at the former breaking point is stronger due to the added strength of the wrapper; second, because the action of bending is distributed so that it is not concentrated so much at the edge of the jaws as formerly. This results from the more gradual stepping down from the very rigid condition of the wire within the jaws, through a less rigid condition in the section $\frac{1}{4}$ in. long, to a still less rigid condition in the bare wire itself. This gives the effect of fillets as applied in a shaft where the sections vary abruptly in diameter. The fillets increase the actual strength of the shaft considerably, by distributing the bending stresses.

Phosphor bronze sleeves were first applied to armature leads in motors rating around 100 hp. and having a two-turn ribbon coil as illustrated in Fig. 3. A sleeve made from sheet phosphor bronze $\frac{1}{64}$ in. thick was slipped over the end of the wire, the proportions being such that a fairly snug fit on the wire was obtained. To assure an intimate soldered contact between the sleeve

Digitized by Google

and the lead, the phosphor bronze sleeve was made from a sheet that had been tinned. The leads with the sleeve in place in the commutator slot during the soldering of the commutator become thoroughly soldered. The strength of phosphor bronze being four to five times that of copper, it is evident that the sleeve adds considerable strength to the plain copper wire. Also, the effect of a fillet is gained by stepping down more gradually from the rigid commutator to the relatively flexible lead.

This construction was put into regular production about twelve years ago on a type of motor which had previously been subject to lead breakage when not supplied with the phosphor-bronze sleeves. This feature has been added to all motors rating about 100 hp. of several different types, with good results in each case.



Figs. 1 and 2—Points where buckeye occurs most frequently

Fig. 3—Application of phosphor bronze sleeves

As previously stated, breakage of leads occurred in certain of the older designs about 1 in. behind the commutator in the top leads. In these designs the diameter of the commutator was considerably less than that of the front end of the winding, which necessitated a rather abrupt bend in the lead downward toward the commutator neck. This condition is shown in Fig. 2, and resulted in concentration of stress and more or less breakage at this location. The extent of this breakage was never as great as at the point of attachment to the commutator, but was, nevertheless, quite serious. The diameter of the commutator neck was therefore increased so that the top leads could be brought out without any appreciable drop. This accomplished the double purpose of facilitating the application of the phosphor bronze sleeves and eliminating the breakage which occurred formerly at the drop of the lead.

In the small motors, 25 to 60 hp., the sleeves have not been adopted, owing to the difficulty of applying them to the more flexible small leads. Therefore, a substitute remedy was sought which might be applied more readily. The remedy has been found in a special cement treatment of the leads, applied immediately behind the commutator neck. The process for application is as follows:

After the insulating foundation for the top leads has been completed in the usual manner, the loose sleeving on the top leads is removed to a point about $\frac{1}{4}$ in. beyond the end of the double cotton covering on the leads. Each lead is then taped with a good grade of friction tape from a point about $\frac{1}{2}$ in. behind the commutator neck to a little beyond the point to which the loose sleeving has been cut back. The leads are then laid down in one or two layers, depending upon the amount of room that is available for the leads. This varies with different designs. If two layers are required, every other lead is bent back out of the way and the remaining leads are laid down in one layer, shaping them so as to obtain compactness; that is, each lead lying snug against its neighbor. This matter of compactness is especially important in the region from 1 in. to 2 in. behind the commutator. Suitable insulation in the form of cotton webbing, untreated, is wound next over the first layer of top leads, and the second layer of top leads is then laid down. After the leads are soldered to the commutator, the armature is heated in an oven until its temperature is about 70 deg. C. and the winding is completed, with the armature hot, as follows:

1. Temporary bands are wound on the core and the rear coil ends.

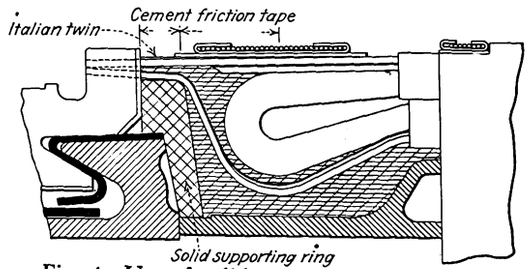


Fig. 4—Use of solid supporting ring between coil support and leads

2. The leads and end winding at the front end are drawn down by means of a $\frac{3}{8}$-in. soft rope as the armature is turned slowly in the banding lathe. To aid this operation it is sometimes necessary to tap down the leads lightly with a mallet as the rope is being wound on. The rope is then removed.

3. A special cement is applied just behind the commutator neck in the spaces between the leads, which are bare for a distance of about $\frac{1}{2}$ in. (Fig. 4.) The consistency of the cement should be about that of thin putty. The cement is worked between the leads and spread over them for a distance of about $1\frac{1}{4}$ in. behind the commutator neck. For this purpose a narrow putty knife serves very nicely. When applying the cement the armature need not be more than comfortably warm.

4. Twine is wound on in a single layer, starting at the commutator neck and ending about $1\frac{1}{4}$ in. behind the commutator. This serves to seal at the commutator neck and at the same time presses the cement firmly between the leads and retains it there during subsequent baking.

5. The armature is again heated to about 70 deg. C. and then dipped and baked.

6. Temporary bands are removed after the armature is cold and the permanent bands are applied.

7. The commutator is finished in the usual manner.

This method of attacking the broken lead problem has been tried out on a number of properties and in each case marked benefits have been obtained. Many of the armatures thus treated have been in service two or three years and the life thus far obtained is from two to five times that obtained with the same armatures treated in the ordinary manner. No failures have recurred in any of these armatures.

An important point in this treatment is to use a cement that will remain slightly flexible after baking and which

Digitized by Google

will not crumble or crack under vibration conditions. The above cement treatment has passed the experimental stage and has been adopted as standard on all 25 and 35 hp. railway motors.

One of the conditions in an armature winding which encourages breakage of leads is the relatively large amount of insulating material in the form of tape, which ordinarily is used as a filler between the ends of the coils and the commutator. This material dries out, which in time produces a drum-like condition in the lead structure, thus promoting vibration and movement of the leads. To improve this condition a solid ring of insulating material, pressed or turned from a solid block, is used as a filler between the coil support and the leads (Fig. 4). This ring also provides a much more solid support for the leads than can be obtained with the tapings usually employed.

The ring is assembled on the front coil support prior to the pressing on of the commutator. The fit between this ring and the coil support is made quite snug so that after the armature is dipped or baked a very solid and substantial job is obtained. This construction is being applied to the smaller motors.

A construction similar to this was first tried out by the Milwaukee Electric Railway & Light Company. In this instance a similar ring was used, except that it was split. This construction has given good results and has the advantage of being readily applied in case of renewals. For new motors the solid ring is preferred as it gives a more substantial support.

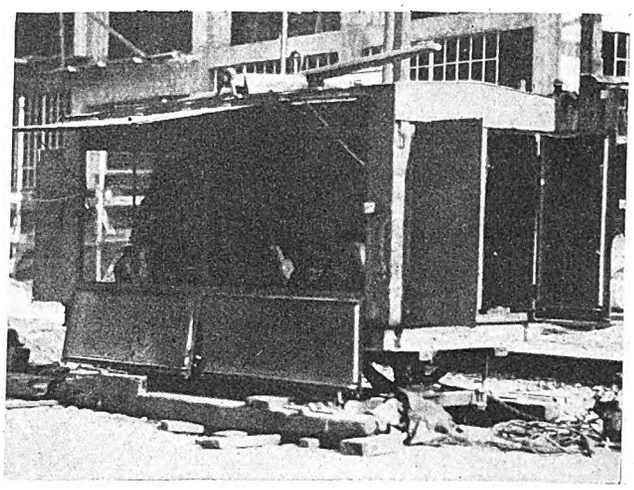
In conclusion it may be said that with the phosphor bronze sleeves as applied to the larger motors around 100 hp., and the cement treatment with solid ring construction as applied in the smaller sizes, a very substantial gain has been made in the direction of reduced maintenance and greater reliability in service.

Speedy and Economical Track Raising

BECAUSE of the ever-changing condition of the subsoil in certain sections of San Francisco it is necessary for the Market Street Railway, from time to time, to raise its tracks to a new established grade line conforming with that of the street as established by the City Engineer's office. Each year this forms a considerable part of the program of track maintenance and rebuilding of this company. That it will confront this property for some years to come is evidenced by the fact that portions of Market Street, the main thoroughfare of the city, have been raised in the last twenty years as much as 13 ft. Other streets have been raised even a greater amount.

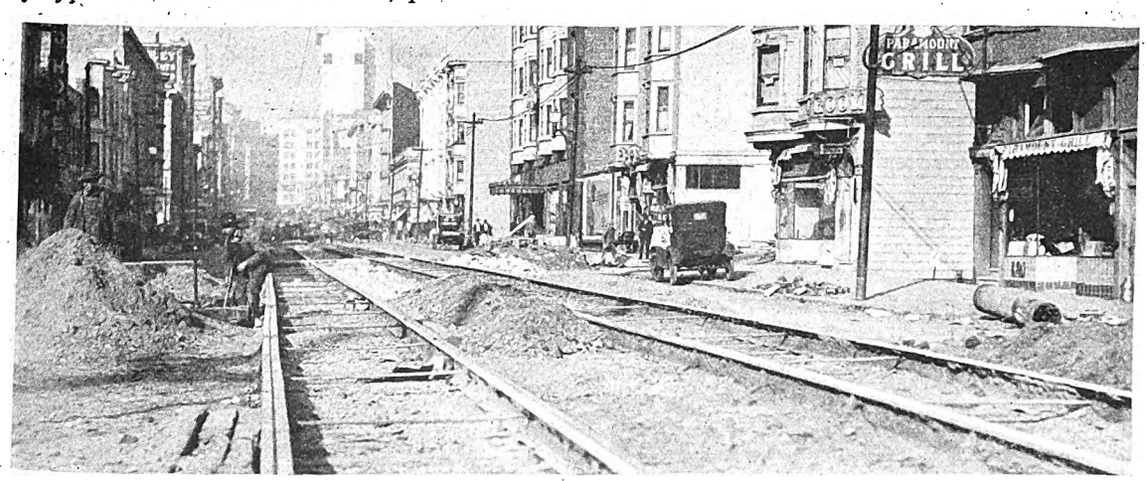
At present the company is working on two sections of track, one on East Sixth Street, where the track is being raised 3 ft., and the other on Folsom Street south of Fourteenth, where it is being raised a maximum of 12 in., with an average raise of 8½ in. The conditions on Sixth Street developed in just fourteen years. It was in 1912 that the track was brought to grade, and now in 1926 it must be raised a maximum of 3 ft.

On Folsom Street between Fourteenth and Sixteenth a total of 2,420 ft. of single track is being raised a maximum of 12 in. As this track is of the more recent type, incorporating concrete stringers between ties and the heavy type of rail on redwood ties, particular care was exercised to save as much of the original construction as possible in order to do the job economically and speedily. On Sixth Street the track construction was not of the present standard and the entire track structure was torn down and rebuilt to the higher grade.



The compressor outfit is placed so that it can serve approximately 900 ft. of track. Air-operated concrete cutters and ballast tampers are used

Standard track construction calls for a 9-in., 106-lb.



Extensive track raising to bring it to a new grade is required periodically in San Francisco because of the sinking of the filled land

Digitized by Google

grooved girder rail carried on untreated redwood ties spaced on 2-ft. centers. This track is carried on 9-in. ballast under the tie and a transverse concrete stringer 6 in. deep poured around and under the rail and between the ties. A typical cross-section is shown in an accompanying illustration. A 2½-in. asphalt wearing surface without headers is laid on top of the concrete. This type of construction was used on Folsom Street.

Preparatory to raising the tracks, the wearing surface is removed between the outside rails and 2 ft. on either side. The device used for removing the asphalt from between the rails expedites the work and is economical.

Typical cross-section of standard track used on paved street in San Francisco. The portion of concrete base and stringer saved is indicated. It also shows how the track structure is raised and the ballast added between the concrete and the original ballast

It was built several years ago. A steel plate about 3 ft. square with a sharp cutting edge in front is riveted to a tee-rail which is connected to the coupler of a motor work car. The sharp front edge of the plate rests in the track on the paving base. To the plate is attached a wood runway 5 ft. wide leading up over the end board of the car. The apparatus is on an incline of about 30 deg. with the horizontal. The lower end of the apparatus is provided with a pair of car wheels which rest on the rails and prevent the scoop from digging in too deeply when there is no paving base. The car is run ahead, forcing the sharp edge of the plate under the asphalt sheet, causing it to move up the incline into the car. It is possible to operate this car under favorable conditions at about 3 m.p.h. The remainder of the asphalt wearing surface between tracks and the outside is cut away with hand picks and shovels.

After the wearing surface is removed a trench approximately 12 in. wide is cut through the concrete base and stringer at the center of each track. Also the concrete is cut away on the outside of the rails. This exposes the ends of the ties and also a short section at the center. As the track is carried on rock ballast, it is possible to jack up the entire structure, the concrete moving intact with the rails and ties. New ballast is dumped in and around the track construction and tamped into position by pneumatic tampers. Original construction calls for 9-in. ballast under the tie at the rail. It will be seen from the accompanying illustration that with a maximum raise of 12 in. the ballast at that point will amount to 21 in. This would be the method of building up the grade where the elevation does not exceed 12 in. Beyond this, however, it would be impracticable and uneconomical to use rock ballast for the fill. Ordinary earth fill would be used, making allowance for a 9-in. ballast bed on top to carry the track. Air for operating the ballast tampers and also the concrete cutters for removing concrete in the trench and around the end of the ties is furnished by a compressor outfit. It is driven by an electric motor and the entire outfit is mounted on a framework and skids housed in and provided with a link on top, so that the crane may move it from place to place. It is set alongside the track and connected to 450 ft. of pipe so that 900 ft. of track can be tamped at one setting. Four tampers are used at each tie. Six men and a foreman tamp about 200 ft. of single track per day. A special trolley pole with a horizontal extension arm and pan makes contact with the under side of the trolley wire so that cars can pass without removal of the pole.

With the track in position at its new elevation, concrete is poured to complete the work, allowing for the 6-in. base and the 6-in. stringer under the rail. The company uses a small concrete mixer of its own for this work. However, the paving surface is laid by an outside contractor, the company finding it economical to have this work done outside. The company maintains a plant in connection with its material yard where it prepares asphalt compounds for patch repair work.

Considerable economy has been effected in track reconstruction work by saving as much of the original concrete construction as is possible. The concrete which is saved has already been referred to. Approximately $1 per lineal foot of track is saved in materials and labor, or approximately 30 per cent of the cost of replacing all concrete with new.

Concrete base and stringer are retained around each rail

The view at the left shows the double track on Sixth Street while being raised a maximum of 3 ft. The fill on this particular job was made with gravel.

As shown in the view at the right, in raising the modern track sections the concrete base and stringer are retained around each rail at a saving of approximately $1 per lineal track foot. The concrete is cut away from the end of the tie and in a trench between the rails. It is then possible to jack up the track structure and tamp in and around the ties under the rail with the air tampers connected to a compressor outfit.

While track elevation work is carried on, temporary crossovers are located at each end so that single-track movement of traffic may be operated. These crossovers as built by the company are in three sections and may be moved by the derrick car.

Rigid Construction Will Not Solve All Track Problems

NEWARK, N. J., Aug. 3, 1927.

To the Editor:

There is one subject connected with electric railway track construction in paved streets which will probably never cease to draw fire from the adherents of one type whenever arguments are offered by those of the other type as to why the party of the first part is all wrong. I refer to the subject of so-called resilient versus the so-called rigid type of track construction, and the occasion of this letter is the abstract of the paper by A. C. Irwin of the Portland Cement Association, presented at the summer meeting of the Central Electric Railway Association, and which appeared on page 69 of the July 9 issue of the ELECTRIC RAILWAY JOURNAL.

This letter is not intended as a brief for improperly constructed wood tie track nor in favor of its use under certain exceptionally poor subsoil conditions. There are and always will be exceptions to all rules. There are times when it is necessary to choose between two evils, and naturally the lesser will be selected.

Generally speaking, however, stone-ballasted track built with pressure-treated creosoted wood ties properly spaced, with a rail suitable for the traffic and with joints welded according to recognized good practice, will give excellent results. The secret of its success lies in the proper preparation of the subgrade, selection of proper kind of stone ballast and grading of same and thorough tamping of the ballast under the ties, taking care to see that in removing surplus ballast from between the ties before placing the concrete the ballast is not disturbed below the bottom of the tie.

A source of frequent trouble is the fact that some engineers think any mixture of stone, sand and cement is good enough for a track structure. Such is not the case, and it is just as important that properly proportioned and properly mixed concrete be used in the track structure as in any other.

The next item is in the selection of the type of pavement and the details of its installation. It is quite generally admitted that the ideal type of pavement for street railway track, and the most economical in ultimate cost, is the best quality of granite that can be obtained, and it is also becoming more and more generally recognized that an asphalt mastic filler provides the best seal against the passage of surface water to the track substructure and at the same time materially reduces noise from car operation.

A track such as described above will, under ordinary subsoil conditions, give many years of satisfactory service and has the additional advantage of offering a maximum salvage value when the necessity to rehabilitate the track arises.

Mr. Irwin makes the following statement in his paper, to which the writer desires to take exception: "There is *only one reason* why railroad track gets out of surface, and that is that the foundation is not strong enough to support the loads put upon it. In other words, track construction is not given anywhere near the stability that is demanded for a bridge or a building of even a minor character. The fact that the rails of a car track become low with respect to the adjacent pavement surface *proves just one thing,* that there is an inadequate engineering structure supporting those rails."

Barring from the discussion the exceptional conditions previously admitted, railroad track also gets out of surface because the subgrade was not properly compacted in the first place, because the ballast was neither properly graded nor tamped, because surface water has been permitted to reach the subgrade and not properly drained off, because of the effect of excavations under the track by other utilities, because of settlement caused where large sewers or other underground structures under the track area frequently prove defective, and other similar conditions.

Regarding what may be proved by the fact that street railway rails sometimes become lower than the adjacent pavement, the writer has frequently seen instances of rails lower than the adjacent pavement, due to the action of frost heaving the adjacent pavement and not to any settlement of the rails. I have also seen many instances of where such adjacent pavement was originally laid higher than the street railway rails and against the protest of the street railway representatives. So it is evident that the condition cited by Mr. Irwin may prove any one of several things, rather than "just one thing."

In discussing rigid versus resilient track construction, it might be well to consider briefly what takes place in a track structure. Unless a rail is absolutely uniformly supported throughout its entire length it will deflect between supports under a wheel load. That a rail is not so uniformly supported, even in so-called rigid track, must be admitted; therefore, there is a deflection, whether appreciable, as in open track, or relatively small, as in paved track. This deflection moves along as a wave in the rail as the wheel advances. Anything that is done to interrupt or prevent this wave motion is going to create unusual stresses in some part of the track structure. If you try to restrict it entirely by building so-called rigid track (concrete beam or steel tie and concrete construction), it will sooner or later be found that ties have been deformed at the rail bearings, rail fastenings have failed or the concrete under the rail base has become pulverized. By restricting the wave motion, excessive internal stresses in the rail and its joint have been formed which usually aggravate the occurrence of rail corrugation and joint troubles and make a noisy track.

Many engineers have found out through costly experiments during the past 25 years that rigid track is not the cure-all for street railway track ills and have gone back to a type of construction with wood ties substantially along the lines indicated at the beginning of this communication. It is a well-known fact that an anvil is always mounted on a resilient base, and if this were not so the life of the anvil would be short. A track structure is subjected to very much the same kind of stresses as an anvil, and the theory which holds true for the anvil is equally good for the track structure.

Lewis C. Mayer Wins July Prize

Anti-creeping anchors for double-track crossings receives $25 monthly prize for July in the *Electric Railway Journal's* maintenance competition. Honorable mention given to Louis T. Botto for description of "Keeping Paving in Good Condition with Little Money" and to Angus G. Scott for description of "Trolley Reel for Emergency Trucks"

THE problem of keeping steam road crossings in line is one of the most difficult experienced by electric railways. It is usually the electric railway alignment which suffers most, and the ordinary anti-creeper devices employed by steam roads do not, as a rule, solve the problem satisfactorily. The method described by Lewis C. Mayer in providing anti-creeping anchors for double-track crossings was considered as offering a real suggestion to track maintenance men which can be used on other railway properties to advantage, and this was given the $25 monthly award by the judges. The method described stood a test of three years on some crossings of the York Railways with a steam line and seems to have solved the problem satisfactorily. The design of anti-creeping anchor described should be comparatively easy to apply to any section of railroad at a reasonable expenditure.

The method for keeping paving in good condition with little money described by Louis T. Botto is a simple expedient which has produced good results at small cost. If the various kinds of defects in pavements are not repaired at the beginning, they soon become a serious problem, with the final result of making it necessary to lay new pavement. The item of paving repairs is a large one and any method of cutting this cost is a great benefit to the industry. The judges of the twelve articles published in the Maintenance Data Sheet section of the ELECTRIC RAILWAY JOURNAL for July 16, 1927, decided that honorable mention should be divided between the method described by Mr. Botto and and the item "Trolley Reel for Emergency Trucks" submitted by Angus G. Scott.

The trolley reel offers a most ingenious and practical arrangement for handling trolley wire and the braking device to provide the necessary tension in the wire while stringing is also to be commended. It should facilitate the entire operation and can be adapted to practically any city property. The usual practice of electric railways is to carry a coil of trolley wire on the side of the tower. This is very awkward to handle, and if but a few sections of wire are to be run in, the method described of carrying the wire is simple and facilitates greatly its erection.

Competition for the July prize was very close. Twelve articles were published in the Maintenance Data Sheet section of ELECTRIC RAILWAY JOURNAL for July 16, 1927. Additional items appear in the following pages. One of these will be awarded the $25 monthly prize for August. With this installment 42 of the items submitted in the maintenance contest have been published. There still remain more than 60. These will be published as fast as space permits. All are being turned over to the judges and an early decision will be reached in awarding the capital prizes of $200, $100 and $50, the winners of which are to be announced in the annual convention issue of the ELECTRIC RAILWAY JOURNAL, to be published Sept. 17, 1927.

The contest is still open for articles to be submitted for the monthly prizes. These may be sent in any time up to April 30, 1928. Full information regarding the rules of the contest was given in the April 16, 1927, issue of ELECTRIC RAILWAY JOURNAL, pages 700 and 701, and condensed rules and instructions for the contest have been published many times since then. Contestants should read the rules carefully in order that they may comply with all conditions.

Lewis C. Mayer
